Mr. MINOR. I am a civil engineer. I do estimating.

Representative HOLIFIELD. At the rates given here, according to the regular accepted schedules of rent charged in relation to income, I would say that your \$15 or \$20 a month rent was very cheap, compared to the amount that would be paid in a city, ordinarily.

Mr. MINOR. Well, I have been the owner of property in this section of Tennessee and in the central section of Tennessee, and when I rented the property to a man I never asked him what his income was, and he probably would have been insulted if I did. The income of the prospective tenant is not a part of a rental agreement.

Representative HOLIFIELD. No. That is true.

Mr. MINOR. I owned apartments and real estate in this section of Tennessee at the time that this plant was conceived.

Representative HOLIFIELD. Do you own property now?

Mr. MINOR. Not in this particular section.

Representative PRICE. Where is your home?

Mr. MINOR. Twenty-eight miles west of Nashville.

Representative PRICE. You are a native of this area, then?

Mr. MINOR. That is right. I am a Tennessean. I wasn't born in Tennessee. My people came from Virginia.

Representative HOLIFIELD. You do not live here in this city?

Mr. MINOR. I live on the area. I live in the same type of dormitory that the rest of them live in, with the exception that they have the word "hotel" stuck on it. But it is nothing but an S-type dormitory. I pay \$50 a month for a room that has never known paint except for the border around the ceiling.

Representative PRICE. I notice some mention of the \$50 rooms. Where are they?

Mr. MINOR. They are at Rutherford Hall.

I have an idea that this is the difference between a \$50 room at Rutherford Hall and anywhere else: On the days when you have hot water, you have no lights, and on the days when you have lights, you have no hot water. Yesterday and today we had no hot water. The 2 days before that, we had no lights. [Laughter.]

So that possibly is the difference.

I lived at Cambridge Hall down here last year, and that cost me \$25 a month, for a far superior room to what I get at Rutherford for \$50. And, of course, the only reason that I did not go back to Cambridge Hall was the fact that I could not get a room there. My room was vacant when I came back here to get it, but it had been blocked off. So it remained vacant.

Representative HOLIFIELD. These rates are the original rates?

Mr. MINOR. Those that were established by the Army. You will get some contradictions, perhaps, on that \$30 rate, but that rate was established by the Army for dual occupation of the Cambridge Hall.

Representative HOLIFIELD. It is true that throughout the Nation the rent-control authorities have recognized, and Congress has recognized, that certain percentage increases were due to the landlords for the same quarters. There have been several raises, 15 percent raises, and so on, throughout the last 3 or 4 years as a result of that recognition.

Mr. MINOR. Might I ask you this question, at this point.

Inasmuch as all the leading officials of AEC have stated that the only item that is to be considered is comparability, is that not the basis for any change of rate structure?

Representative HOLIFIELD. If they say so, I assume that you are right.

Mr. MINOR. You have the letters there, in which you have Mr. Lilienthal, Mr. Pike, Mr. Wilson, Mr. Williams, on record, and in the letter that the chairman has there is a transcript of our meeting with Mr. Ford, and you will find Mr. Ford saying the same thing.

(The letters referred to are as follows:)

UNITED STATES ATOMIC ENERGY COMMISSION,  
Washington 25, D. C., March 30, 1949.

HON. ALEXANDER WILEY,  
United States Senate, Washington 25, D. C.

DEAR SENATOR WILEY: Reference is made to your letters of February 23 and 24 which concern the dormitory situation at Oak Ridge, Tenn. These letters were transmitted to Mr. Tighe E. Woods, Housing Expediter, and have been referred through the Administrator, Housing and Home Finance Agency, to the Commission as a matter coming under its jurisdiction.

There are in operation at Oak Ridge 14½ dormitories which house a little more than 2,000 residents at Oak Ridge. The Roane-Anderson Co. operates the town of Oak Ridge for the Commission on a contract basis and receives an

over-all fee for this work that is not changed by adjustments in rents or services for such operations as the dormitories. Roane-Anderson on February 1, 1948, subcontracted the operations of certain dormitories in Oak Ridge to the James H. Moore Co. on a lump-sum basis after receiving competitive bids. Under the terms of the subcontract the Moore Co. is responsible for routine maintenance work but the Roane-Anderson Co. continues to perform certain major maintenance work. Renegotiation of this contract does not increase rental charges to dormitory residents but curtails some of the services previously provided and eliminates others.

The Commission has recently adopted the policy of charging rents and supplying services which approach those prevailing in the vicinity of Commission installations. This action of the Commission was taken in order to approach conditions existing in normal communities in the country and to reduce discrepancies in rents paid by employees living on and off the site. Careful study was made by the Commission of the rents charged and services provided for comparable accommodations in the vicinity of Oak Ridge. Specific action of curtailing or eliminating services to dormitory residents at Oak Ridge was based on the results of the study.

Some reduction of expense in operating the dormitories will result. However, the estimated savings in cost of operating the dormitories resulting from the curtailed services which became effective on March 1 will not accrue to the Moore Co. but to the Commission. Under the old basis of operating the dormitories prior to March 1, 1949, the cost to the Commission was estimated at approximately \$278,099 per annum. It is estimated that the new basis of operation will reduce this cost to approximately \$148,119 per annum.

Any further information concerning this situation will be supplied at your request.

The enclosures which were attached to your letters are returned with this letter as was requested.

Sincerely yours,

UNITED STATES ATOMIC ENERGY COMMISSION,  
DAVID E. LILIENTHAL, *Chairman*.

---

UNITED STATES ATOMIC ENERGY COMMISSION,  
*Washington 25, D. C., March 30, 1949.*

Hon. R. E. JONES, Jr.,

*House Office Building, Washington 25, D. C.*

DEAR CONGRESSMAN JONES: Reference is made to your letter of February 21, 1949, enclosing a letter from W. H. Minor, chairman, Central Committee of Oak Ridge Dormitory Residents, concerning the Oak Ridge dormitory rental problem.

There are in operation at Oak Ridge 14½ dormitories which house a little more than 2,000 residents at Oak Ridge. The Roane-Anderson Co. operates the town of Oak Ridge for the Commission on a contract basis and receives an over-all fee for this work that is not changed by adjustments in rents or services for such operations as the dormitories. Roane-Anderson on February 1, 1948, subcontracted the operations of certain dormitories in Oak Ridge to the James H. Moore Co. on a lump-sum basis after receiving competitive bids. Under the terms of the subcontract the Moore Co. is responsible for routine maintenance work but the Roane-Anderson Co. continues to perform certain major maintenance work. Renegotiation of this contract does not increase rental charges to dormitory residents but curtails some of the services previously provided and eliminates others.

The Commission has recently adopted the policy of charging rents and supplying services which approach those prevailing in the vicinity of Commission installations. This action of the Commission was taken in order to approach conditions existing in normal communities in the country and to reduce discrepancies in rents paid by employees living on and off the site. Careful study was made by the Commission of the rents charged and services provided for comparable accommodations in the vicinity of Oak Ridge. Specific action of curtailing or eliminating services to dormitory residents at Oak Ridge was based on the results of the study.

Some reduction of expense in operating the dormitories will result. However, the estimated savings in cost of operating the dormitories resulting from the curtailed services which became effective on March 1 will not accrue to the

Moore Co. but to the Commission. Under the old basis of operating the dormitories prior to March 1, 1949, the cost to the Commission was estimated at approximately \$278,099 per annum. It is estimated that the new basis of operation will reduce this cost to approximately \$148,119 per annum.

Any further information concerning this situation will be supplied at your request.

UNITED STATES ATOMIC ENERGY COMMISSION,  
*April 4, 1949.*

HON. LYNDON B. JOHNSON,  
*United States Senate, Washington 25, D. C.*

DEAR SENATOR JOHNSON: Reference is made to your referral of a letter from W. H. Minor, Chairman, Central Committee, Oak Ridge, Tenn., and facts pertinent to Oak Ridge dormitories. This letter and listing of facts concerned recent action by the Commission in eliminating or curtailing certain services in connection with the dormitory operations at Oak Ridge, Tenn.

There are in operation at Oak Ridge 14½ dormitories which house a little more than 2,000 residents at Oak Ridge. The Roane-Anderson Co. operates the town of Oak Ridge for the Commission on a contract basis and receives an over-all fee for this work that is not changed by adjustments in rents or services for such operations as the dormitories. Roane-Anderson on February 1, 1948, subcontracted the operations of certain dormitories in Oak Ridge to the

James H. Moore Co. on a lump-sum basis after receiving competitive bids. Under the terms of the subcontract the Moore Co. is responsible for routine maintenance work but the Roane-Anderson Co. continues to perform certain major maintenance work. Renegotiation of this contract does not increase rental charges to dormitory residents but curtails some of the services previously provided and eliminates others.

The Commission has recently adopted a policy of charging rents and supplying services which approach those prevailing in the vicinity of Commission installations. This action of the Commission was taken in order to approach conditions existing in normal communities in the country and to reduce discrepancies in rents paid by employees living on and off the site. Careful study was made by the Commission of the rents charged and services provided for comparable accommodations in the vicinity of Oak Ridge. Specific action of curtailing or eliminating services to dormitory residents at Oak Ridge was based on the results of the study.

Some reduction of expense in operating the dormitories will result. However, estimated savings in cost of operating the dormitories resulting from the curtailed services which became effective on March 1 will not accrue to the Moore Co. but to the Commission.

Under the old basis of operating the dormitories prior to March 1, 1949, the cost to the Commission was estimated at approximately \$278,000 per annum. It is estimated that the new basis of operating will reduce this cost to approximately \$148,119 per annum.

Any further information concerning this situation will be supplied at your request.

The enclosures which were attached to your letter are returned with this letter as was requested.

Sincerely yours,

UNITED STATES ATOMIC ENERGY COMMISSION,  
SUMNER T. PIKE, *Acting Chairman*.

So we have all of the leading officials of AEC stating that. The introduction of any additional figures, the addition of anything except comparability, seems to me to be lost motion. For they are on record. And I have read to you the statements of people here that comparability is the only thing.

Representative DURHAM. Well, Mr. Minor, we have given you about an hour and 10 minutes, and we have other witnesses to be heard.

I believe if there are no other questions, we will proceed with the next witness.

Mr. MINOR. Thank you, Mr. Chairman.

Representative DURHAM. I believe Mrs. Edwards is the next witness to be heard.

Will you tell us who you are, and whom you represent?

#### STATEMENT OF MRS. ALICE EDWARDS, SCHOOL TEACHER, JEFFERSON JUNIOR HIGH SCHOOL, OAK RIDGE, TENN.

Mrs. EDWARDS. I am Mrs. Alice Edwards, a school teacher, from Jefferson Junior High School, and I am representing women dormitory residents.

Representative DURHAM. Have you a prepared statement that you want to read to the committee?

Mrs. EDWARDS. Mr. Durham, I would like to continue the argument which Mr. Minor has started in presenting our ideas of comparability. Then, if I may, I would like to digress and talk about another angle of dormitory life in Oak Ridge, if you will allow me.

Representative DURHAM. He has covered comparability pretty thoroughly, and if you have something new to introduce, I would suggest that you proceed along that line, unless you feel that there is something that you can add to the matter of comparability.

Mrs. EDWARDS. I would like to add one point to what Mr. Minor said.

Representative DURHAM. You may proceed and then take up the other question that you have in mind.

Mrs. EDWARDS. One additional thought should be added, and that is related to the picture of comparability. The dormitories at the University of Tennessee are available only to the students at the university. The rooms at the YMCA in Knoxville are available only to people 30 years of age or under. The dormitories at Watauga Dam are available only to the workers on the dam. The dormitories at Oak Ridge, on the other hand, are open to all workers, students, and others, having business in or doing business in Oak Ridge.

In this respect, and in this respect only, they are similar, though not comparable to Knoxville hotels.

Representative DURHAM. Right at that point, Mrs. Edwards: Who selects the residents for the women's dormitories? If a store clerk comes in, and you have a room available, you rent it to her? If a teacher comes here, and you have a room, you rent it to her?

Mrs. EDWARDS. All single people, Mr. Durham, must live in dormitories in Oak Ridge. There is no other recourse. If we want apartments, and we are single, we are penalized for that.

Representative DURHAM. There are no special dormitories set aside for teachers?

Mrs. EDWARDS. No, and none for single people. They must live in the dormitories with the others.

Now I would like to present another point, which seems a very important point to those of us who live in the dormitories.

I think all people, all of us, should be concerned with the fact that the individual is the most precious thing on earth. This is the cardinal principle of democracy, the cardinal democratic concept. How could we, in the Oak Ridge dormitories, suffer injustice, discrimination, or class struggle, if the people in AEC, Roane-Anderson, and the J. H. Moore Co., set a high value on human beings? Why shouldn't we here in Oak Ridge be allowed to choose the type of housing that we wish to have? Why is a person told, when he makes application for housing, that he is not important enough; that his salary or his contribution in his job merits one kind of housing or another; or that he doesn't know the right kind of people, or the "right people," who might secure for him a better type of housing?

Representative DURHAM. Is that not kind of a characteristic of Government employment?

Mrs. EDWARDS. I do not know. But it is a characteristic here.

Why shouldn't my Government honor my ambition to live in the best house that Oak Ridge affords, if I can pay the rent, even if I work on the garbage force? Doesn't this practice, this class distinction in Oak Ridge revert to the feudal system, and does it not conflict with all American ideals and democratic principles for which two young men in my family and thousands of others like them gave their last full measure of devotion in our last war?

Dormitory residents in Oak Ridge have contributed a great service here during and since the war. They have worked long hours, many times in a dangerous situation. They return to their dormitory rooms, very small, unattractive, bare rooms, with uncomfortable furniture, either overheated or too cold, to rest, in extreme noise, so that the job may have a worker the next day.

The human touch is nonexistent in the life of an Oak Ridge dormitory resident. I think that we need to stress again the importance of saving money by correcting in Oak Ridge indiscriminate waste, duplication of service, 2 and 3 and often 6, 8, and 10 men piddling along on one small insignificant job, such as putting in a light bulb, putting out rat poison, screwing in or tightening a water faucet. A great many dollars are being wasted every day in Oak Ridge. We in the dormitories are paying the piper.

Our services have been taken away from us. If a fire should come, there would not be a chance, during the time that there is no clerk, of saving human lives.

A girl next door to me, a month ago went away and left her iron on in her room. She had been pressing where she shouldn't have pressed. We have a great many types of individuals in the dormitories. I smelled something burning. I rushed frantically into the halls to try to locate it. I happened to be present. The clerk was on duty but in a different place. We searched for her until she came running and unlocked the door. There was a ball of fire that greeted us. In 10 more minutes, my wall, where my room is located, and where my clothes are hanging in closets without doors, would have been in flames.

When we take off the service, we put every person, 2,000 people, in a dangerous situation. When we take away the maid service some people will clean their rooms. A great many people do not have time to do that. So we will have filth and disease and bugs and all the other things that make life in a dormitory unbearable.

Representative DURHAM. Does that complete your statement?

Mrs. EDWARDS. I have digressed to talk about another angle. I think Mr. Minor has completely covered the comparability angle, and others will pick up from there.

Representative DURHAM. Any questions? Mr. Holifield?

Representative HOLIFIELD. No questions.

Representative DURHAM. Mr. Price?

Representative PRICE. No questions.

Representative DURHAM. Thank you very much for your statement, Mrs. Edwards.

Mrs. EDWARDS. Thank you.

Representative DURHAM. Is there any more representation here of the dormitory committee?

We can give you 5 minutes, if you would like to come around, the two of you.

Have a seat and give your name to the stenographer.

#### STATEMENT OF MYER BENDER, REPRESENTING BOONE HALL DORMITORY RESIDENTS, OAK RIDGE, TENN.

Mr. BENDER. My name is Myer Bender.

Representative DURHAM. And whom do you represent?

Mr. BENDER. I represent the Boone Hall Dormitory residents. I have been living in Boone Hall for the past 2 years. Prior to that I lived in Covington Hall. and before that I was a member of the armed forces here in Oak Ridge.

I have watched the dormitory situation grow from its inception, almost. I have seen it grow from the time when this community was

trying to house 75,000 people, to a point where now we have a group of 2,000 residents able to live in dormitories which encompass the entire area; of which fact you gentlemen are surely aware.

There is in Oak Ridge sufficient dormitory space to house every available single person on this area if those persons desired to live there. The question has been raised whether we are not penalizing the individuals who live outside of the area by having rental rates which are comparable to those on the outside of the area, though these rates are made available in Oak Ridge, close to the working area. I say to you that the area which we live in has sufficient facilities to house those people, and that they are not being handicapped by such facilities. Consequently, any claims on that basis, I think, are unfounded.

Representative HOLIFIELD. You base that argument on the premise that if they wanted to, they could get space here and they go out as a matter of choice?

Mr. BENDER. Yes, sir.

Representative HOLIFIELD. In other words there are in existence now enough vacant dormitory rooms to give to these single people who are going outside to live.

Mr. BENDER. Yes, sir; more than three times enough.

I have here some questionnaires, which I do not intend to explain or to go into deeply, because I feel Mr. Minor has gone into it very well. It is a questionnaire which I would like you gentlemen to look at, and to comment upon, if you please, or to take with you; and to ask the AEC or the Roane-Anderson Co., or whomsoever you choose whether such a document as this is not a real study of comparability, and, if so, whether such a study was made. We have on numerous occasions asked the people involved to present truthfully to us the study of comparability which they have made; and the greatest amount of information we have been able to obtain, although this thing is certainly directly affecting us more than anyone else, is this brief resume of comparability which was sent to the several members of Congress, and which you have in your exhibits there.

Representative PRICE. Who circulated this questionnaire?

Mr. BENDER. This questionnaire was prepared by the central dormitory committee. And I must admit that we were unable to get enough information in it to present you gentlemen with a full report because of the fact that we were acting in an unofficial capacity. However, I feel that in any study of comparability it would be quite possible for any certified consulting firm to obtain this information, and I believe they should do that.

Representative PRICE. But to whom did you send the questionnaire?

Mr. BENDER. They were sent to various hotels, to YMCA's throughout Tennessee and Virginia. Some of them replied; others did not. We did not have complete information, and could not get complete information to compile a complete summary. It would not have been fair, because we didn't get answers to all of them. However, if such a survey is to be made, it should be presented to the dormitory residents so that they can better understand how this thing can come about. As it is now, I think Mr. Minor has shown very well that the issue of comparability has not been settled by this little summary which was prepared by Mr. Wilson, and therefore the situation is certainly not clarified as yet.

Representative HOLIFIELD. Your thought, in showing us this, is to demonstrate that if such a system were followed, they would have a true picture? And you infer that no such system was followed in the chart which was presented to us?

Mr. BENDER. I have no way of knowing that, sir, but I certainly don't think so.

Representative DURHAM. A copy of this will go in the record.

Does that finish your statement?

Mr. BENDER. Yes, sir.

Representative DURHAM. Thank you very much.

(The questionnaire referred to is as follows:)

Representative DURHAM. We have one more member of the central committee to appear. Is that correct?

Will you come forward and state your name, please?

### STATEMENT OF ELIZABETH HILL, REPRESENTING RESIDENTS OF COLUMBIA HALL, OAK RIDGE, TENN.

Miss HILL. Miss Elizabeth Hill.

Representative DURHAM. Whom do you represent?

Miss HILL. I represent the residents of Columbia Hall.

Representative DURHAM. You may have a seat, Miss Hill, and proceed with your statement.

Miss HILL. As representing the residents of one of the Oak Ridge dormitories, and being familiar with the known history of the present issue, and having formerly lived in a college dormitory at the University of Tennessee, I, like many others, must take exception to the attempt to draw a picture of comparability between the facilities offered at Oak Ridge and the facilities that have been cited as comparable either in Washington, D. C., or in the Knoxville area.

The location alone would warrant a higher note of rent if, indeed, a higher note was asked; and, of course, a comparable note would be justified when measured alongside of the facilities offered at Oak Ridge. But even this is not true in the majority if not in all cases, for the rental asked is lower than or the same as we are paying here at Oak Ridge, while the facilities and services are far superior to anything that we have had or could hope to have.

Mail is one of the most important issues, and we do get it here at 10 o'clock in the morning. I believe Mr. Minor has already brought that out. But we can't get it until 4 o'clock in the afternoon. Many of us have already gone to work in the mornings when the mail arrives; and unless we are there between the hours of 4 and 10 we cannot get that mail, because the shift workers may not be able to do that if they work on the night shift.

Another annoyance that has recently been introduced is the \$2 fee for moving. I quote: "If the room to which you are assigned should prove to be unsuitable for any reason, and if you desire to move to a vacant room that promises to be more suitable, you are assessed a fee of \$2 if the move is approved."

However, if it is desired to close the dormitory in which you live, or if for any reason the dormitory operator wants you to move, you must move at your own expense, and there is no pay coming for the extra work that is involved to you of moving.

Representative DURHAM. How long have you been living here?

Miss HILL. I have been living here 8 months.

Representative DURHAM. What is your profession? Do you teach?

Miss HILL. I am a teacher.

Representative DURHAM. Any questions, Mr. Holifield?

Representative HOLIFIELD. No questions.

Representative DURHAM. Mr. Price?

Representative PRICE. No questions.

Representative DURHAM. Thank you, Miss Hill.

Miss HILL. Thank you.

Representative DURHAM. Does that complete your witnesses, Mr. Minor?

Mr. MINOR. Would you have a few minutes for one more?

Representative DURHAM. Yes; 5 minutes.

#### STATEMENT OF R. F. SMITH, RESIDENT OF BOONE HALL, OAK RIDGE, TENN.

Mr. SMITH. I am R. F. Smith, resident of Boone Hall.

I will make this as short as possible, since time is running out here. I do have a few figures that I would like to give, in the absence of any figures from AEC.

I have made a few estimates, and I think they are pretty good.

There are approximately 2,000 dormitory residents that pay an average of about \$17 a month per person, which would amount to \$408,000 in a year's time in the way of rental paid to the James H. Moore Co.

The cost of operation prior to March 1949 could not have been greater than \$333,132 per year, exclusive of maintenance costs.

This would leave a sum of \$74,000 to cover maintenance from the dormitory rental fees themselves for the year.

Representative HOLIFIELD. Are you including the cost of utilities in that figure?

Mr. SMITH. The cost of utilities is not included.

Representative HOLIFIELD. Then your figures are not an accurate reflection of the situation, if you have not taken into consideration the cost of the fuel, light, and water that is furnished you.

Mr. SMITH. As I understand from Mr. Moore's statement, those things seem to be supplied without any cost.

Representative PRICE. What is the source of your information on operating costs?

Mr. SMITH. I have based this, if you would like me to go into it, on the wages paid the maids, the wages paid the clerks, prevailing rates for laundry service, linen service, and so forth.

Representative PRICE. But what is the source of your information?

Mr. SMITH. The source of my information is contacts with different employees of the James H. Moore Co.—or at least previous employees of the James H. Moore Co.

Representative PRICE. Auditors? People who would have access to such knowledge?

Mr. SMITH. People that have worked for the James H. Moore Co. in the capacity of dormitory clerks, and also as maids.

Representative PRICE. Would they be likely to know such figures?

Mr. SMITH. I think they would probably know their rate of pay.

Representative PRICE. They would know their own rate of pay, but would they know the over-all operating costs?

Mr. SMITH. I was compiling the over-all operating costs from those particular items that I picked out.

Representative PRICE. Go right ahead. I was just trying to establish the source of your information.

Mr. SMITH. As I said, while the figures given are not taken from Government records, they cannot be greatly different from the actual cost.

This information that I have given you, of course, was for the period prior to March 1st of this year. Under present curtailed services, the cost of operation will not be greater than \$139,000, leaving a difference of \$268,000, or about 55 percent of the rent collected, to be paid out for maintenance and contractor fees by the James H. Moore Co.; the excessive amount to be accounted for is what I call incomparability.

That completes my statement.

Representative DURHAM. Thank you very much.

Mr. SMITH. Thank you.

Representative DURHAM. Does that complete your list of witnesses, Mr. Minor?

Mr. MINOR. Yes. I believe we have some people from the union here who want to speak.

Representative DURHAM. I believe the next witness is the representative of the Atomic Trades and Labor Council, Mr. Cooper.

Will you come around and have a seat, Mr. Cooper?

**STATEMENT OF TRAVIS COOPER, REPRESENTING ATOMIC TRADES  
AND LABOR COUNCIL, A. F. OF L., OAK RIDGE, TENN.**

Mr. COOPER. I am Travis Cooper, delegate from the Atomic Trades and Labor Council, A. F. of L.

Representative DURHAM. Do you live in a dormitory?

Mr. COOPER. Well, sir, I will bring you up to date on myself. I feel like I am a resident of Oak Ridge. I came here in 1944, the early part.

I lived in a dormitory during war conditions. At the present time I am in a house. There are not much better conditions in the houses than there are in the dormitories.

During wartimes, we had conditions in the dormitories about par to what they are now. The daily towel service, the daily maid service, wasn't there. You didn't have it then, and you haven't got it now.

We feel, as labor, that we helped build this place. We feel like these people are being shoved around. These conditions in these dormitories are rotten. If you gentlemen have been into them, you have seen what the walls are. You have seen the conditions they are living in. We feel that these people in the dormitories are putting themselves out to carry on a job which hasn't been completed yet; that there should be some inducements yet in Oak Ridge to keep these people here.

We people in Oak Ridge today have no voice whatsoever as to what goes on. It's "take it, boys, or leave it. That's it."

When we come down to the present comparability of this thing, we feel like somebody had reached out and grabbed hold of something to try to show up something. They have taken a town of 30,000 population, here, and have compared it with a city of 135,000 population, and they have taken these dormitories and tried to make them comparable to the YMCA accommodations.

You have to be "it" to get into the YWCA or the YMCA. You have to have the background to get into them. As for these people in the dormitories, we have good people there, and we have all kinds of people there. They are living there under all conditions, and when they take the watchmen off and take the maids off, you gentlemen can certainly see what these people are going into. They have no security of jobs. They have no security, when they come back at night, that the stuff in the rooms is going to be there. Every maid that has worked in there, every maid that has ever worked there, still has her key. These people can leave nothing in their rooms. Even their treasured things of life, their mementoes, and things like that, they must carry out. You don't know what is in the next room to you.

But we feel, as labor, that somewhere along the line, the people who have made Oak Ridge, who are making Oak Ridge, should have some concessions in this matter.

We feel, in this matter of comparability, that if you go out to a town of, say, 30,000, and look into this matter, you will get at the solution of it. Where that town is, I don't know. The nearest I can get to it is, let's say, Murray, Ky., a little town of twenty-thousand-some people, more or less, the headquarters of TVA in that section. It is a college town. It is a merchandising town. Check the dormitories within that college.

I am not going to give you the figures, but check them. Check the dormitories in that town, which is a college town. You have TVA workers in that town in dormitories. Check those. They have something there to live for. The rent is lower. Conditions are better. And you do have stability, which you don't have here.

As I say, under war conditions, in our dormitories here it wasn't much better than it is now.

We can't see any need to go into the argument as to whether two operating companies are needed in this thing; or as to Roane-Anderson, whose \$16,000 per month people are paid to operate this. But why should it be subcontracted to some other company to make their profit?

Representative DURHAM. Do you think it would be better to sell this out to private industry and let them run it?

Mr. COOPER. That is your business.

Representative DURHAM. If we are not running it right, we hope to work out the problem so that somebody else will run it right, you see.

Mr. COOPER. Well, if you put it in that light——

Representative DURHAM. We realize we have a job to do, and we are depending on you people, and what we are trying to do is to solve the problem.

Mr. COOPER. Well, solving the problem is certainly not taking these services away, or raising the rents on these people. You might just as well cut their salaries. That is what it amounts to.

Representative DURHAM. That is what I say. If we are running it wrong, we want somebody else to run it right.

Mr. COOPER. I am not saying you are running it wrong; but as far as the dormitories themselves are concerned, now, certainly somebody is wrong. [Applause.]

Representative DURHAM. What I am getting at is that this is a Government-owned project; and, of course, we have a responsibility, as you can understand, and a very serious one, and we want the people satisfied in every respect. Because we have to depend on the laborers to run this project. We have got to.

Mr. COOPER. Well, to get into these dormitories, now, all a man has to do is to be employed. That is the first thing. He has to be employed by someone. It doesn't make any difference who. I have a Negro maid. She is in the dormitory. There is no concession made. All are employed somewhere. But to disenfranchise these people from the thing they have built up, and helped build, and to take this away from them, to thereby cut their earnings, is just like taking bread out of their mouths.

Representative DURHAM. I suppose these are correct figures, showing \$3,150 as the average annual earnings here.

Mr. COOPER. I don't believe it will average that.

Representative DURHAM. Of course, I am not arguing with you.

Mr. COOPER. Being in a position to handle quite a few pay-roll checks weekly, and taking them average, week after week—I am not speaking of the big salaries; I am speaking of the hourly workers—I have taken our vouchers over the last 5 weeks, and I have run an average of 500 checks, and they average \$37.50 per week take-home pay.

Representative DURHAM. But it ought to be easy to get the over-all

average, because there is a record here, and it should be official, as to the over-all earnings. I am just quoting these figures as given here by Mr. Wilson. Of course, he is General Manager. That average is, of course, way above the average throughout the country, as you know. The over-all national average is around \$2,000 to \$2,100, I believe, at the present time.

Of course, in some cities, it would probably run above this, but very few in the country.

Representative PRICE. Have there been any wage increases here since the war?

Mr. COOPER. Yes, there have.

Representative PRICE. What has been the history of that?

Mr. COOPER. There was a voluntary wage increase of, I think, 15 percent back in 1944 or 1945, and there were different negotiated wage increases amounting, on the over-all, to about 5 percent, in the last year.

Representative PRICE. You indicate that there have been wage increases of about 20 percent. That was the hourly basis?

Mr. COOPER. I am speaking only of the hourly basis.

Representative PRICE. Has there ever been an increase in rental here?

Mr. COOPER. Yes. When you take away the privileges and take away the services, there is an increase, definitely.

Representative PRICE. Was that the first increase in the rental structure?

Mr. COOPER. I believe so; yes, sir. And speaking now of housing, when it comes to maintenance, that must be paid by the people themselves, who are definitely having to foot the bill.

Representative PRICE. Would you say the maintenance of these dormitories has been bad?

Mr. COOPER. Bad? That won't say it. It won't say it. And the gentleman there was speaking about the cost of people turning off valves, and so forth, \$2.25. They don't get that for turning off valves in these dormitories. The average is \$1.61½.

Representative DURHAM. That was a comparison from the outside, of course.

Mr. COOPER. The maintenance in these dormitories is bad. The maintenance in some of the houses is bad.

Representative PRICE. You mentioned something about there being a lot of keys in circulation to the rooms of the different dormitories, because of the help that may have been on and off at different times. What has been the record for thefts?

Mr. COOPER. That's security. You can't find out. [Applause.]

Representative PRICE. In your opinion, do you think there has been quite a bit of that?

Mr. COOPER. I know there has.

Mr. MINOR. I lost 12 shirts in the first 3 months that I was on the area, from the drawers in my room.

Representative PRICE. What about your police here?

Mr. COOPER. Very efficient.

Representative PRICE. Information as to that might possibly fit well into the record at this point.

(The information referred to is as follows:)

UNITED STATES ATOMIC ENERGY COMMISSION,  
Oak Ridge, Tenn., May 21, 1949.

#### GENERAL POLICE EFFECTIVENESS

Oak Ridge police have a long record of effective law enforcement. Most noted of the recognition afforded them is the Award of Merit of the National Safety Council to the city of Oak Ridge for 1945, 1946, 1947, and 1948. For the past 2 years Oak Ridge has been cited for the top traffic safety performance in the Nation. For 1948, the National Safety Council said the city of Oak Ridge was top or near the top in each phase of the traffic safety program (one of which is effective law enforcement); 1,253 days have passed since the last traffic fatality in Oak Ridge. Oak Ridge police also have maintained an excellent record of automobile recoveries, stolen-property recoveries, and cases solved.

#### DORMITORY THEFTS

Since June 1, 1947, there has been 30 thefts in dormitories reported to police. A total value of \$1,018.38 was placed on the property stolen in these cases. However, dormitory thefts represented less than 4 percent of all thefts in Oak Ridge and about 3 percent of all property stolen was involved in dormitory thefts. Of the \$1,018.38 stolen during the 2-year period, two thefts, one of \$364 and one of \$250 counted for about 60 percent of the property loss. The remaining 28 cases resulted in a loss of only \$404.38 or an average of about \$16 per dormitory theft. A total of 21 dormitories were in operation at some time during this period so there was an average of less than one theft per dormitory reported to the police each year. (There could have been additional thefts, but, if so, the victim did not report the loss to the police.)

Police closed 7 of the 30 dormitory theft cases with results while 400 of the 837 theft cases in the city were closed with results (23 percent as compared with 48 percent). This low figure of results obtained is offset by the fact that \$648.62, or 63 percent of the \$1,018.38, was recovered by police while only 56 percent of all property stolen in Oak Ridge was recovered.

For 1947, the last complete year for which figures are available, the publication, Uniform Crime Reports issued by the FBI, says that police recovered 24.7 percent of stolen clothing, 21.3 percent of stolen jewelry, 14.7 percent of stolen money, and 31.9 percent of other miscellaneous property. For the first 6 months of 1948 police over the country recovered 21.5 percent of stolen property other than stolen cars. It appears from these figures that property recovered after dormitory thefts is well about national averages.

J. M. RORIMER,  
For FRED W. FORD, *Director,*  
*Office of Community Affairs.*

Mr. COOPER. Gentlemen, speaking of the Oxford Hotel, in the past 5 weeks we had on this area some 25 or 30 people engaged in nuclear energy work from visiting countries, scientists. I could give you several of their names. Those people were put in the Oxford Hotel. You will notice that when you gentlemen came in, you went to the Guest House. Go down to that hotel. Go into these dormitories. Stay these overnight. Stay there a couple of days, without the big shots here knowing you are here. [Applause.]

Gentlemen, those people were in that hotel. Dr. Sanchez was one, one of the best recognized scientists of Europe, and Dr. Wahle from New Zealand was another. Those people were there. I met with them several different times, and talked with them. They went to the dormitories. They are awful.

That is all I have to say. We are labor. We are opposed to this. We don't think these people are getting a just break. And if they get this thing put over on them, you people haven't had any howl at all to what you are going to get. [Applause.]

Representative DURHAM. Thank you very much.

Have the CIO Chemical Workers a witness here this morning?

(No response.)

Representative DURHAM. We have as our next witness Mr. Spitzer of the town council.

Will you come around, Mr. Spitzer? Will you have a seat and give your full name to the reporter?

**STATEMENT OF ED SPITZER, PHYSICIST, MEMBER OF THE TOWN COUNCIL, EAST VILLAGE, OAK RIDGE, TENN.**

Mr. SPITZER. My name is Ed Spitzer. I live in East Village, here in Oak Ridge. I am a physicist.

I would like to point out, before delivering this prepared statement, that the town council is the representative body of all the people in Oak Ridge, including the dormitory residents.

It is my privilege to appear before you as a delegate from the Oak Ridge Town Council, to present for your consideration the views of the only elected body representative of the citizens of this community. In view of the time limitations my presentation must be brief, but I hope that this general statement will lead you to appreciate in some measure the problems of a people living without voice in a federally controlled and dominated community.

Oak Ridge, gentlemen, is a city of contrasts. On the one hand, we have a typically American population gathered together from all of the 48 States of the Union and placed in one city to spend their lives and contribute their knowledge in the interest of the scientific development of atomic energy.

Most of these people uprooted their families from permanent communities of which they had been a part for many years, communities steeped in the democratic tradition of self-government so typically a part of our American heritage. Thus, unlike many other cities in this country, Oak Ridge is made up of people who have been associated with almost all of the States. In contrast, these same people now find themselves living in a city whose government is devoid of any semblance of democratic participation in decisions which vitally affect their everyday lives. The privilege of municipal administration here is exercised by a bureau of the Federal Government, a bureau that has evidenced no interest whatsoever in determining the wishes of the people or even permitting the citizens a voice in matters directly concerned with their own welfare.

There are many examples typical of the point I wish to make. I will cite a few of these as follows:

First. Not long ago the American Industrial Transit Co., an AEC contractor, requested an increase in the bus fares in Oak Ridge. In a normal community such a request would be heard before a utilities commission and supporting evidence presented and debated by all parties interested in the proposal. In Oak Ridge, the Atomic Energy Commission was prosecutor, judge, and jury. It granted a major increase in rate to the American Industrial Transit Co. and publicly announced its decision before the people who would foot the bill were even aware that an increase was being considered. The point in question here, gentlemen, was not the decision itself, which may or may

not have been justified, but the fact that it was reached in secret behind closed doors without a hearing being granted the citizens.

Second. Last summer AEC announced, without discussion, its decision to remove the area gates. This decision provoked much comment because many of the citizens felt that inadequate protective measures existed by virtue of the absence of local police and ordinance-making powers. Their opinions were never heard. AEC had reached a decision and it could not be altered. We all realized that the gates must come down and the city opened sometime in the future, but we had no opportunity to discuss the timing in relation to municipal incorporation in order that we could be assured of the security of our families and homes.

Third. Recently AEC announced a master plan for the city of Oak Ridge. This plan specifies residential and commercial zones, recreation areas, and, most important of all, the type of housing to be constructed. Again, the people who would rent the houses and live in the zones were not given an opportunity to express opinions. The result of this situation may yet prove to be embarrassing to the Government. At the present time, for example, hundreds of thousands of dollars are being spent on expensive garden-type apartments. New little square concrete block houses are being built along the railroad tracks in a low-lying area which is not the most desirable location in which to live. The people were not given an opportunity to express the opinion that single-unit homes were preferable to an expensive apartment, particularly where a great many acres of available land lie idle awaiting development.

Fourth. The last example I wish to cite, gentlemen, is the vague announcement that residential rental rates will be increased. No one knows the basis of the increase or how much it will be. Two thoughts occur to the citizens on this problem. The first is that in a normal community the landlord must justify his rent increases to the Rent Control Board on the basis of increased cost of maintenance, and at the same time a hearing is given the tenant. In Oak Ridge, AEC, through the Roane-Anderson Co., is both the landlord and the rent-control agency. It prepares its own case, holds its own secret hearing, and reaches a final decision to increase rent on the basis of the evidence it has presented to itself. The tenant is given no opportunity to question the evidence regarding costs or extravagances in maintenance, nor is he assured that valid comparisons have been used as a basis for establishing new rental rates. All he does is pay the bill.

The failure of the Atomic Energy Commission to permit citizen participation in these vital decisions before such decisions are made and announced is not a new criticism. It has been voiced many times, and we get the same stock answer from AEC to the effect that participation will be granted through town meetings and town council. The answer is good, but the action is lacking. Not only has AEC failed to keep faith on this score, it apparently has failed to delegate sufficient authority to any of its officials in Oak Ridge to enable them to keep faith. Our questions on vital community problems are passed on up the line to Washington and then are either forgotten or receive a vague and verbose reply that tells nothing. When a decision regarding the town is questioned by the people AEC adopts the atti-

tude that it must justify its actions regardless of the consequences, rather than submit to a critical examination of its decisions on the basis of their merits. To meet this end, its public relations experts fly into the breach and the citizens end up right back where they started—with a question that has no answer, and a bureaucratic decision that cannot be altered because of the apparent embarrassment that might be caused to the man who made it.

In closing, I wish to emphasize one additional point to the committee. It has been said many times that the people of this or any other community cannot expect the privilege of self-expression and a voice in the management of the affairs of their town without assuming the financial responsibility that goes hand in hand with such privileges. In this connection it is important to note that taxes are always a part of the rental rate established for a tenant to pay. There are no property owners here—the Atomic Energy Commission is the landlord, and as long as it owns the real estate it is directly obligated for taxes to support municipal government just as is any landlord in these United States. As a tenant we pay for the right to a voice in community decisions each time we pay our rent. A policy that would deny us that right would also deny the same democratic privilege to any other tenant elsewhere in America.

Oak Ridge is our home. We have broken the ties elsewhere and established ourselves here, and we are raising our children here. We have just as important a stake here as have the citizens of any other community. We resent the manner with which the Atomic Energy Commission deals with our futures and our pocketbooks without discussing these matters with us and without permitting any semblance of voice until after its decisions become an accomplished fact. We feel that we deserve to be treated as self-supporting citizens in a normal community, sufficiently interested and educated to express an adult viewpoint. Gentlemen, we like our town. We like it very much. But, having lived here 5 years or more since it was founded, we feel qualified to express hearty disapproval of the manner with which its affairs are managed.

Representative PRICE. Mr. Chairman, I want to congratulate Mr. Spitzer, who happens to be a fellow townsman of mine, on his fine statement. [Applause.]

I assure you that in leaving East St. Louis he has indeed made a terrific sacrifice. [Laughter.]

Representative DURHAM. Mr. Spitzer, your brief dealt, of course, with a great many more problems than we are concerned with here today. In a lot of them I concur in your viewpoint; because this matter of being entirely Government controlled has worried me considerably. We realize that we have a very serious problem on our hands, because an operation involving this year around \$700,000,000 is no little industry to operate.

Your brief was more or less directed at the over-all problem, and not so much at the dormitory problem, which we are concerned with primarily here today.

Mr. SPITZER. The dormitory problem is just another example of the whole thing, the way it works. The decisions are made, and we have no part in the discussion, and then the decisions are given to us as facts. We feel that we are adults and should be treated as adults.

**Representative DURHAM.** I certainly agree with you on that. Your problem of participating in your community life to me is one that is quite serious and one that should be of course fully explored; and, as far as I am concerned, personally, that right of participation should be extended to you.

**Representative HOLFIELD.** Before you leave, Mr. Spitzer, I would like to add that the operation of all of these atomic energy towns is, by the very nature of the work itself, different from ordinary towns. I do not think there is a Member of Congress, particularly of the Atomic Energy Committee, who does not share with you a desire to extend to the inhabitants of these towns every citizenship right which they would have in a normal town. We have not been able, maybe through lack of wisdom on our part, to evolve a satisfactory solution for the over-all situation. We feel that in encouraging the Atomic Energy Commission to remove the gates from the town, and to move toward self-government, we are moving toward what you are seeking.

We intend, of course, to encourage them, just as quickly as we can work out certain other problems which are not apparent on the surface, to do that very thing.

I might also say that the very fact that members of Congress are down here to hear these complaints, and that we come down here unprejudiced, and uninstructed, or unadvised, you might say, by the Commission, as to a solution of this problem, demonstrates that there is some concern on the part of the Congress as to the people's problems down here. We will certainly weigh the different pieces of evidence that have been brought before us this morning, and we will try to come to a conclusion that is right and just. Because, after all, we are representing the people of the United States and not the Atomic Energy Commission or Roane-Anderson, or any other particular group. We represent the people. [Applause.]

**Mr. SPITZER.** There is just one thing that we want. When these decisions are made that affect us so vitally, we want to know that they are being made. Just let us know the discussions are going on before the decision is reached and they say "Here it is." We would just like to know how they are arriving at these decisions. Probably they are all right. They have very intelligent men working on the problems. But we would like to be treated as adults, and find out just how they arrive at their conclusions.

**Representative PRICE.** Mr. Spitzer, as to the matter of the dormitories, was the town council consulted at any time prior to the action taken in curtailing the services?

**Mr. SPITZER.** No. And we were told if there were any rent increases in Oak Ridge, we would be notified before the rent increases went into effect. We were not notified of it at all.

**Representative DURHAM.** Thank you very much, Mr. Spitzer.

**Mr. SPITZER.** Thank you.

**Representative DURHAM.** I believe the next witnesses are Mr. Ford and Mr. Franklin.

Will you come forward, please?

I understand you will speak first, Mr. Ford.

Please give your names and your positions to the reporter, if you will.

**STATEMENTS OF J. C. FRANKLIN, MANAGER OF OAK RIDGE OPERATIONS OFFICE, ATOMIC ENERGY COMMISSION; AND FRED W. FORD, ACTING DIRECTOR OF COMMUNITY AFFAIRS, AND CITY MANAGER, OAK RIDGE, TENN.**

Mr. FORD. I am Fred W. Ford, acting director of community affairs, and city manager.

Representative DURHAM. You may proceed. Have you a brief there?

Mr. FRANKLIN. I don't, but Mr. Ford has. If I may, I would like to suggest that all of the details of the dormitory situation be discussed by Mr. Ford. I would also like to make one or two small comments as to the general over-all AEC policy as to rent.

Representative DURHAM. You may proceed.

Mr. FRANKLIN. It is our policy, as has been indicated, to make rents in Oak Ridge roughly comparable to those of the area in the neighborhood of Oak Ridge.

The rent which we are now charging in the dormitories and the rent which we propose to charge in the houses—and there is an increase under way, which will be announced April 28—is a rent which goes only part way toward area comparability. It does not go all the way. We believe it is necessary to take a step to achieve at least partial equality of rents with the area, even if we are unable at the moment to go all of the way to area equality.

I feel that as to our rents, as to whether they are comparable or not, we have had expert advice which indicates that the rents we are proposing to charge in the housing and are charging in the dormitories, as I have indicated, are not yet equal to area rents, but are higher than the existing rents and the previous rents.

We propose to take this, one step at a time, as is reasonable and practical.

If there are arguments as to the rents being comparable to area rents, I would welcome, as an individual, any independent analysis. I believe they are comparable, or have a half-way comparability, let us say. They are not wholly comparable, and they are on the low side of comparability.

That is the approach that we have in the matter of rents.

I would like to make a remark as to the reason we use comparability of rents rather than the cost of operations as a determinant of rents. We have had in Oak Ridge high operating costs. They still are not as low as they should be, in my opinion, nor as low as would be accomplished by a private operator.

In the past year and a half, however, tremendous advances have been made in the reduction of operating costs. As I have indicated, we don't believe they are as low as they should be yet, and therefore I don't believe it would be logical to base rents on costs.

There is another reason, too, why I don't feel that we should base rents on costs, and that is that in operation by the Government there is no agreement on the accounting involved in a determination of costs as to whether, for example, one ought to include an allowance for all the depreciation on the buildings, for the investment, and for taxes.

For these reasons we think the best approach is comparability of rents rather than operating costs.

I would like to mention also the matter of advice to the people of the decisions we in the AEC are about to make. I concur with the idea that we ought to consult the people in all matters of government. And we are making every effort to do this in the area of municipal government.

I believe one has to distinguish between the governmental function on the one hand, however, and all of the things which in the normal town are functions of individual operators; as, for example, the landlord, or the operator of the store, or of any of the commercial facilities.

I believe, again, that all municipal costs—municipal decisions—ought to be discussed, and that we should make every effort to have the participation of the people in all governmental matters.

I do not think that one is able to carry that as completely to operation of the landlord function or operation of the stores or other commercial facilities. This is not done in any other American town and it is not consistent with the American way of operation.

Representative HOLIFIELD. Let us pause right there a minute, Mr. Franklin. In an ordinary town, where the landlord-tenant relationship exists, whether it is the owner of one house or a large development of a thousand or 1,100 units, it is not customary for the landlord to call his tenants together and consult with them as to whether he raises their rent, is it?

Mr. FRANKLIN. No, sir.

Representative HOLIFIELD. Therefore, the point you are making is that while you have a community here that is similar to a regular town, at the same time, and because of the peculiar ownership factor here—of the Government owning this property—there is no comparable procedure in other towns, where the landlords consult with the tenants on the raise of their rents.

Mr. FRANKLIN. No.

Representative HOLIFIELD. They determine to a certain extent their operational costs; and, taking it outside of the area of rent control, which is a Government interference with private conduct of the operations, the ordinary American way of doing things, they go ahead and arbitrarily raise the rent either a just amount or an unjust amount without consultation with the tenant.

In the areas where rent control exists, they go before the rent-control board and present their arguments, show their increased costs of operation, and their lack of profit on the investment, and they are either given or denied an increase in rent by the rent-control authority.

Mr. FRANKLIN. That is right.

Representative HOLIFIELD. We cannot resort to either one of those methods here, so we have to take something in between. You have taken an in-between course, which is an attempt to find comparable quarters and gage the rent here by the comparable outside quarters.

Mr. FRANKLIN. I agree with that, sir.

Representative HOLIFIELD. All right. The basis of reaching this comparable or equitable procedure is under attack. It seems to me that Mr. Minor has made a pretty good statement in his attack on this sheet which has been furnished us. He has shown, in what he has presented here, that you are using for comparison here a room with cardboard partitions, poorly furnished, with inferior telephone facilities and inferior sanitary facilities, nonfireproof, and with many

other points of difference. So it seems to me that it puts a duty upon you and Mr. Ford to justify your comparability chart here. [Applause.]

Mr. FRANKLIN. We will be glad to do so.

Representative DURHAM. On that point: I think it would be valuable to this committee, both now and in the future, probably, though I do not know how much trouble it would be or how much expense it would involve, to have something on the cost of operation. I would like to have that. [Applause.]

Let us have a little order, here. We are trying to get along.

If it can be done without too much expense to the local authorities and to the Commission, it is something that I would like to have. I do not know how much detailed work there would be in the whole procedure. There would be quite a bit of it, I am quite sure. But we are going to be faced with this problem at other places as well as here, and I think instead of just basing it on one thing we should base it on other things also.

Mr. FRANKLIN. I would be glad to have all of the cost information supplied. And I think we could address some remarks now as to comparability. Mr. Ford could do so, if you would care to have him.

Representative DURHAM. I think we had better stay on comparability, as long as we started out on that, and as long as that is all it has been based on. But you people are going to increase your rents, according to your statement, or you are going to ask for an increase. If the Commission would prepare for this committee the costs of operation on this, as well as comparability, I think we would like to have that.

Mr. FRANKLIN. Is that on the dormitory and the housing, Mr. Chairman? You wish both costs?

Representative DURHAM. Both costs.

Mr. FRANKLIN. We will supply cost figures as to both.

(The information referred to will be found in the appendix at p. 70.)

Mr. MINOR. Mr. Chairman, we have three sets of cost figures in the figures that I submitted to you this morning, all issued by AEC. Would another set, that differs from those, be of any value?

Representative DURHAM. We can get those from the Commission, then, if you will supply those to the committee, and they will go in the record, if there is no objection.

All right, Mr. Ford, you may proceed with your statement.

Mr. FORD. Relative to comparability: Under the current rent schedule for dormitory space, the Atomic Energy Commission, the Roane-Anderson Co., and the James H. Moore Co. feel that the charges are reasonable and the services rendered sufficient for those prices. Comparability surveys have been made in this connection.

In March 1948, as part of the rental structure in Oak Ridge, the Roane-Anderson Co. was directed by the AEC to engage the services of a nationally known consultant appraisal firm to review all Oak Ridge living accommodations. The firm of Tredwell & Goldstein, of New York City, was engaged to make the survey, including recommendations to the Roane-Anderson Co. as to rental rates and service policies.

Representative PRICE. How was this company selected?

Mr. FORD. By securing from the real-estate board a list of competent firms, and, by the process of elimination, selecting Tredwell & Goldstein of New York City.

Representative PRICE. What was the process of elimination? How did you eliminate?

Mr. FORD. I think Mr. Worrel could give you more definite information on that than I could. It came before I arrived here, sir.

Representative DURHAM. Do you know the cost?

Representative PRICE. What did the survey cost?

Mr. FORD. Mr. Worrel?

Mr. WORREL (L. D. Worrel, assistant project manager, Roane-Anderson Co.). The survey cost \$25,000, sir. That includes the entire housing and rental comparison study.

Mr. FORD. Since there were no large groups of dormitories in the communities adjacent to Oak Ridge with which Tredwell & Goldstein could compare living accommodations, and recommend rental charges based on comparability, they made their study in the following manner:

They arrived at the room-rent value on Oak Ridge residential units other than dormitories by comparison of these units with units in the surrounding areas. They then drew a comparison between dormitory accommodations on the basis of livability to other residential units in Oak Ridge. They then recommended that the cost of providing maid and linen services in the occupied dormitory rooms and the cost of furnishings be added to the recommended rental charge, which ranged from \$15 for regular single rooms with no bath, to \$22 for special large double rooms with connecting baths. If these recommendations had been followed, the rental schedule would have ranged from \$23.35 for regular single rooms with no bath, to \$38.70 per person for special large double rooms with connecting baths.

Representative PRICE. Right there: Is this chart the result of the survey of this company?

Mr. FORD. That was supplemental information given to our Washington office.

Representative PRICE. Was this the result of the survey made by this company?

Mr. FORD. It was not, sir. This is supplemental information on the dormitories which were in this area, asked for by the central office—our central office.

Representative HOLIFIELD. Then you exercised your own judgment as to comparing the Oak Ridge dormitories with the Knoxville YMCA and the University of Tennessee.

Mr. FORD. We brought all those in, to have every dormitory there was in the area, whether better than ours, the same as ours, or poorer than ours. We wanted all figures in, for all dormitories in the area.

After careful consideration by both the company and the Commission, it was believed that it would be more acceptable to dormitory residents generally if some of the services were eliminated rather than to have a raise in the rates. This decision was based on the knowledge that a great many dormitory residents, due to personal considerations, would prefer changes in services to a substantial rate increase. It was planned that the dormitory operator would designate dormitories where more complete services would be provided if

a sufficient number of dormitory occupants indicated willingness to pay an additional charge for such services.

A dormitory survey also was made in the Washington, D. C. area [Laughter] where there are very similar buildings, built by the Government and operated by the Government, and known as Arlington Farms. They were built at about the same time and are very similar in nature and house governmental workers. They are similar in construction to the Oak Ridge dormitories. The main difference is that each building has additional wings providing 610 spaces, while the dormitories in Oak Ridge contain an average of 143 spaces. There also are other buildings on the site, such as cafeterias, recreation halls, infirmary, maintenance and so forth, which we have too.

Representative PRICE. Mr. Ford, are you going to quote the rates?

Mr. FORD. Yes. The room rental schedule follows:

Twenty double rooms, \$16.50 each occupant.

Two rooms, large, double, \$22.50 each occupant.

Three rooms, large, double, \$24.50 each occupant.

Five hundred thirty-six rooms, single, \$24.50 each occupant.

Twenty-one rooms, single, corner rooms, \$28.50 each occupant.

The services furnished:

Rooms are cleaned once a week on an established scheduled day.

Rooms are dusted, damp-mopped, and bed linens changed.

Two bath towels and two hand towels are provided weekly on an item-for-item basis.

Room floors are waxed only when the executive housekeeper thinks it necessary.

Cleaning equipment is available on each wing floor for use by the residents.

Each room is thoroughly cleaned twice a year, walls washed down, and so forth.

Two sheets, one pillow case, each week; and two blankets, cleaned once a year by the maids, are given, and a bedspread is provided.

Curtains and bedspreads are cleaned when required, by the maids.

The windows are cleaned by maids and housemen each spring only.

Laundry rooms are on each floor, and electric irons are available.

The office desk is open from 7 a. m. to 11 p. m., and mail service is provided 6 days a week.

Small kitchens are available for limited use. Dishes, utensils, and refrigerators are provided. Hours are limited, and kitchens are cleaned up by the residents themselves.

Representative HOLIFIELD. This is a résumé of Arlington Farms?

Mr. FORD. Yes, sir. I have copies of this here [handing]. The furnishings are not as good as they are here at Oak Ridge. There is a small closet space for each. The corridors have a carpet runner, which we do not have here.

(The information referred to will be found in the appendix at p. 70.)

Those were the figures available when the negotiations took place between Roane-Anderson and the James H. Moore Co., and which they had at hand last fall when this revision or modification of the Moore contract was being made. Subsequently, there were investigations made in each of the dormitories in this area. They excluded neither good ones, nor bad ones, endeavoring to give a picture of all the dormitories.

As specified before, the type I, University of Tennessee, is known as the Melrose Dormitory. That consists of three buildings, broken down into seven units, housing 358 men, as follows: One hundred sixty-four men in single rooms, 9 by 12 feet, at \$75 per quarter, or \$25 per month per person, and 194 double rooms, 12 by 13 feet, at the same rate per person.

The buildings contain 47 well-furnished living rooms, 200 square feet each.

Each unit has a built-in kitchenette in one of the living rooms for special use by students, and an elevator. Each unit has a large social room, 783 square feet in size, and there is one recreation room, 1,500 square feet in size, to serve the 3 buildings. There are 47 bathrooms throughout the 3 buildings, each having 2 showers, 2 toilet facilities, and 2 washbasins.

Representative HOLIFIELD. How many does that figure out per person?

Mr. FORD. Eight persons to one.

Representative HOLIFIELD. Eight persons to one?

Mr. FORD. Right.

Representative HOLIFIELD. How does that compare with your S and H type dormitories?

Mr. FORD. We have four units to each of the dormitories.

Representative HOLIFIELD. In other words, you have four showers?

Mr. FORD. No; there are four units, each, in turn, having four showers.

Representative HOLIFIELD. So it would be 16 to 143.

Mr. FORD. We have four shower rooms, each containing four shower stalls, with shower curtains in the women's dormitories, and there are four toilet rooms in each, containing four toilet facilities and four lavatories, and with mirrors over the lavatories. In each case, it is 4 times that, or 16.

Representative HOLIFIELD. About one shower to nine rooms. Would that be 144 persons?

Mr. FORD. It is about the same ratio.

Representative HOLIFIELD. About the same ratio?

Mr. FORD. Yes, sir.

Mr. MINOR. Mr. Chairman, why don't you ask him—

Representative HOLIFIELD. We have given Mr. Minor the courtesy of permitting him to take the witness stand and present his statement. He should give this witness a chance to continue.

Representative DURHAM. You may proceed, Mr. Ford.

Mr. FORD. Maid service is furnished daily, linens, towels, and blankets are not furnished. The clerk service consists of a resident manager and one clerk, assisted by faculty and students. One-way buzzer systems are installed in the rooms, with pay telephone booths in each unit.

Draperies and bare pillows are furnished.

Each room has a built-in desk for each occupant, a chest of drawers, bookshelves, single wood beds with innerspring mattresses, one lounge chair, a desk chair, a one-drawer nightstand, and closet space.

Each occupant has a post-office box in the mail distribution room.

The second type, the stadium type spoken of before, houses 690 men, three to a room, with rates of \$45 per quarter, for each occupant, or \$15

per month. There are four floors, and three large toilet rooms, each having six tile-partitioned showers, seven toilet facilities, and seven wash basins with mirrors and six urinals. It has one large recreational unit only. There are two large living rooms on each floor. The bedrooms are 12 by 17 feet and are furnished as follows:

One wood doubled-deck bed, one single bed, one nightstand, two desks, one combined desk and chest of drawers, two chests of drawers with mirrors, three desk chairs, and one lounge chair. There is no desk service or maid service. The students make up their own beds. The janitorial service is furnished.

There is a two-way buzzer system.

Occupants are required to furnish their own bed linens, blankets, towels, and accessories, including pillows. The buildings are steel and concrete, and about 1 year old.

The third dormitory type is a temporary structure about 2½ years old, a prefabricated wooden frame building, consisting of rooming quarters only. There is no lounge or recreation rooms.

The double rooms are 8 by 11 feet, and rent for \$35 per quarter, or approximately \$12 a room per occupant. Rooms are furnished as follows:

One double-deck Army type bed with a Regular Army mattress, two writing tables, two chests of drawers without mirrors, and two desk chairs. Occupants are required to furnish their own bed linens, blankets, towels, accessories, and pillows. No buzzer systems or telephone facilities are available. No desk service or maid service is furnished. The students make up their own beds, but janitorial service is furnished.

At Norris—and these things came from a visit to Norris, and from the operator who runs the Norris Dam dormitory—there is one wooden frame two-story dormitory with hardwood floors, consisting of 20 rooms, 10 by 10 each, available for occupancy.

The dormitory was built in 1933. Forced warm air heats the rooms. The room rates are \$7 weekly, or approximately \$30 per month, with one bathroom available on each floor.

Representative HOLIFIELD. May I stop you there, please?

According to this chart that we have on the Norris dormitory, \$20 is the basic monthly rent, and the rent control letter gives it as \$16.08. Now you are quoting a figure of \$30 to us, I believe.

Mr. FORD. That is the figure which the concessionnaire gave to the people who went over there.

Representative HOLIFIELD. Well, there is something wrong there.

Mr. FORD. Evidently, on those two facts.

Representative HOLIFIELD. There are three figures here. One is prepared on this chart that has been given us, of \$20. The rent-control letter gives \$16.08. Now you are giving us a figure of \$30. Are we talking about the same quarters?

Mr. FORD. TVA and Norris quarters.

Representative HOLIFIELD. Which the Rent Control Director said was the only comparable structure in the area.

Mr. FORD. A telephone call elicited the information that you have there, sir. This was obtained by a visit there to see the actual services. And those are the figures that were given within the last week, by the operator of that dormitory.

Representative HOLIFIELD. I believe you should furnish to our committee verification of these figures. There is evidently something wrong.

Mr. FORD. We will get a sworn statement from the individual concerned; because none of the three figures tie in, one with the other.

Representative HOLIFIELD. That is right.

Mr. FORD. The dormitory is leased from the Norris Properties, Incorporated, by a young couple who furnish all services from management to janitorial. The rooms are cleaned daily when in use; linens are changed once a week, and clean towels are furnished daily. No buzzer system is furnished, nor is telephone service available, except in the mail office. General custodial service on the premises is available, but no desk clerk is employed.

Representative HOLIFIELD. May I stop you there and ask you a question in regard to the mail service? I notice you mentioned it in this particular section, right before you read this one.

How do they handle their mail service there? Do they leave it in open boxes for the residents to get their own mail, or do they lock it up part of the day?

This seems to be a matter of some importance to these people, and it seems that small lockboxes could be provided or some method whereby they could get their mail at all times. Do you know how they handle that?

Mr. FORD. I am not positive of that, sir. I do not have that information. I will get it for the committee. In fact, I will get the whole restatement of that, and a signed statement, in view of the three conflicting figures which have come from them.

Representative HOLIFIELD. You are basing this statement on information you say you obtained over the telephone from the concessionaire?

Mr. FORD. These figures I am giving here were based on people from our organization going to Norris and discussing it with the couple who operate the dormitories.

Representative DURHAM. As soon as you get the sworn statement, Mr. Ford, send it to the committee; and, without objection, it will be incorporated in the hearings.

(The sworn statement referred to is as follows:)

#### STATEMENT

APRIL 21, 1949.

My name is Archie Yarbrough. I operate the Towne Inn in Norris, Tenn., under lease from Norris Properties, Inc.

The Inn contains five (5) rooms downstairs and nine (9) rooms upstairs available for rental.

The five (5) downstairs rooms are reserved for permanent residents and are rented for seven (\$7.00) dollars per week for single occupants or a total of approximately thirty (\$30.00) dollars per month. Services furnished for this rental are maid service daily, change of bed linens once weekly, and daily change of towels.

The nine (9) upstairs rooms are rented to transients at a daily rate of two (\$2.00) dollars single and three (\$3.00) dollars double. Services are the same as for the downstairs rooms except fresh linens are provided for new guests.

No mail deliveries are made to the Inn.

Telephone service is maintained through one pay station located on the lower floor.

No desk service is maintained. Regular residents carry their own keys. The registry for transients is maintained in my rooms adjacent to the downstairs entrance.

ARCHIE YARBROUGH.

Witness:

WILLIAM E. SWAIN, Jr.

Representative PRICE. Is there any postal regulation that prohibits you from placing it in these open boxes while there is not an attendant?

Mr. FORD. I believe there is, but Mr. Moore could answer that question, if he is here.

Is there any postal regulation which prohibits putting mail in an open box?

Mr. WORREL. The post office will not deliver mail to the dormitories without putting it in the custody of someone in the dormitories. That is the reason mail cannot be put in the open boxes.

Mr. FORD. At the Watauga Dam construction site, discussed before, which is a TVA project approximately 150 miles northeast of Oak Ridge, three men's dormitories are in operation, with 88 rooms each, 9 by 9 feet in size. The dormitories are portable type, demountable frame buildings, about 6 years old. These rooms rent for \$18.20 a month when occupied by a single person, and \$13 per person per month when occupied by two persons.

When two persons occupy the room, a double-decker bed is furnished.

The single rooms have one Army-type steel cot, one table, clothes closet, and one chair. The double rooms have one double-decker Army-type steel cot, one table, a double clothes closet, and two chairs.

General janitor service is available, with clean bed linen furnished weekly. No towels or soap are furnished. There is no desk or room-clerk service, no telephone service except in two buildings about a block away, and no buzzer system. Floors are bare.

Janitor service is furnished from 7 a. m. to 3:30 p. m. daily, and watchman service is furnished by three public-safety men on 8-hour shifts, who patrol an area which also includes the administration building and dam site proper. No mail is delivered to the dormitories from the post office about a block away.

There are similar quarters and services available at the South Holston dam site, nearby, at the same rates.

In Knoxville, the YMCA is a reinforced concrete building with brick walls and bare cement floors in the rooms. The building, constructed in 1930, has 113 rooms, of which 100 are single and 13 double. All rooms are 8 by 12 feet. The rates range from \$26 minimum to \$28.50 maximum for regular rooms, depending on the location, with a discount of approximately \$1.10 if rent is paid in advance.

These rates are applicable to only members of the YMCA. Transient rate is \$1.50 a day.

Recreation facilities, including gym and swimming pool, are available to all occupants. Rooms are furnished with a steel dresser, a bed, a desk, an easy chair, and a straight chair.

Desk clerk service is given 24 hours a day, maid service daily, exclusive of Sunday, and watchman service from 10 p. m. to 6 a. m. daily.

Representative HOLIFIELD. Where is this?

Mr. FORD. This is the YMCA in Knoxville.

Representative HOLIFIELD. Oh, yes.

Mr. FORD. A two-way buzzer system is provided, with a telephone on each floor. No soap is furnished, except to transients. Each floor has a common washroom, which contains six lavatories, three showers, three toilet seats and urinals. Each common washroom serves from 39 to 43 men.

Representative DURHAM. Mr. Ford, we are not going to be able to complete this before we recess for lunch, and I think this is a good place to stop.

We will adjourn the subcommittee and meet here at 2 o'clock, if that is acceptable.

(Whereupon, at 12:30 p. m., the hearing was recessed, to reconvene at 2 p. m. of the same day.)

#### AFTERNOON SESSION

(The committee reconvened at 2 p. m., following the expiration of the noon recess.)

Representative HOLIFIELD (presiding). The subcommittee will come to order, please.

Mr. Ford, will you take the chair?

Let the record show that Congressman Durham had to leave for Washington on an early plane, and therefore cannot be with us for the rest of the hearing.

You may proceed, Mr. Ford.

Mr. FORD. In regard to comparability, there is just a reiteration of one item which I would like to make at this time. That is that prior to negotiations, and in the whole rent structure here in Oak Ridge, here were two main premises:

First, comparability of living quarters in Oak Ridge, one with the other; and second, adjustment toward the outside area.

The negotiations were carried on premised upon the Tredwell-Goldstein report on comparability, and the Washington information was obtained in order that a comparison of services rendered could be given; and later, so that any dormitory outside of Oak Ridge but in this area could be analyzed as to whether it was better or worse than ours, additional figures were obtained. But the original concept and the present concept is based upon comparability of housing facilities in Oak Ridge, one with the other, and adjustment toward those in the rent-controlled area on the outside.

Representative HOLIFIELD. May I ask a question there, Mr. Ford? How is it possible for you to compare the dormitories here in Oak Ridge with the dormitory information which you have here in the chart as to the YMCA and the University of Tennessee, when they are totally different in construction, and probably the only similarity is space?

Mr. FORD. Space and services rendered. And, as I said before, those are the only dormitories of which we know in the area. So, as to how they bear on the Tredwell survey, they are brought into the picture so as to include for factual information every dormitory there is within the surrounding area of Oak Ridge.

Representative HOLIFIELD. But the purpose of this chart is not to show that the Oak Ridge dormitory single rooms at \$15 are necessarily comparable with the Knoxville YMCA single rooms at \$26.

Mr. FORD. No; nor that they are comparable with the rooms at the University of Tennessee type-I dormitory. The purpose of that is simply to provide full information.

Representative HOLIFIELD. For purposes of comparison, and not to show, for instance, that you are \$11 cheaper here than they are at the YMCA at Knoxville, and not to convey the idea that theirs are the same kind of accommodations, and yet you are \$11 cheaper.

Mr. FORD. No, sir. It is to give an entire picture of this area, and of every surrounding facility.

Representative HOLIFIELD. As a matter of fact, if you stick to straight comparability, you almost have to confine your comparison to the Norris TVA type and the Oak Ridge type. They are similar in construction and in furnishings, and in services; and also in price, if we take the \$16.08 figure.

Mr. FORD. Right; if you take dormitories only.

Representative HOLIFIELD. That is all we are considering in today's hearing.

Mr. FORD. But negotiations with the Roane-Anderson Co. were premised on a comparability survey made by Tredwell & Goldstein, which compared all living spaces in Oak Ridge, one with the other.

Representative HOLIFIELD. Of course, that question is not under consideration, as to the differences which obtain there.

Mr. FORD. The dormitories were a part of that survey of all living spaces in Oak Ridge.

Representative HOLIFIELD. But we have no complaint before the committee as to the relative merits of the rentals charged for houses and for the dormitories.

Mr. FORD. Yet your dormitory spaces will have to be in line with your residential facilities offered.

Representative HOLIFIELD. That is a matter of internal relationship within the city here.

Mr. FORD. That is correct.

Representative HOLIFIELD. But, as far as establishing your dormitory rates, you are not basing your dormitory rates on that interrelationship with them; are you?

Mr. FORD. The relationship within was considered by Tredwell & Goldstein, and also similar FHA housing in the area surrounding Oak Ridge. So, when you take your dormitory rooms here in Oak Ridge and compare them with your housing facilities in Oak Ridge, and then compare the over-all package with that which exists in the surrounding area, you can see that they do have a relationship one with the other. You can't do for the dormitory what you are not doing for the residential, and vice versa.

By the way, this morning it was stated that the contract with Tredwell & Goldstein was \$25,000. It was \$20,000. The original arrangement was to include additional survey work, but it came down to housing facilities, including dormitories, and that contract was \$20,000 and not \$25,000 as stated this morning.

But this was their opinion, their expert opinion, and the lists which they made up of each unit in Oak Ridge, including dormitory units, were based upon the relationship one with the other, and with the outside area. Because all people living in Oak Ridge should be paying rents that are comparable, one with the other. That is the main basis on which that survey was made, and on which they arrived at the prices quoted this morning as to the dormitories. That is, they did not care to bring in all these surrounding ones, which we later got, simply to develop the matter and show the entire picture. They

did not consider those in their comparability survey. It was living facilities within Oak Ridge, one with the other, and with the outside area.

There was also this morning a question brought up relative to the facilities mentioned in that letter; and I believe that the committee was handed this morning a copy of the information which has been publicized here in Oak Ridge and of which a copy did go to the Washington office. I believe that should be a part of the testimony, if it suits your purpose. That is the old agreement, and the new, the old services and new services.

Representative HOLIFIELD. Without objection, this will be made part of the record, Mr. Reporter.

(The report referred to is as follows:)

DETAILS OF SERVICES FURNISHED BY JAMES H. MOORE & Co., UNDER SUBCONTRACT EXPIRING FEBRUARY 28, 1949, AND UNDER THE NEW AGREEMENT EFFECTIVE MARCH 1, 1949

#### OLD AGREEMENT

1. Furnish daily maid service in rooms, such as cleaning rooms and making beds. Cleaning halls, showers, toilets, and lobbies. Changing linens each week, furnishing four hand towels and three bath towels for each occupant weekly.

2. Furnish 24-hour desk-clerk service at each dormitory except Covington Hall. The clerk was responsible for handing out mail, telegrams, and calling the occupants on the buzzer system 24 hours per day.

3. Laundering and/or dry cleaning draperies, rugs, mattress pads, bed spreads, blankets, and closet curtains for each occupant as required.

4. Waxing and buffing floors in halls and public spaces once every 2 weeks. Walking spaces in rooms every 2 months and the entire floor in rooms twice each year.

5. Washing windows and door glass on outside every 2 months.

Cutting grass during growing season every 2 weeks.

6. Maintenance responsibility: None.

Repair all doors and windows, replacement of hardware and fabrication of keys; do all minor maintenance on doors, screens, furniture. Repair electric buzzer, lamp cords, and replace light bulbs and fuses.

#### NEW AGREEMENT

Furnish daily maid service such as cleaning showers, toilets, halls, and lobbies. Changing linens once each week, cleaning rooms once each week at the time the linen is changed. Furnishing two hand towels and two bath towels for each occupant weekly.

Furnish desk-clerk service at each dormitory between the hours of 4 p. m. and 10 p. m. daily except Sunday. The clerk is to be a resident clerk and supervise the housekeeping during certain hours in the morning and afternoons except Sunday.

Furnish matron service in each women's dormitory from 10 p. m. until 6 a. m. daily.

Furnish watchman service every hour in men's dormitories between the hours of 11 p. m. and 7 a. m. daily.

Laundering and/or dry cleaning draperies, rugs, mattress pads, bed spreads, blankets, and closet curtains for each occupant once per year. The above items are to be furnished clean for each new occupant.

Waxing and buffing floors in halls and public spaces once each month, walking spaces in rooms every 6 months and the entire floor in rooms once each year.

Washing windows and door glass on outside every 4 months.

Cutting grass as required.

Repair and replace faucets, water valves on individual fixtures. Repair registers to the heating system.

Not required to repair furniture but the furniture must be in acceptable condition when the contract is terminated or when the furniture is returned to the agent.

Mr. FORD. As to the reference made to daily linen service, that is incorrect. There was daily making of beds, except Sundays, and the furnishing of linens on one day each week. Towels were furnished once each week, four bath towels and three hand towels, as against two bath towels and two hand towels now being furnished to the residents of the dormitories.

There was also a listing of all the dormitories, their spaces, and their rates, which, if it suits the committee, I should also like to offer. That gives the name of each dormitory, its type, the number of single rooms, their rates, the number of double rooms, their rates, and the total spaces, showing the total of 1,971 spaces available in dormitories.

Then, at the foot of the chart, there is a summarization of the types of rooms, showing the number of single rooms at \$15 per month, the large single rooms in Bayonne Hall at \$20 per month, the large single rooms in Cambridge at \$20 per month, the double rooms at \$10 per space per month, the 28 rooms with connecting baths in Covington Hall at \$25 per month, the 34 double rooms with connecting baths in Bayonne Hall, at \$25 for a single occupant or \$15 for a double occupant, the 34 double rooms with connecting baths in Cambridge Hall at \$25 per month for a single occupant or \$15 for each double occupant, and the 34 double rooms with connecting baths in Cambridge Hall presently rented for \$25 by single occupants.

Representative HOLIFIELD. We will receive that for the record. (The chart referred to is as follows:)

*Break-down of type and number of spaces in active men's and women's dormitories, Apr. 16, 1949*

Dormitory	Type	Single rooms	Double rooms	Total spaces
Batavia.....	H-W	65 at \$15.....	38 at \$20.....	141

			34 at \$25.....	68

NOTE.—H-W denotes women's H-type; S-W denotes women's S-type; H-M denotes men's H-type; S-M denotes men's S-type.

#### SUMMARY

1. Seven hundred and sixty-seven single rooms at \$15 per room per month.
2. Forty-six large single rooms in Bayonne Hall at \$20 per month.
3. Forty-eight large single rooms in Cambridge Hall at \$20 per month.
4. Four hundred and seventy-three double rooms at \$10 per space per month, or for \$20 per room for single occupants.
5. Twenty-eight rooms with connecting baths in Covington Hall at \$25 per month.
6. Thirty-four double rooms with connecting baths in Bayonne Hall at \$25 per month per single occupant, or \$15 each double occupant per month.

7. Thirty-four double rooms with connecting baths in Cambridge Hall at \$25 per single occupant per month, or \$15 each double occupant per month.

NOTE.—The 34 rooms with connecting baths in Bayonne and Cambridge Halls are all used by single occupants.

Representative HOLIFIELD. At that point, may I ask you what your percentage of vacancy is now in your dormitories?

Mr. FORD. Mr. Moore could probably give that, or Mr. Worrel.

Mr. WORREL. There are slightly over 1,900 spaces available in the active dormitories, and about 1,811 of those spaces are occupied. That does not mean that there are 1,811 individuals in the dormitories, because some individuals rent two spaces.

Representative HOLIFIELD. But there is a vacancy of over a hundred?

Mr. WORREL. That is right, scattered through the 15 dormitories.

Representative HOLIFIELD. So if additional people wished to live in this area, in these dormitories, there are spaces available.

Mr. WORREL. That is correct.

Representative HOLIFIELD. You may proceed, Mr. Ford.

Mr. FORD. There is also an exhibit here which gives the furniture in each of the single rooms of the dormitories, in the double rooms, in the special dormitories, Bayonne and Cambridge Halls, in that smaller dormitory, Covington Hall; and this also shows the lobby and recreation rooms in each dormitory, the bathrooms in each dormitory, the toilets in each dormitory, the laundry facilities and kitchen facilities which are offered in the women's dormitories. Those are all enumerated in this document.

Representative HOLIFIELD. It will be made part of the record.

(The material referred to is as follows:)

APRIL 18, 1949.

#### DESCRIPTION OF DORMITORY ROOMS IN THE DORMITORIES OPERATED BY JAMES H. MOORE & Co.

##### SINGLE ROOMS IN THE H- AND S-TYPE DORMITORIES

The rooms are approximately 9 by 11 feet in size. Each room is equipped with a clothes closet with drapes. Rate per month \$15.

The furniture and furnishings are as follows: 1 Hollywood-type bed, single; 1 mirror; 1 chest of drawers; 1 desk; 1 floor or table lamp; 1 ceiling light; 1 chair with arms; 1 chair without arms; 1 waste basket; in some cases a throw rug, but this is not always furnished.

##### DOUBLE ROOMS IN THE H- AND S-TYPE DORMITORIES

The room is approximately 11 by 13½ feet and has a clothes closet with drapes for each occupant. Rate per month for each occupant \$10.

The furniture and furnishings are as follows: 2 Hollywood beds, single; 2 mirrors; 2 chests of drawers; 1 desk; 1 ceiling light; 1 floor or table lamp (in some cases two); 1 chair without arms; 2 chairs with arms; 1 waste basket; in some cases two throw rugs, but this is not standard.

##### BAYONNE AND CAMBRIDGE HALLS

There are 34 rooms approximately 10½ by 11 feet with connecting baths in each dormitory. These are single rooms and rent for \$25 per month.

Each dormitory has one room approximately 14 by 16 feet and one room approximately 12 by 16 feet. These rooms have connecting baths and rent for \$25 per month.

Cambridge Hall has 48 single rooms approximately 10½ by 11 feet that rent for \$20 per month.

Bayonne Hall has 46 single rooms approximately 10½ by 11 feet that rent for \$20 per month.

## COVINGTON HALL

This dormitory was originally constructed for nurses and was operated by the Oak Ridge Hospital until October 1, 1948.

Due to the excessive cost incurred in this operation, the Oak Ridge Hospital requested that Roane-Anderson Co. assume the responsibility for the operation of the dormitory.

Negotiations were completed with James H. Moore & Co. to operate Covington Hall effective October 1, 1948.

The services furnished by the subcontractor were the same as in all other dormitories with the exception of desk clerk services.

The desk clerk at Columbia Hall looked after the services in Covington, such as delivering mail, telegrams, and collecting of rent.

Roane-Anderson Co., made no subsidy payment to James H. Moore & Co. for the operation of Covington under the old agreement, and under the new agreement James H. Moore & Co. pays the agent \$100 per month for Covington Hall.

Under the new agreement there is no resident clerk or matron in Covington Hall; this service is furnished by the resident clerk and matron at Columbia Hall.

Covington Hall has 28 single rooms approximately 10½ by 11 feet with connecting baths that rent for \$25 per month.

## LOBBY AND RECREATION ROOMS

Each dormitory with the exception of Covington Hall has a lobby on the first floor and a reading or recreation room on the second floor. The downstairs lobby in each type of dormitory is approximately 16 by 18 feet. The S-type may be larger.

They have a 9-by-12- or 12-by-15-foot rug on the floor, chairs and settees equivalent to three settees, a large table, three floor lamps, one to three small tables, ash trays and in some cases extra pieces of furniture.

The upstairs recreation room is much larger and has quite a few chairs and a large table. Several floor lamps are in each room.

## BATHROOMS

In the semiprivate bath or connecting bathrooms, approximately 5 by 7 feet, there is a shower stall with a curtain, a toilet and lavatory, and a stool. There are four public bathrooms, one in each wing on each floor in the regular dormitories.

Each bathroom has four showers, coat hooks on the walls for hanging clothes, a bench, and the ladies' showers have curtains; the men's do not.

## TOILETS

There are public toilet rooms adjoining the bathrooms in each regular dormitory. Each room has four toilets, four lavatories, with mirrors and lights over each lavatory. There is a door to each toilet stall.

## LAUNDRY FACILITIES

Each of the 15 dormitories being utilized has a Bendix washing machine on which a 10-cent charge is made. These machines are furnished and serviced by a concessionaire.

## KITCHEN FACILITIES

In seven of the women's dormitories, kitchens for cooking purposes are provided. These kitchens are 16 by 30 feet each, and are furnished as follows:

- 36 food compartments, 16 by 24 inches with locks.
- 24 linear feet of linoleum-covered counter top, 2 feet wide.
- 18 linear feet metal-covered counter top, 2 feet wide, having places for six hot-plate receptacles.
- 3 kitchen sinks mounted in linoleum top drainboard.
- 3 tables.
- 12 chairs.
- 10 lights.

This service comes with the rent.

Two of the kitchens in women's dormitories have refrigerators.

NOTE.—When a single occupant rents a double room and pays the applicable rental rate, the occupant may request the entire furniture for the double room remain in the room, or he may request a subcontractor to remove part of the furniture.

The subcontractor will comply with the request in either case.

If the double room remains intact, and the occupant desires the linen for the double room, it is furnished.

If the occupant requests the extra furniture be removed, the occupant receives only the linen service for a single occupant.

The extra furniture is stored in a storeroom in the dormitory by the subcontractor.

Mr. FORD. I might also say that Rutherford Hall is not a dormitory, is not listed under these dormitories, and is under a separate concession, as a hotel; and the rates of \$50, for example, are for two persons, not one person.

Representative PRICE. Do they rent to one person at \$50?

Mr. FORD. Two persons are in that particular room which was spoken of this morning, a man and his wife.

I would also like to touch upon the "class distinction," as I believe it was referred to this morning, in the giving of spaces to persons here at Oak Ridge.

All spaces save dormitory spaces are allocated, there being a shortage of housing. That allocation is premised, first, on the importance of the employing group to the operation, the program of the AEC; and then assignments of housing under those allocations to the major employing groups are premised on the importance of the individual to their particular operation. Naturally, under that, Carbide & Carbon Corp. does receive a larger share, because they are performing the primary work for which Oak Ridge was instituted.

Representative HOLIFIELD. There is no discrimination practiced because of salary level?

Mr. FORD. The only thing which comes in relative to salary level would be, of course, the importance of the individual to the particular operation, whether it be Carbide or whether it be AEC, or whether it be Roane-Anderson or any other employing group within the area. The determination as to the more responsible positions is based entirely upon the opinion of the employing group, and it not made by AEC.

The salaries that were discussed this morning were premised upon a survey made by our personnel department some time ago, some 2 to 3 months ago, which in our opinion fairly substantiates what the pay levels are here in Oak Ridge. There may well be less of the so-called key employees in the dormitories than in the housing. But \$3,100 is the best estimate we have, because we do not have the pay rolls of many of the employing groups. That is, in the dormitories are the concessions, for which we do not have pay rolls. There are some contractors who are building within the area, who may have people within those groups housed in the dormitories. And there we do not have any pay rolls to guide us.

We do have access to some and the average has come from those which we have, which would be our main contractors, Carbide, Roane-Anderson, AEC, and such as that.

Representative PRICE. Mr. Ford, what were the factors involved in curtailing the services to the dormitory?

Mr. FORD. As stated this morning in connection with the Tredwell survey, the rates would have gone to \$23.50 per space as against \$15 currently paid. On discussion and after some contact with a few of the residents, it was determined that a decrease of service would be preferable to an increase in rent. The whole thing was premised on that, sir.

Representative HOLIFIELD. Do you mean by that that your decrease in services in these dormitories is the only adjustment you intend to make?

Mr. FORD. Yes, sir.

Representative HOLIFIELD. You do not intend to raise the price of the dormitory rooms?

Mr. FORD. No, sir.

Representative HOLIFIELD. It is just the decrease in the services. Now, how much do you save by decreasing these services?

Mr. FORD. About \$129,000 per year.

Representative HOLIFIELD. \$129,000 for all the dormitories?

Mr. FORD. That is correct, sir.

Representative HOLIFIELD. How many dormitories are there?

Mr. FORD. There are 14 large dormitories, and Covington Hall, the small dormitory. Those figures are shown in here; the same figures which were given to our Washington office, which, in turn, were given to your committee.

Representative HOLIFIELD. What does that average, per space? Do you have that broken down?

Mr. FORD. Savings per space?

Representative HOLIFIELD. Yes.

Mr. FORD. No. But roughly it would be dividing that by 2,000, which would be 65.

Representative PRICE. I believe some mention was made that for an additional \$7.50 per month—

Mr. FORD. That was \$6, sir. The other was an off-the-cuff remark made as to what those services would cost. I think the first statement was \$8, and then \$7.50. Later the figures were analyzed, and it was given out as \$6.

Representative PRICE. You referred to a forthcoming increase in housing rentals. Will the dormitories be included in that increase?

Mr. FORD. We had anticipated that the dormitory increase and the housing increase would be at the same time. We second-guessed the matter of when the increasing in housing rentals would come.

Representative PRICE. In other words, your dormitory status will remain the same.

Mr. FORD. The same as it is today; yes, sir.

Representative HOLIFIELD. As it is under the proposed decrease in services.

Mr. FORD. Under the decrease in services that has existed since March 1.

Representative HOLIFIELD. And that does exist at the present time.

Mr. FORD. Right, sir.

Representative HOLIFIELD. I notice that on the chart it says "proposed changes." But that change has been made.

Mr. FORD. The change has been made. It was made on March 1. A contract was entered into by the Roane-Anderson Co. and approved by the AEC.

Representative PRICE. What protection do you have in connection with fire hazard during a time when you do not have a clerk in charge?

Mr. FORD. In the women's dormitories there is a desk clerk there from 4 p. m., to 10 p. m., and a matron who is there from 10 p. m. to 6 a. m. The one who is in charge of the help in the dormitories lives there but is not on duty, except in the morning period putting the maids to work, and overseeing the work to see that it is performed correctly.

Representative PRICE. Is any responsible person on duty between 10 in the morning and 4 in the afternoon?

Mr. FORD. There is no one except the person who lives in the dormitory. But he or she could be out.

Representative PRICE. Have you given any thought to correcting the inconvenience in the matter of mail by possibly placing some boxes in there that could receive mail within the regulations of the Post Office Department?

Mr. FORD. We do not have the price of that, but there could be lock-boxes. That is done in some cases. And I believe the Post Office would put the mail in the lockboxes.

Representative HOLIFIELD. So that each individual could have a key to his box.

Mr. FORD. Their own keys to their own boxes. That would be the way in which the mail could be delivered. I can see no reason why the mail people would not deliver on that basis.

Representative HOLIFIELD. This seems to be a small adjustment that would not take a great deal of expense. I think the committee's judgment would be that it would be worthy of exploration on the part of the people in charge of your dormitories, to see if it can be effectuated without too much additional expense.

Mr. FORD. We will be glad to explore that.

There has been some discussion relative to different sets of figures.

Representative PRICE. Three sets of figures have been mentioned here. Could you tell us something about them?

Mr. FORD. The original computations made last fall were premised upon the operation of 18.6 dormitories, which were in existence at that time. Also it was made on the basis of there being desk service only between 4 p. m. and 9 p. m. The savings under those conditions would have been \$166,000 per year. I believe you gentlemen had that figure, and it was also published in the local press.

The population of the dormitories has been falling off continuously over a period of years, and dormitories have been put out of commission when the population got to the point where vacancies in other dormitories could take care of the people, allowing one dormitory to be closed.

At the present time, with 14 and a fraction dormitories—we consider Covington Hall a fraction—and then including the restoration, or the establishing of matron service between 10 a. m. and 6 p. m., naturally new figures come up. Our costs would not be as great. Neither would the amount of return be as great.

So that the figures which are reproduced in this statement, of which your secretary has a copy, are premised upon the present operations of the 14 large dormitories, and Covington Hall, based upon the matron service now being given. And we believe that those will be the figures which very closely will obtain.

Representative HOLIFIELD. From the best figures you have on the operation of these dormitories, can you tell the committee that you have been operating them at a loss?

Mr. FORD. The dormitories have been operated at a considerable loss.

Representative HOLIFIELD. How much of a loss per year has occurred?

Mr. FORD. It has come down with the decrease in the number of dormitories. It approached \$500,000 in 1948. The original 1949 budget, premised upon the dormitories shown in the exhibit when that budget was made, a year previously—

Representative HOLIFIELD. Which was how many?

Mr. FORD. At that time it was 22, I believe, when the 1949 budget was made. When we started the operation of the 1949 budget, it was 18 and a fraction. Eighteen and a half dormitories were in operation as of July 1, instead of the number which we anticipated the year before.

Representative HOLIFIELD. What did you anticipate that your operational loss would be?

Mr. FORD. For 1949?

Representative HOLIFIELD. For 1949.

Mr. FORD. \$460,000.

Representative HOLIFIELD. And that represented how many dormitories in operation?

Mr. FORD. I would want to verify that with the budget, which I do not have with me, but it was either 21 or 22 dormitories.

Also, sir, in the dormitory costs, there are four dormitories which are held for security purposes, ready for immediate use; and we have certain idle dormitories, on which watchman service is required, and a sufficient amount of maintenance service on the exterior must be performed to keep them in condition. Those also come as a part of the over-all cost of the dormitories.

Representative HOLIFIELD. That shows about \$21,000 loss per dormitory, in round numbers, if I have it figured right. Dividing 22 into \$460,000, gives you about \$21,000 per dormitory loss. Figuring 143 spaces to the dormitory, according to my figures, you show a loss in round numbers of \$146 per space.

Mr. FORD. You are computing how many dormitories?

Representative HOLIFIELD. That is arriving at your loss by dividing \$22,000 into \$460,000. That gives you approximately \$21,000 per dormitory. Then, dividing 143 spaces into that, which I understand is the average, you arrive at approximately \$147 per space. Then, when you reduce that to months, it comes to slightly more than \$12 a month loss per space in the dormitories.

Mr. FORD. If you do not consider utilities, depreciation, or any of those factors.

Representative HOLIFIELD. And your loss figure of \$460,000 did not include utilities?

Mr. FORD. Our utilities cost us on the average \$108,800 per year for the dormitories.

Representative HOLIFIELD. Have you reduced that to spaces or rooms?

Mr. FORD. No; I have not, sir.

Representative HOLIFIELD. Let us reduce that. Let us find out how you are operating here. The \$108,000 covers roughly 3,000 spaces. That is \$36 per space. So you add that to your \$147; and you are operating these dormitories at a loss of \$183 per space per year, in round figures. Is that right?

Mr. FORD. Right. That is on what we actually pay out, and not including any depreciation.

Representative HOLIFIELD. Does it include maintenance?

Mr. FORD. It includes maintenance; yes, sir.

Representative HOLIFIELD. It includes your janitor service and all operational costs?

Mr. FORD. All operational costs.

Representative HOLIFIELD. But it does not include depreciation or repairs?

Mr. FORD. It includes repairs; yes, sir.

Representative HOLIFIELD. It includes repairs, but not depreciation.

Mr. FORD. Yes, sir.

Representative HOLIFIELD. I think it is well for the people to know what the situation is here, because some of them may think you are making a lot of money on this at \$15 a space. [Laughter.]

Mr. FORD. As for the maintenance, on the original budget, sir, during the past 2 years, there has been more maintenance done than previously; because just following the war, for a 2-year period, we were very much behind in our maintenance, and the maintenance has been high. The maintenance this year will not be as large as budgeted for—(1) because there aren't as many dormitories in operation and (2) because we got further last year than had originally been anticipated. So there would have been a decrease on that basis along between the number of dormitories and the maintenance which had been done prior to July 1, of \$100,000, in our budget.

Representative PRICE. How does the subcontractor fit into that picture?

Representative HOLIFIELD. Before you take that up, I just want to make one statement.

According to your figures, here, you are getting \$15 per space in these dormitories, and in addition it is costing you \$15 more than the \$15. So according to my figures, it is costing \$30 per space for these dormitories, of which the occupant pays \$15 and the Government pays the other \$15.

Mr. FORD. That is correct.

Representative HOLIFIELD. The next thing that I want to inquire into is the subject which Mr. Price has brought up, and that is an analysis of your operational costs.

Do you wish to pursue that?

Representative PRICE. No. Go ahead. You are on that thought now.

Representative HOLIFIELD. How much of your operational costs are represented by supervisory salaries? Can that be isolated?

Mr. FORD. The amount paid out under the contract between Roane-Anderson and the James H. Moore Co.? The history of that is included in this statement here. Under the old contract we paid the Moore Co. a stated amount for each dormitory operated. Under the new contract the Moore Co. pays us for each dormitory operated, and

also performs the interior ordinary maintenance which used to be performed by Roane-Anderson.

As for the break-down of the costs, for example, let us take the first 9 months of this year. This is broken down into the same figures as were in the original budget, although the accounting set-up as of today divides them in a different manner. They were put in relation to this so as to be comparable exactly to the budget, as was requested.

In the administration of the dormitories, the Roane-Anderson Co., our agent, performs all of the extraordinary maintenance, structural repairs to the buildings, replacement of worn-out equipment or parts of the buildings, and administration of the Moore contract. Under those various headings, Roane-Anderson's costs for the 7 months from July 1 through January 1949 were \$20,737.

Representative HOLIFIELD. How many months was that?

Mr. FORD. That was the 7 months from July through January. That same figure for February was \$2,081, and for March \$3,050. The supplies and materials provided to the dormitories for the first 7 months were \$4,807.

Representative HOLIFIELD. Is that in addition to the supervisory costs? You are bringing in some other items now; are you not?

Mr. FORD. Right, sir.

Representative HOLIFIELD. Did the \$20,737, the \$2,081, and the \$3,050 include any materials or repairs, or was that strictly supervisory?

Mr. FORD. That was strictly supervisory, and a proration of the Roane-Anderson overhead for the entire operation.

Representative HOLIFIELD. Out of that amount has the Roane-Anderson Co. paid the salaries of the bookkeepers and others who take care of these dormitories, the bookkeepers and workmen? Or is this a net operational management fee?

Mr. FORD. This has nothing to do with Moore's direct operation within the dormitories.

Representative HOLIFIELD. I see. Then this is a supervisory managerial fee.

Mr. FORD. It is a proration to the dormitories of the Roane-Anderson overhead. Let us call it that. That is the entire office, from the project manager, Mr. McNeill, down through his comptrollers, accounting personnel and right straight down through their organization. The net overhead is prorated to every operation on the area under the Roane-Anderson direction. And this is the proration of that amount to the dormitory. As for direct expense in that, Roane-Anderson has a full-time person who inspects four dormitories each day. That rotates, going right straight through the dormitories, and starting over again, to make sure that the housekeeping function, repairs, and such, is being performed, and to report back on other things that are necessary.

Representative PRICE. I thought that was the responsibility of the subcontractor, Moore.

Mr. FORD. To do those things; yes. This is a check of Moore's performance by Roane-Anderson.

Representative HOLIFIELD. As I figure that, Mr. Ford, that is at the rate of \$3,221 per month average. I am using your \$20,737, your \$2,081, and your \$3,050 and dividing eight months into that. That is about \$3,200 a month.

Now, would you say—and I am asking strictly for information—that that is a fair operational expense, a fair supervisory expense? Would you say that the amount is a fair amount?

Mr. FORD. I do think so. It is a percentage of the entire operation, the cost of the entire operation. That is how you would gage it in normal contracting computations.

Representative HOLIFIELD. I think it is well to bring these figures out, so that the people will know exactly what it is costing.

Without going into it, it would seem to me that that would be a fair supervisory charge; without checking it against other like operations.

In relation to the rent charged, of \$15, if, as appears to be the case, only a very small fraction is going to managerial expense, it is evident that you cannot recoup this loss that the Government is incurring, out of the managerial fee.

Mr. FORD. You can't.

Representative HOLIFIELD. Even if you took it all.

Mr. FORD. Even if we took it all, right.

Representative HOLIFIELD. So the picture, as I see it, from these figures—and I intend to have it checked thoroughly later—is that each one of these spaces is costing the Government \$30 per month. They are in turn renting to the individual at \$15 a month. Therefore, the Government is sustaining a loss of \$15 on each space.

Mr. FORD. Would you care to have the rest of the break-down now?

Representative HOLIFIELD. What additional information do you have, may I ask?

Mr. FORD. There is the supplies and materials that I spoke of, \$4,800 during the first 7 months, and \$1,600 during February and March.

On maintenance our total for the first 7 months was, in round figures, \$82,600. In February it amounted to \$5,400. In March it amounted to \$2,200 in round figures.

Representative HOLIFIELD. Now I would like to question you on the contract by which the Moore Co. renders the actual service. As I understand it, the Moore Co. renders the actual service in the dormitories.

Mr. FORD. Correct, sir.

Representative HOLIFIELD. On a subcontract with Roane-Anderson.

Mr. FORD. Yes, sir.

Representative HOLIFIELD. The fee that has been mentioned is merely a supervising, auditing, checking, and proportional overhead fee for Roane-Anderson. Now, what is the fee paid the Moore Co. for taking care of these dormitories?

Mr. FORD. The Moore Co., under the previous bid—and I think I would have to go back here a little bit into the back history on the old contract.

Representative HOLIFIELD. Why do you go back?

Mr. FORD. To show what was, and what is, in the Moore contract, what changes have been made as of March 1 of this year.

Representative HOLIFIELD. I see.

Mr. FORD. In the contract, which expired at the end of February of this year, and through bid, they being 1 of 10 bidders, and being awarded the contract as for the best interests of the Government, the Government paid to the Moore Co. varying amounts for each dormitory operated by them.

Representative HOLIFIELD. On the basis of cost plus a fixed fee? Or on the basis of a negotiated total sum?

Mr. FORD. The specifications for operating the contracts were gotten out as to what the operation included. Those specifications were given out to 40 interested persons. Out of those, 10 submitted bids for the operation of the dormitories. Out of those 10 bids submitted, the Moore Co. submitted a bid by which the Government paid less to the operating company for operating the dormitories than any other bidder.

Entering into that were various amounts ranging from a hundred-odd dollars to nearly \$500 per dormitory, what the Government gave to the Moore Co, for the operation. The Moore Co. in turn collected the rentals, took any loss there was in the rentals, paid insurance, and provided the services. Their operation was with the rents collected and the amount received from the Federal Government.

Representative HOLIFIELD. They used the rents as far as they would go?

Mr. FORD. As far as they would go.

Representative HOLIFIELD. And then they were subsidized this \$15 per space loss by the Federal Government?

Mr. FORD. They were subsidized by the bid amount, not this amount here. Because Roane-Anderson Co. still performed those services under the old contract, except the minor maintenance.

Under the new contract, the Moore Co. pays for each of the men's dormitories operated \$300 per month to Roane-Anderson, and therefore to the Federal Government. They pay \$122.50 per month for each women's dormitory operated, with the exception of Covington Hall, that small one, for which they pay the Government \$100 per month. So that your net difference is between what they are now paying to the Government and what the Government previously paid them. That varies from \$100 to over \$800 a dormitory. And that is a major portion of the savings which were indicated previously. The balance of those savings was in the maintenance taken over by the Moore Co., minor maintenance taken over by the Moore Co.; and with a smaller contract, the proration of Roane-Anderson becomes smaller, so that your proration of the overhead of Roane-Anderson is about \$3,700 less under that arrangement than the old arrangement.

Representative HOLIFIELD. Does that decrease as you close each dormitory? It is on a sliding scale?

Mr. FORD. For example, if any one of these dormitories is closed, there will be no more payment made for that dormitory; and in turn neither Roane-Anderson nor anyone else will make any payment except to keep that dormitory exterior in shape, to prevent deterioration.

Representative HOLIFIELD. This proposed decrease in services you say will save \$128,000 to the Government. Whom does that benefit? Does that benefit Roane-Anderson, the Moore Co., or the Federal Government?

Mr. FORD. The Federal Government, sir. Every penny of saving goes to the Federal Government.

Representative HOLIFIELD. None of this saving is absorbed in additional profits by any one of the concessionnaires?

Mr. FORD. No, sir.

Representative PRICE. Did I understand you to say that the Moore Co. pays through the Federal Government about \$100 per dormitory for the privilege of operating the dormitory?

Mr. FORD. Three hundred dollars for the men's dormitories.

Representative PRICE. They pay that to the Government?

Mr. FORD. They pay it through Roane-Anderson Co. to the Government, correct.

Representative PRICE. Will you briefly explain to me how the Moore Co. makes its money, its profit?

Mr. FORD. The Moore Co. must, within the rents collected, less this amount per month for each dormitory, hire their staff, perform their maintenance services, and give the dormitories the services that are given. It must come out of that.

Representative PRICE. And how have they been coming out on that?

Mr. FORD. I don't know the exact figures, sir.

Representative PRICE. Can we get those figures?

Mr. FORD. On that incentive-type contract, we have not in the past; no, sir. That would have to come directly from the dormitory operator.

Representative PRICE. They are certainly operating with the idea of making a profit.

Mr. FORD. I certainly would.

Representative PRICE. I think that is a very important thing.

Representative HOLIFIELD. It is important, but the fact remains that they were awarded this contract in competitive bidding.

Mr. FORD. They were.

Representative HOLIFIELD. As the lowest responsible bidder.

Mr. FORD. Out of the 10 bids which were received by us or by the Roane-Anderson Co.

Representative HOLIFIELD. Now, a factor might enter in there, in the over-all consideration of this picture, as to whether the Moore Co. can afford to give additional service to these people within the terms of its subcontract. This reduction in clerical services at the desk: does that come out of the Moore Co.'s expenses, or receipts? Or does it come out of the Government's part?

Mr. FORD. The reduction there is the difference between the time when we paid Moore money each month for each dormitory, and the present situation where Moore pays us. From the analysis we have made, we believe that the Federal Government is receiving the entire benefit of the reduction in services; that the Moore Co. is not making additional profit through this decrease in service.

We get occupancy reports for each month, and we can make our estimates based on that daily occupancy as to the actual receipts he obtains from the tenants in those dormitories.

Representative HOLIFIELD. He is under obligation to carry insurance on these buildings?

Mr. FORD. Yes.

Representative HOLIFIELD. He is under obligation to make good any rents that are unpaid?

Mr. FORD. We get a rent paid for every day the dormitory is occupied. If the occupant is a week shy or a month shy, that decreases his income from that, to go against operating cost by that amount. And any insurance carried by him, any liability of any other nature,

any bonds, and so forth, must all come out of what he receives by way of rental collections.

Representative HOLIFIELD. Mr. Franklin, is the figure \$265,000 right for the amount you have estimated would be needed to subsidize the 15 dormitories in the new budget? Is that a correct figure?

Mr. FRANKLIN. I don't recall that figure of \$265,000.

Do you, Fred?

Mr. FORD. That \$265,000 in the new budget includes utilities. And based upon most recent estimates, here, right now it amounts to something on the order of \$257,000. What was that figure you had, there?

Representative HOLIFIELD. \$265,000. That is approximate.

Mr. FORD. At the rate we are going right now, including utilities, it will go to about \$257,000.

Representative HOLIFIELD. Do you have any questions, Mr. Price?

Representative PRICE. I have no questions.

Representative HOLIFIELD. Do you care to make any additional statement, Mr. Ford?

Mr. FORD. Somebody has gone over there to Norris Dam. But I was told out here that, as of last fall, the rate was \$3.75 per week per room. That was later changed. I think that was decontrolled. That was under the TVA. It was later changed, and the rate was made \$5, and the present rate is \$7. I think those three figures will cover it. But we will have a statement relative to that.

Representative HOLIFIELD. Assuming that information is correct, until we do get it verified, the three figures that were given this morning could be explained in this fashion: That the \$3.75 per week under rent control would have amounted to about \$16.08, considering the extra days in the month.

Mr. FORD. That is when it was operated by TVA.

Representative HOLIFIELD. That is when it was operated by TVA. Later on, you say, your information is that they raised that to \$5 per week.

Mr. FORD. \$5 per week; yes, sir.

Representative HOLIFIELD. Which would be \$21 plus, we will say. Then you say that they have now raised it to \$7.50 per week; is that right?

Mr. FORD. To \$7.

Representative HOLIFIELD. To \$7, which would be roughly \$30 per month. We are now referring to the quarters which the Rent Control Director said were the closest to these quarters in comparability of any quarters in the area.

Mr. FORD. Of dormitory quarters, right.

Representative HOLIFIELD. Both as to size and furnishings, and also type of construction.

Mr. FORD. Yes. There might be one other thing, sir.

Representative HOLIFIELD. I think it will be important to the committee to have those figures verified.

Mr. FORD. They are being verified at this very minute.

Representative HOLIFIELD. And we would like to have affidavits as to those figures. Because in your statement of comparability they are the only figures that I recognize, personally, as being a true comparison, or a fairly true comparison. As I understand it, this Norris

place is a smaller place than Oak Ridge. It is more isolated even than Oak Ridge; is it?

Mr. FORD. It is about 15 miles, I believe, east northeast from here. Representative HOLIFIELD. But they do have fishing and boating. [Laughter.]

Mr. FORD. Yes. We have tennis courts and golf and playing fields galore.

Representative HOLIFIELD. Do you have anything to add, Mr. Franklin?

Mr. FRANKLIN. I do not, sir.

Mr. FORD. A statement was made about these dormitories as to their being firetraps, and as to the fires which could take place and have occurred, and so forth.

I believe that the last report from our safety division might be of interest to the committee.

Representative PRICE. You are referring to your dormitories here, now?

Mr. FORD. Yes, sir.

Representative PRICE. What does the report say?

Mr. FORD. It gives the construction, the number of fire escapes, the height of windows on the second floor from the ground, 15 feet, which all fire ladders will reach, and the unusually large number of exit doors which are provided. There are at least nine in each. All are equipped with panic hardware, with doors swinging with the line of exit. Exit lights are properly placed to mark all exits.

In the H-type dormitories, there are 12 metal fire doors, and in the S-type dormitories there are six. These fire doors serve to prevent spread of the fire by sealing off the stairwell, and to protect this means of exit. Fire doors in H-type dormitories are also located to complete the firebreak, which has a 2-hour rating, provided between the wings of the building.

This firebreak consists of a masonry corridor. All fire doors are equipped with fusible links which close the doors when the temperature reaches 160 degrees Fahrenheit. Each S-type dormitory has a fire wall, cutting the building approximately in two, in order to prevent the spread of fire. This fire wall extends several feet on each side of the building and above the roof to prevent the spread of fire from sparks, and so forth.

Water supply is adequate, and fire hydrants are conveniently located to each building. All dormitories are located within one-fourth mile from fire department headquarters, a building which houses two fire companies, or one-third of the total city fire department strength.

On first alarms in dormitories, four fire companies, two-thirds of the total city fire department strength, respond. Each dormitory has a siren to warn occupants in the event of fire.

Each dormitory has the number and type of first-aid extinguishers, soda and acid, water pump, carbon tetrachloride, and carbon dioxide, specified by the Tennessee Inspection Bureau.

Inspections of the extinguishers, as well as all other fire-protective features, are made twice monthly by the Oak Ridge Fire Department.

So far as the fires are concerned, during the calendar year 1948, 40 fires in dormitories were reported to the Oak Ridge Fire Department. All were minor. Fire department apparatuses were sent in

only five cases, and the total damage from all fires was approximately \$200. All but three were out before the arrival of the fire equipment. However, some could have resulted in more extensive damage had they not been discovered in time.

Fire Department records indicate that, of these 40, nine were discovered by dormitory clerks. Of these, three were discovered during their hourly rounds. They reported them to the Oak Ridge Fire Department. Twenty-four were discovered by occupants.

Representative PRICE. Mr. Ford, a number of those were discovered by dormitory clerks, and you are going to be without the services of those clerks from 10 in the morning until 4 in the afternoon.

Mr. FORD. There were nine discovered by dormitory clerks.

Representative PRICE. Any one of the nine might have been a major fire. I would not feel too secure behind a favorable safety report, even from a State fire marshal. Because a fire, if it is not caught right at its inception, can spread very rapidly. I personally am greatly concerned about a situation in which a building of that character is unwatched at any moment during the day. I think that it is a very serious thing, something that you should give very serious thought to. Because you would have a catastrophe here, and somebody would be directly responsible for that. You have a chance now to think of that.

Mr. FORD. The buildings are not only in a fire-department patrolled area, but——

Representative PRICE. So was the hospital at Effingham. That was very close to a fire house.

Mr. FORD. I was going to say that it is also the case that they are close to the police in their tours.

Representative HOLIFIELD. Do they go through the buildings?

Mr. FORD. No; they don't go through the buildings.

Representative HOLIFIELD. They drive by?

Mr. FORD. They drive by. And that is 24 hours a day.

Representative HOLIFIELD. That is true, but an inside fire could very easily start during those hours.

Mr. FORD. An inside fire would ordinarily be detected by someone who lives there, and the maids are in there during the entire time that the dormitory residents aren't in there, because they are in there during their work during the entire morning, at least. You have probably 4 hours of the day, between 12 o'clock and 4 o'clock, when the one who lives there may not be there.

Representative HOLIFIELD. I believe you might save yourself some criticism in the future if you took into consideration those hours in which no one is responsible for guarding those dormitories. It could not amount to a great deal of expense, and it might save a lot of criticism in the future, if an internal fire should break out and destroy those dormitories.

I wanted to speak about the item of theft that was brought into the hearings this morning.

One of the arguments that was brought forward was that thefts had occurred, and frequently did occur. The inference, at least, was given that if you had someone on duty there at all times, these thefts might not occur. But as a matter of fact, these thefts have been occurring during the time when you did have a full clerical staff at the front desks.

Mr. FORD. That is correct, sir.

Representative HOLIFIELD. And so it is probably one of those things which will continue to occur regardless of whether you have a clerk at the front desk or not.

Mr. FORD. That is right. Because let us take an H-type dormitory, for example. There is a clerk at the front desk, but there is a wing going out like this [indicating] and he certainly can't see whether John Jones has a skeleton key going into Jim Smith's room. He certainly can't see that, sitting at a desk.

Representative HOLIFIELD. Is there anything further?

Do you have any further statement that you would like to make Mr. Ford?

Mr. FORD. I have nothing further. Thank you.

Representative HOLIFIELD. Mr. J. S. Thompson and Mr. R. H. Watkins have asked for the privilege of testifying before this subcommittee.

Are they in the room at the present time?

We will invite both of you to come forward and take chairs and identify yourselves to the reporter, please.

**STATEMENT OF ROBERT H. WATKINS, MEMBER, TOWN COUNCIL,  
OAK RIDGE, TENN.**

Mr. WATKINS. Mr. Chairman, my name is Robert H. Watkins.

The members of the dormitory committee asked me to come in and testify before you. I am a member of the Town Council of Oak Ridge. I represent the colored of the area.

Due to the fact that I have been asked to come in, I want to say something about what has been published in the paper about our area.

You will find that in the Negro area the living conditions are deplorable. They are bad. We have temporary hutments which were built during the war years and were occupied in August 1943. Those hutments house single men and women. We have also, in that area, some families. This past week there have been 101 of those temporary hutments that have been removed and torn down.

But I would like to say here that due to the work of this present administration, whom I have been very active in working with, in rectifying conditions over there, we find that things are going to be very much better. You will find that there have been contracts let to build houses. Some of them are being built and have roofs on them.

Representative HOLIFIELD. I might say, for the benefit of the witness, that we toured all that area this morning, and we saw the work of tearing down the hutments. We visited some of the hutments that are still there. We also visited the area where the families are being moved.

We visited the new concrete brick houses on the hill up there that are being built for your people.

You can report that the present administration is vigorously trying to correct the conditions that exist there.

Mr. WATKINS. I will say that. They have called us in on a number of occasions in planning. They had a number of houses that were to be built over there that were too expensive to our wage scale. I asked them personally to cut down on the type of houses they were

building, due to the fact that we did not want them to build a ghost town. They called in a group of us from that area, and talked it over before they made final plans for building.

I would like to state that in September of 1944 Colonel Hodgson was here with the Army and I wrote him a letter and asked him for two dormitories for women and two for men, a school, a church—all that goes to make a community worth living in. It seems we didn't get far then. But, as I say again, this administration is making every effort they can to rectify conditions over there, and make that part of the area equal with the other parts of the area.

Thank you.

Representative HOLIFIELD. I am very glad to have your testimony. We in Congress certainly are aware of the need of improvement in this area over there, and we are behind the administration in correcting a situation which probably would have been corrected long ago, if it had not been for wartime shortages and conditions.

Mr. WATKINS. Yes, sir. That is true, and thank you very much, sir.

Representative HOLIFIELD. Mr. Thompson, would you care to add anything to Mr. Watkins' testimony?

#### STATEMENT OF J. S. THOMPSON, OAK RIDGE, TENN.

Mr. THOMPSON. I have nothing to add other than the fact that we are not living in the past. We know that the conditions have prevailed over there, and that some things are being done about them. What we are primarily interested in there is the future of Negroes at Oak Ridge.

We would like to see Negroes with opportunities to live like other folk. In other words, we would like better jobs here, so that we can get the better type Negro into Oak Ridge.

If facilities are made available for such, we are quite positive that we could fill positions with competent Negroes if the positions are available.

Under the conditions that presently exist, with the type of living that we do, and the conditions that prevail, an effort is being made to make the conditions as livable as possible. If the conditions were better, we would have a better type of people here and we would have better relationships.

The fact remains that if you live like dogs, you will act like dogs.

As I said before, what we are primarily interested in is the future for Negroes at Oak Ridge.

Representative HOLIFIELD. I think you will find that your housing facilities will be improved, and also the school facilities for your children will be improved in the very near future. I understand plans are under way to improve those conditions.

We thank both of you gentlemen for your testimony.

Mr. THOMPSON. Thank you, sir.

Representative HOLIFIELD. Is there any citizen in this hall who would like to appear before the subcommittee and make a statement on some point which has been overlooked? The Chair will extend that courtesy to any citizen who has something worth while to contribute to this testimony.

Mr. Minor has asked for an additional 5 minutes.

Mr. Minor, will you please take the chair?

**FURTHER STATEMENT OF W. H. MINOR, CHAIRMAN, CENTRAL DORMITORY COMMITTEE, OAK RIDGE, TENN.**

Mr. MINOR. Thank you, sir.

Mr. Chairman, we have seen in the testimony that has been given here the break-down of the argument of comparability as it was advanced by Mr. F. W. Ford on the 23d of February in his meeting with the dormitory residents.

We have seen the break-down of the comparability argument which follows the same line, from the Honorable Chairman and Honorable Vice Chairman of AEC, the Production Manager, and the General Manager.

Mr. Ford had said that last March they started checking on comparability. The well and nationally known firm of Tredwell & Goldstein was employed to make that survey, at a given price, from New York.

I wonder what classification that firm is listed in the New York telephone directory. I am unable to find, in any telephone directory of the last 3 years, the name of Tredwell & Goldstein in real estate.

There has been an effort on the part of the officials of AEC to collect information in regard to comparability, since March of 1948; and here today they apparently do not have the facts available. They paid a large sum of money for the report of Tredwell & Goldstein, and I wonder if that report has been introduced into the record, as it applies to dormitories. It has been brought up and has been mentioned here several times.

One factor that has been overlooked entirely is the fact that with the maid service as it is, attempting to take care of one-fifth of each dormitory each day, after the maid has finished her work on Monday, a man could die in his room and would not be discovered for 7 days.

We have just gone through a picture where that happened, and it was 72 hours before the man was discovered dead in his room. That is rather deplorable. And, of course, we have the fire hazard, again.

In the majority of the dormitories, we have the hand pump for putting out a fire. Most of the upholstering in the dormitories is of material which, once it catches on fire, burns very rapidly. And it burns internally, into the cushion, so that when you come to put that fire out, it blazes up and makes quite a fire.

I happened to run into one of those things. That is why I am in a position to speak of it.

If a drunken person in one of those rooms happened to throw a cigarette in one of those chairs and climb into bed, in an hour's time, the walls would be a mass of flames.

I believe that a check with the insurance companies would indicate that the exterior doors to the wooden fire escapes are slightly smaller than they care to assume risks on in insuring the possessions of the tenants.

We came in here, of course, prepared to shoot at comparability, which was the one item outlined by all officials of AEC as being what they were aiming at; and not exact comparability, but something approaching comparability.

We believe that had the chart been factual there would have been no picture of true comparability.

We do believe that, of course—and we have to go back now to something that has been said, and then I will terminate right away—the

costs for maintenance are extremely high. We have painted two large buildings adjoining the city administration building. After they were completely painted, gutters and all that sort of thing, the Roane-Anderson Co. came in and they put on new painters, and now they have to be painted again.

Things like that are very high. Maintenance is very costly. And, of course, we pay \$16,000 a month for management. Good management cuts down maintenance costs.

There is a thought in there for you in the fact that last year, operating 18 dormitories, we paid as high as \$800 per dormitory to have them operated. This year, we operate fewer dormitories, and they pay us for the operation of them. It would seem that in the operation of many dormitories there would be savings.

There is just food for thought in that particular item.

I want to thank you, gentlemen, for your courtesy, and I want you to know that it is extremely appreciated by all of the residents of the dormitories.

Representative HOLIFIELD. We certainly appreciate the time that all of the witnesses have given to this problem, and their testimony before our subcommittee.

We will ask for further information on the Tredwell-Goldstein report. We will explore the fire hazard matter further, and we will inquire into the attitude of the fire insurance underwriters of the State of Tennessee in regard to the situation there.

As to the comparability chart here, I believe it has been testified by Mr. Ford that the information given in this chart has been furnished in most part as a matter of information as to surrounding facilities, without regard to their quality in comparison to the dormitory facilities here, with the exception of the TVA Norris facility, which the letter which you introduced from the rent director showed was possibly the only really truly comparable structure and operation in this vicinity.

Do you have any comment to make on the TVA Norris structure in comparison to this structure, as to whether it is a good comparison or not?

Mr. MINOR. One thing in addition might be said there. I called the rent director this morning, before we went into session, to find out if that area had been decontrolled. It has not been decontrolled. And that is the nearest approach that we have to comparability in the neighborhood.

Representative HOLIFIELD. We will assure the residents, and you as representative of the dormitory group that we will explore that phase of this comparison before making our decision known to the Atomic Energy Commission.

Thank you very much.

Mr. MINOR. Thank you, Senator.

I want to thank everyone who came down here.

Representative HOLIFIELD. Unless there is a further statement to be made by someone in the room, that will close the hearing.

Mrs. EDWARDS. May I make one more statement, please?

Representative HOLIFIELD. Mrs. Edwards.

Mrs. EDWARDS. We forgot to tell you that written into the new contract with Mr. Moore it is stated that dormitory residents get only one clean bedspread, and drapes for their closets, which are without

doors, per year. We get only one per year. If they are laundered, we must launder them.

I think that might be interesting.

Then I want to close with this: Isn't it rather appalling that Roane-Anderson makes so much money in order to lose so much money for the Government? [Applause.]

Representative HOLFIELD. I think that the Chair will allow the lady to have the last word, as usual. [Laughter.]

The meeting is adjourned.

(Whereupon, at 3:15 p. m., hearing in the above-entitled matter was adjourned.)

## APPENDIX

UNITED STATES ATOMIC ENERGY COMMISSION,  
Oak Ridge, Tenn., April 21, 1949.

### MANAGEMENT AND OPERATIONS OF DORMITORIES AT OAK RIDGE, TENN.

#### 1. Space utilized and services rendered

As of this date, 15 dormitory buildings are being utilized to house 745 single men and 745 single women who are employed in various capacities in the Oak Ridge area. There are eight dormitories for women and seven for men.

Twelve regular dormitories, depending on type, contain from 52 to 73 single rooms approximately 9 by 11 feet and from 38 to 42 double rooms, approximately 11 by 13½ feet. Two so-called special dormitories are similar to the regular dormitories except that each contains 34 rooms, approximately 10½ by 11 feet with connecting baths and from 46 to 48 single rooms, approximately 10½ by 11 feet, with connecting baths. Another so-called special dormitory, Covington Hall, which is operated in conjunction with Columbia Hall, and originally constructed as a nurses' home, has 28 single rooms, approximately 10½ by 11 feet with connecting baths.

Each dormitory, exclusive of Covington Hall, has a suitably furnished waiting room on the first floor and a recreation room on the second. With the exception of the special dormitories, all rooms of which have connecting baths, each dormitory has four shower rooms, each containing four shower stalls (with shower curtains in the women's dormitories) and suitable coat hooks on the walls for hanging clothes. In addition, they have four toilet rooms with each room containing four toilet facilities and four lavatories with mirrors and lights over each lavatory.

Each single dormitory room contains a clothes closet with drapes and the following items of furniture: One Hollywood type bed (single), one mirror, one chest of drawers, one desk, one floor or table lamp, one ceiling light, one chair with arms, one chair without arms, and one waste basket. In some cases a throw rug is furnished. The double rooms contain two or more of the furnishings usually found in the single rooms.

In the 15 dormitories being utilized, 767 single rooms are rented for \$15 per month, 94 single rooms for \$20 per month, 473 double rooms at \$10 per living space or \$20 for a single occupant, and 96 rooms with connecting baths at \$25 per month. These rates are the same as those established for the same living accommodations when the dormitories were placed in operation during World War II, and when highly subsidized inducements were necessary to attract working personnel to Oak Ridge.

Currently, the following services are furnished in the dormitories: (1) Public spaces, such as showers, halls, toilet rooms, lobbies, recreation rooms, are cleaned daily; (2) bed linens are changed weekly; (3) rooms are cleaned weekly; (4) two hand towels and two bath towels are furnished each week to each occupant; (5) desk clerk service for men from 4 p. m. to 10 p. m. and for women 4 p. m. to 10 p. m. daily except Sunday, including distribution of mail to boxes and room buzzer service; (6) matron service in women's dormitories from 10 p. m. to 6 a. m. daily (with the exception of Covington Hall, which has never had desk service, being operated in conjunction with Columbia Hall); (7) hourly watchman service in men's dormitories from 11 p. m. to 7 a. m. daily; (8) drapes, rugs, mattress pads, bed spreads, blankets, and closet curtains are laundered or dry cleaned once each year; (9) clean items are provided each new occupant; (10)

walking spaces in the rooms are waxed and buffed every 6 months and the entire floor once each year; (11) windows and door glasses are washed every 4 months; and (12) cutting of grass as required.

In seven of the women's dormitories, kitchens for cooking purposes are provided. These kitchens are 16 by 30 feet each and are furnished as follows: 36 food compartments 16 by 24 inches with locks, 24 lineal feet of linoleum, covered counter top 2 feet wide, 18 lineal feet of metal covered counter top 2 feet wide having places for six hot plate receptacles, three kitchen sinks mounted in linoleum-top drainboard, 3 tables, 12 chairs, and 10 lights. This service goes with the rent. Two of the kitchens in the women's dormitories have refrigerators. In addition, each of the 15 dormitories being utilized has an automatic washing machine on which a 10-cent charge is made. These machines are furnished and serviced by a concessionaire.

Services as specified were previously furnished on the following basis: (1) Desk clerk services were provided 24 hours a day, (2) rooms were cleaned daily and beds made except Sunday, (3) four hand and three bath towels were furnished to each occupant weekly, (4) windows were cleaned every 2 months, (5) waxing and buffing of walking spaces in the rooms was done bimonthly and other spaces semiannually.

## *2. Comparability of services and charges*

Under the current rental schedule for dormitory space, the Atomic Energy Commission, the Roane-Anderson Co., and the James H. Moore Co. feel that the charges are reasonable and the services rendered sufficient. Comparability surveys have been made in this connection.

In March 1948, as part of a study on rental structures in Oak Ridge, the Roane-Anderson Co. was directed by the AEC to engage the services of a nationally known consultant appraisal firm to review all Oak Ridge living accommodations. The firm of Tredwell & Goldstein of New York City was engaged to make the survey, including recommendations to the Roane-Anderson Co. as to rental rates and service policies. Furthermore, Roane-Anderson Co. representatives inspected dormitory facilities in the Washington, D. C., area to secure other comparative data.

Since there were no large groups of dormitories in the communities adjacent to Oak Ridge with which Tredwell & Goldstein could compare living accommodations and recommend rental charges based on comparability, they made their study in the following manner:

They arrived at the room rent value on Oak Ridge residential units other than dormitories by comparison of these units with units in the surrounding areas. They then drew a comparison between dormitory accommodations on the basis of livability to other residential units in Oak Ridge. They then recommended that the cost of providing maid and linen services in the occupied dormitory rooms and the cost of furnishings be added to the recommended rental charge which ranged from \$15 for regular single rooms with no bath to \$22 for special large double rooms with connecting baths. If these recommendations had been followed, the rental schedule would have ranged from \$23.35 for regular single rooms with no bath to \$38.70 per person for special large double rooms with connecting baths.

After careful consideration by both the company and the Commission, it was believed that it would be more acceptable to dormitory residents generally if some of the services were eliminated rather than a raise in the rates. This decision was based on the knowledge that a great many dormitory residents, due to personal considerations, would prefer changes in services to a substantial rate increase. It was planned that the dormitory operator would designate dormitories where more complete services would be provided if a sufficient number of dormitory occupants indicated willingness to pay an additional charge for such services.

A dormitory survey also was made in the Washington, D. C., area. The two-story buildings comprising the federally operated dormitories at Arlington Farms, in the Washington area, were built in 1942. They are considered to be of temporary construction and are similar in construction to Oak Ridge dormitories. The main difference is that each building has additional wings providing 610 spaces while the dormitories in Oak Ridge contain an average of 143 spaces. There also are other buildings on the site such as cafeterias, recreation halls, infirmary, and maintenance shops, all of similar construction.

The room rental schedule follows:

Twenty rooms, double, \$16.50 each occupant.

Two rooms, large double, \$22.50 each occupant.

Three rooms, large double, \$24.50 each occupant.

Five hundred and thirty-six rooms, single, \$24.50 each occupant.

Twenty-one rooms, single; \$28.50 (corner rooms).

The following services are furnished: (1) Rooms are cleaned once a week on an established scheduled day; rooms are dusted, damp mopped, and bed linens changed; two bath towels and two hand towels are provided weekly on an item-for-item basis; room floors are waxed only when the executive housekeeper thinks it necessary; cleaning equipment is available on each wing floor for use by the residents—brooms, mops, wax, etc.; each room is thoroughly cleaned twice a year, walls washed down, etc.; two sheets, one pillow case (each week), two blankets (cleaned once a year by the maids in between seasons), and a bedspread is provided; curtains and bedspreads are cleaned, when required, by the maids; basement facilities are available for washing and drying; windows are cleaned by maids and housemen each spring only. (2) Laundry rooms are on each floor and electric irons are available (no charge). (3) The office desk is open from 7 a. m. to 11 p. m., and mail service is provided 6 days a week. (4) Small kitchens are available for limited use; dishes, utensils, and refrigerators are provided; hours are limited and kitchens are cleaned up by residents.

The single rooms are slightly smaller than the single rooms at Oak Ridge, the double rooms approximately the same.

The furnishings in the rooms are inferior to those at Oak Ridge. For instance, the bed is similar to a cot in construction, light in frame with crossed wire for springs; the mattress is an inner-spring type; blankets are adequate; a small writing desk is included in the single rooms and a slightly larger table in the doubles; in single rooms, a three-drawer dresser and mirror is provided, and in doubles a five-drawer dresser; no rugs are included; residents are permitted to supplement their furniture but only upon approval of the hall director.

The small closet space has a door and a lock which is opened with the guests' door key; corridors have carpet runners the full length.

At the University of Tennessee there are three types of dormitories.

Type 1 is known as the Melrose Dormitory, consisting of three buildings, broken down into seven units. This type of dormitory houses 358 men as follows: 164 men in single rooms, 9 by 12 feet, at \$75 per quarter or \$25 per month per person; and 194 double rooms, 12 by 13 feet, at the same rate per person.

The buildings contain 47 well-furnished living rooms, 200 square feet each. Each unit has a built-in kitchenette in one of the living rooms for special use by students, and an elevator. Each unit has a large social room, 783 square feet in size, and there is one recreation room, 1,500 square feet in size, to serve the three buildings. There are 47 bathrooms throughout the three buildings, each having two showers, two toilet facilities, and two wash basins. Each bath accommodates eight students.

Maid service is furnished daily. Linens, towels, and blankets are not furnished. The clerk service consists of a resident manager and one clerk, assisted by faculty and students. One-way buzzer systems are installed in the rooms, with pay telephone booths in each unit. Draperies and bare pillows are furnished. Each room has a built-in desk for each occupant, a chest of drawers, book shelves, single wood beds with inner-spring mattresses, one lounge chair, a desk chair, a one-drawer night stand and closet space. Each occupant has a post-office box in the mail distribution room.

The second type is the Stadium dormitories, which house 690 men, three to a room, with rates of \$45 per quarter for each occupant or \$15 per month. There are four floors and three large toilet rooms, each having six tile-partioned showers, seven toilet facilities, and seven wash basins with mirrors, and six urinals. It has one large recreational unit. There are two large living rooms on each floor. The bedrooms are 12 by 17 feet and are furnished as follows: One wood double-deck bed, one single bed, one night stand, two desks, one combined desk and chest of drawers, two chests of drawers with mirrors, three desk chairs and one lounge chair. There is no desk service or maid service. The students make up their own beds but janitorial service is furnished. There is a two-way buzzer system. Occupants are required to furnish their own bed linens, blankets, towels, and accessories, including pillows. The buildings are steel and concrete and about 1 year old.

The third dormitory is a temporary structure about 2½ years old, a prefabricated wooden frame building, consisting of rooming quarters only. There is no lounge or recreation rooms. The double rooms are 8 by 11 feet and rent for \$35 per quarter or approximately \$12 a month per occupant. Rooms are furnished as follows: One double double-deck Army type bed with a regular Army mattress, two writing tables, two chests of drawers without mirrors, and two desk chairs.

Occupants are required to furnish their own bed linens, blankets, towels, accessories and pillows. No buzzer systems or telephone facilities are available. No desk service or maid service is furnished. The students make up their own beds, but janitorial service is furnished.

At Norris, Tenn., one wooden frame two-story dormitory with hardwood floors, consisting of 20 rooms, 10 by 10 feet each, is available for occupancy. The dormitory was built in 1933. Forced warm air heats the rooms. The room rates are \$7 weekly or approximately \$30 per month, with one bathroom available on each floor. Each bathroom has four shower stalls, four toilet facilities, and four lavatories with lights over each lavatory. The rooms are furnished with one three-quarter bed, a table, closet, easy chair, and straight chair. Floors are bare.

The dormitory is leased from the Norris Properties, Inc., by a young couple who furnish all services from management to janitorial. The rooms are cleaned daily when in use, linens are changed once a week, and clean towels furnished daily. No buzzer system is furnished nor is telephone service available except in the main office. General custodial service on the premises is available, but no desk clerk is employed.

At the Watauga Dam construction site, a TVA project approximately 150 miles northeast of Oak Ridge, three men's dormitories are in operation, with 88 rooms each, 9 by 9 feet in size. The dormitories are portable type, demountable frame buildings about 6 years old. These rooms rent for \$18.20 a month when occupied by a single person and \$13 per person per month when occupied by two persons. When two persons occupy the room, a double-decker bed is furnished.

The single rooms have one Army-type steel cot, one table, clothes closet, and one chair. The double rooms have one double-decker Army-type steel cot, one table, a double clothes closet, and two chairs.

General janitor service is available with clean bed linen furnished weekly. No towels or soap are furnished. There is no desk or room-clerk service, no telephone service except in two buildings about a block away and no buzzer system. Floors are bare. Janitor service is furnished from 7 a. m. to 3:30 p. m., daily, and watchman service is furnished by three public safety men on 8-hour shifts who patrol an area which also includes the administration building and dam site proper. No mail is delivered to the dormitories from the post office about a block away.

Similar quarters and services are available at the South Holston dam site nearby at the same rates.

In Knoxville the YMCA is a reinforced concrete building with brick walls and bare, cement floors in the rooms. The building, constructed in 1930, has 113 rooms, of which 100 are single and 13 double. All rooms are 8 by 12 feet. The rates range from \$26 minimum to \$28.50 maximum for regular rooms depending on the location, with a discount of approximately \$1.10 if rent is paid in advance.

These rates are applicable to only members of the YMCA. Transient rate is \$1.50 a day. Recreation facilities, including gym and swimming pool, are available to all occupants. Rooms are furnished with a steel dresser, a bed, a desk, an easy chair, and a straight chair.

Desk clerk service is given 24 hours a day, maid service daily exclusive of Sunday, and watchman service from 10 p. m. to 6 a. m. daily. Linens are changed once a week and bath and face towels once a day. A two-way buzzer system is provided with a telephone on each floor. No soap is furnished except to transients. Each floor has a common washroom which contains six lavatories, three showers, three toilet seats, and urinals. Each common washroom serves from 39 to 43 men.

### 3. Nature of contract

Under a general policy of the Atomic Energy Commission which encourages private enterprise to carry forward a great variety of functions in the community, the Roane-Anderson Co. has sublet the dormitory operations to the James H. Moore Co., which has had past experience in real-estate operations on an incentive contract basis.

The contract specifies that the James H. Moore Co. shall pay monthly to the Roane-Anderson Co. \$300 for each men's dormitory operated and \$122.50 for each women's dormitory operated except Covington Hall for which \$100 is paid. There is also set forth the manner in which the existing number of dormitories operated may be increased or decreased.

The specified services furnished by the Moore Co. to tenants have been already enumerated. The Moore Co. is permitted to furnish additional service upon application of the occupants at a price agreed upon between the Moore Co. and the occupant provided the prior approval of Roane-Anderson is first obtained.

The Moore Co. is made responsible for all minor maintenance which includes such items as (1) repair all doors and windows; replacement of hardware and fabrication of keys; do all minor maintenance on doors, screens, furniture. (2) Repair electric buzzer, lamp cords, and replace light bulbs and fuses. (3) Repair and replace faucets, water valves on individual fixtures; repair registers to the heating system.

The Roane-Anderson Co. is made responsible for all major maintenance and structural repairs and the replacement of worn-out fixtures and Government property furnished as a part of the building.

The rents charged are specified in the contract and cannot be changed without approval of the Roane-Anderson Co. The Moore Co. collects and retains gross receipts which are applied against the operation costs. The Moore Co. reports monthly to the Roane-Anderson Co. the occupancy of each dormitory operated.

The Roane-Anderson Co. inspects the premises and the operation of the business to insure that the Moore Co. provides the services and maintenance required by the contract.

All utilities are furnished by the Roane-Anderson Co. and include electricity, water, heat, sewage, refuse removal, and refrigeration service.

The estimated financial result to the Government under the new arrangements follows:

*Estimated Oak Ridge dormitory operation costs*

Dormitories	Fiscal year 1949 budget submission	Estimated 12-month total <sup>1</sup>		Savings
		Old basis	New basis	
Administration (RA general overhead)-----	\$31, 871	\$36, 997	\$33, 167	\$3, 730
Supplies and materials-----	8, 691	8, 307	8, 307	0
Routine maintenance-----	207, 046	82, 901	42, 251	2 40, 650
Nonrecurring maintenance-----	53, 405	61, 244	61, 244	0
Operation (subcontract services) <sup>2</sup> -----	159, 502	89, 427	3, 927	85, 500
Miscellaneous revenue-----	0	(777)	(777)	0
	460, 515	278, 099	148, 119	129, 980
Utility services (included under appropriate utility in the budget):				
Water-----		484	484	0
Electricity-----		6, 986	6, 986	0
Steam-----		101, 360	101, 360	0
Total, utilities-----		108, 830	108, 830	0
Total, estimated costs <sup>4</sup> -----		386, 929	256, 949	129, 980

<sup>1</sup> Estimates on the old basis are based on Roane-Anderson Co. experience for 7 months ended Jan. 31, 1949, after giving effect to the following changes in status of dormitories:

	Active	Standby for security	Idle
July 1, 1948-----	18½	4	16
Oct. 20, 1948-----	16½	4	18
Jan. 31, 1949-----	15½	4	19
Mar. 8, 1949-----	14½	4	20

The old basis is based on actual number of active dormitories in fiscal year 1949 as shown in the table above. The new basis is based on 14½ active dormitories for a 12-month period.

<sup>2</sup> Routine maintenance savings on new basis consist primarily of approximately \$234 per month per dormitory.

<sup>3</sup> This represents net operating costs to the Government and includes allowance either for payment to or payment from the operator together with costs of other subcontract services such as refrigerator service, boiler firing, fuel and fuel delivery, and refuse removal. The operator pays for his expense and retains a profit out of rental receipts received from dormitory residents. The operator has informed the Roane-Anderson Co. that during the 7 months through January 1949, his rental receipts totaled \$195,989.

The recent negotiations between the Roane-Anderson Co. and the operator, which modified the original lump-sum contract, involved adjustments of services and maintenance responsibilities provided by the operator and consequent adjustment of monetary considerations for the benefit of the Government. The adjustment of monetary considerations was negotiated on the basis of estimated cost of services to be eliminated and of the additional maintenance burden to be assumed by the operator.

<sup>4</sup> These costs do not include land rental, depreciation, or amortization on structures or equipment

#### 4. History of dormitory operations

Dormitories in Oak Ridge, as are all other buildings and property in the community, are Government-owned. Operation of dormitories is the responsibility of the Roane-Anderson Co., a cost-plus-fixed-fee contractor which carries out and supervises a wide variety of municipal and real-estate functions in Oak Ridge.

On December 11, 1943, the United States Army, through the Manhattan District, assigned responsibility for the operation of the Oak Ridge dormitories to the Roane-Anderson Co. At that time, 17 dormitories, housing 2,300 individuals, were in operation.

The number of dormitories increased until dormitory occupancy eventually reached a peak of over 13,000 in May 1945 when 80 dormitories were being operated.

The services provided dormitory occupants during this period were almost equivalent to the services that many hotels provide to their guests, in that daily, except Sunday, maid and linen service was furnished and 24-hour desk clerk and message services were provided.

The type of services maintained, combined with an extremely low rental schedule, created a condition that made it necessary for the Government to underwrite a large subsidy.

The fixing of a rent schedule at that time was influenced by the then prevailing conditions of security restrictions, unpaved streets, lack of curbs, gutters, drainage, sidewalks, and grass, inadequate commercial and recreational facilities, etc. The rental was set low to offset these conditions. As of this date, the Government has spent millions of dollars to correct or improve these conditions. Although many of the conditions that established the difference in rental rates have now been eliminated and living conditions in Oak Ridge have improved to a considerable degree, the rental rates have remained unchanged.

In the spring of 1945 it became apparent that the peak of the dormitory population and employment on the area would soon be reached. Discussions then were held regarding operational changes that could reduce Government costs. It was decided that every effort would be made to interest private business in operating the dormitories.

Competitive proposals were then taken for operation of either all or part of the dormitories on an incentive-contract basis. The operation of 12 dormitories was contracted to the Leatherman & Alley Co., of Old Fort, N. C., July 16, 1945. On August 20, 1945, the operation of the balance of the dormitories was contracted to the Galbreath & Moore Co., of Columbus, Ohio. Both contracts were let on the basis of the best bids.

Both the Leatherman & Alley Co. and the Galbreath & Moore Co. were required to furnish all personnel needed to provide such services as desk-clerk services, room assignments, custodial services, maid and linen services, firing of heating plants and maintenance of the heating equipment, minor maintenance on the structure and the equipment, exclusive of the furnishings, and other items. Roane-Anderson was responsible for major maintenance items, laundering and furnishing of linens, drapes and blankets, replacement of furniture and defective equipment, and other items.

Shortly afterward occupancy gradually decreased, due to some curtailment of production operations and the completion of the majority of construction projects. This made it possible to close some dormitories. On September 15, 1946, since only four of the dormitories operated by the Leatherman & Alley Co. were active, they were transferred to the Galbreath & Moore Co. contract, which was extended for a year and subsequently extended to January 31, 1948. On September 15, 1946, 40 dormitories were being operated and on January 31, 1948, at the expiration of the contract, on 21 dormitories were active. Each time the contract was extended, cost to the Government was decreased.

In November and December of 1947 specifications for the operation of 18 dormitories and three efficiency apartments were advertised. Competitive bids were taken December 3, 1947. Forty-nine private companies and individuals requested specifications and bid forms. Ten bids were received.

The James H. Moore Co. of Oak Ridge was low bidder and was awarded the contract by the Roane-Anderson Co. with the approval of the Atomic Energy Commission, which had taken over operations from the Manhattan District January 1, 1947.

After discussions in September and October of 1948, it was decided to negotiate contract modifications with the Moore Co. for dormitory operations subsequent to January 31, 1949, subject to securing a fair price, rather than to

take competitive bids. When this decision was reached, a final determination had not been made as to the rental schedule and service policy that would be followed after January 31, 1949. It was therefore not possible to complete negotiations with the Moore Co. at that time.

The decision to change dormitory operations was based on a stated policy of the AEC to reduce operation costs wherever possible and because it is obviously no longer necessary to offer highly subsidized inducements to attract personnel.

On January 18, 1949, representatives of Roane-Anderson and the Commission decided that the rental schedule would not be changed but services furnished dormitory occupants would be decreased, effective March 1, 1949. The company then completed negotiations with the Moore Co. and extended the contract then in effect through February 28, 1949, and reached an agreement on a modified contract to become effective on March 1, 1949, and expire on February 28, 1950. The Moore Co. notified dormitory residents January 31, 1949, that service policies would be changed March 1, 1949.

The decision to negotiate contract modifications with the Moore Co. rather than obtain competitive bids was based on the following: (1) It was believed that reductions could be effected by the Moore Co. with less inconvenience to the tenants and with less impact on production operations on the area than would result if the reductions in services became effective at the same time that a new and, in all probability, inexperienced operator, took over operation of the dormitories. It was, therefore, considered to be to the best interests of the Government to negotiate modifications, providing satisfactory terms reflecting a fair credit to the Government for the value of the contract changes could be obtained. (2) The contract had originally been awarded the Moore Co. as lowest bidder of 10 who submitted proposals after Roane-Anderson had completely canvassed the field for dormitory operators. (3) The Moor bid had been lower than the company's estimate. (4) It was the opinion of the company and the AEC that all bids that could be obtained by competitive bidding would reflect a higher cost to the Government than would result from negotiating on the value of the contract modifications with the Moore Co. This opinion was based on the fact that the operating costs of most service contractors, both nationally and locally, had increased since February 21, 1948.

Both the AEC and Roane-Anderson believed that the consideration provisions of the modified contract negotiated with the Moore Co. to become effective March 1, 1949, reflects a fair credit to the Government for the value of the contract changes. This opinion is based on estimates of the decrease in operating expenses of the Moore Co. that will result from the decrease in services provided occupants and the additional expenses incurred by the Moore Co. by the assumption of maintenance responsibilities not required by original specifications.

It has been and is the policy of AEC, wherever practicable, to contract with private enterprise, including small businesses, for the operation of services and facilities required by the Atomic Energy program. In keeping with this policy, the Commission has entered into an increasing number of contracts and sub-contracts including such a wide range as those with Carbide, Roane-Anderson, American Industrial Transit, Skidmore, Owings & Merrill, The Oak Ridger (daily newspaper), WATO (radio station), the theaters, the Guest House, grocery, meat market, drug, department, clothing stores, and so forth.

The modification in the Moore contract reflects the publicly announced policy of the AEC to adjust rentals and services in the towns operated by them toward comparability with those prevailing in the surrounding rent-controlled areas. In justice to the whole body of American taxpayers, the AEC feels that high subsidies can no longer be continued in housing operations.

After careful consideration by the company and the Commission, it was believed that it would be more acceptable to the dormitory residents generally to achieve a part of the necessary reduction in net loss to the Government by eliminating some of the present services rather than by raising the rates. An important factor in this decision was a knowledge that some dormitory residents, due to personal considerations, would prefer changes in services to a substantial rate increase.

Even at the present rates and newly specified services, the Government will continue to lose money on dormitory operations. The savings to be realized from the service changes which went into effect March 1 will go to the Government and will yield a substantial reduction in the net loss of the operation.

UNITED STATES ATOMIC ENERGY COMMISSION,  
Oak Ridge, Tenn., May 24, 1949.

MR. WILLIAM L. BORDEN,  
*Executive Director, Joint Committee on Atomic Energy,  
Room 4-A West Terrace, Capitol, Washington, D. C.*

DEAR MR. BORDEN: At the hearings on dormitory rentals at Oak Ridge, Tenn., on April 21, 1949, Hon. Carl T. Durham, chairman of the subcommittee, requested that the subcommittee be furnished information regarding the cost of family housing operations in Oak Ridge including the average revenue and the loss per unit per month.

The enclosed statement shows actual maintenance and operating costs and revenues for the 9 months of the current fiscal year ended March 31, 1949, together with an estimate of what the costs and revenue would have been if the recently announced new license agreement had been in effect during that period.

Under the terms of the new license agreement maintenance services furnished by the company to occupants of family housing units more nearly approach the services normally furnished by landlords. This will result in an estimated saving of \$3.52 per month, per housing unit, to the Government; however, the cost to the tenants for the routine maintenance which they will assume under the new agreement will vary from \$0.58 per month to \$1.75 per month, per unit. It should be noted that this is less than the estimated savings to the Government. There are several reasons for this difference, such as—

1. The average costs to the Government for fuse changes performed by Roane-Anderson Co.'s forces is \$2.18. This cost is high since an electrician and a truck are required. Also 24-hour maintenance service is provided. A tenant can purchase a fuse for 10 cents and should be able to change it himself in a few seconds.

2. The average cost to the Government for repair of leaky water faucets involving replacement of washers is approximately \$1.93 when performed by Roane-Anderson. Again the cost is high for the reasons given in No. 1 above. The cost to the tenant would be only a penny or two for a washer and 10 or 15 minutes of his time.

Under the new license agreement, revenues collected will increase approximately 18 percent. During the 9-month period reflected by the enclosed statement, the average monthly revenue per unit would have been \$43.63 instead of the actual revenue figure of \$37.

A great many savings have been accomplished during the current fiscal year prior to the announcement of the new license agreement. For example, average monthly housing costs of \$585,460 during the first 6 months of the fiscal year were reduced to an average of \$384,741 during January, February, and March, 1949.

We hope that this reply fully responds to Congressman Durham's request.

Very truly yours,

J. C. FRANKLIN,  
*Manager, Oak Ridge Operations.*

## OAK RIDGE OPERATIONS, FAMILY HOUSING COSTS, FISCAL YEAR 1949 (INCLUDING ELECTRICITY, FUEL, AND WATER)

*Comparative statement—Previous and new agreements—9 months (July 1, 1948–Mar. 31, 1949)*

	Previous license agreement (actual)	New license agreement (estimated) <sup>1</sup>
Operating and maintenance costs.....	<sup>2</sup> \$4,666,982	<sup>2</sup> \$4,378,982
Average operating and maintenance cost per month.....	518,554	486,554
Average operating and maintenance cost per month per unit (based on 9,098 units).....	<sup>3</sup> \$57.00	\$53.48
Revenue (97 percent occupancy).....	3,029,595	3,572,524
Average revenue per month.....	336,622	396,947
Average revenue per unit (based on 9,098 units).....	37.00	43.63
Net loss per unit per month (operation and maintenance only).....	20.00	9.85
Estimated amortization, interest, normal taxes (see exhibit A attached).....	32.97	32.97
Total, estimated loss per unit per month.....	52.97	42.82

<sup>1</sup> Column headed "New license agreement" represents estimate of what costs would have been during the 9 months ended Mar. 31, 1949, if the new license agreements had been fully in effect during that period. The estimated savings in maintenance and operating costs under the new license agreements is approximately \$32,000 per month, or \$3.52 per unit per month, to the Government. However, during the past 9 months under the previous license agreements reductions in cost amounting to an average of \$22.07 per unit (see footnote 3) have already been accomplished.

<sup>2</sup> The actual cost of fuel and fuel delivery has been adjusted to average monthly cost for the year for comparability purposes, since the revenue received from tenants is on a flat monthly basis. The actual cost for fuel was \$329,904 for the 9 months; however,  $\frac{1}{12}$  of the estimated annual cost of \$370,904 has been included in the operating and maintenance costs; \$4,119,782 was the actual cost of maintenance and operations, including fuel proration as noted above, and also including costs for such major maintenance items as prepaint repairs, painting, reroofing, and repairs to foundations, porches, and drainboards. To this has been added \$547,200 for electricity and water utilities, to arrive at the total cost of \$4,666,982 for operating and maintenance cost as shown above.

<sup>3</sup> The operating and maintenance costs for the 6 months of July through December 1948 averaged \$64.35 per month per unit, while the costs for January, February, and March, 1949, averaged \$42.28. The total costs adjusted as indicated above for fuel costs for the first 6 months was \$3,512,760, and for January, February, and March, \$1,154,222. Under new tenant-landlord maintenance policy, estimated costs, based on January, February, and March rate of expenditures, would have been approximately \$38.76 per unit per month.

NOTE.—Revenue and expense for refrigerators is included in the "Previous license agreement" column. This statement does not include hutments, farm houses, and trailer lots.

## EXHIBIT A

*Oak Ridge operations—family housing costs, estimates of amortization, interest, and normal taxes*

Total capital cost of 9,098 housing units (except hutments, dorms, farms) <sup>1</sup> -----	\$40,594,679
Obsolescence (wartime planning, etc.) <sup>2</sup> -----	5,661,448
Adjusted cost-----	34,983,231
Average purchase cost of land (residential), 3,200 acres, at \$45 per acre-----	144,000
Total-----	35,127,231
Weighted amortization over 15 years (annual charge) <sup>3</sup> -----	2,332,215
Cost of financing investment (1½ percent on midterm value) <sup>4</sup> -----	263,454
State and county taxes \$3 per \$100, 45 percent valuation (\$15,-807,254) <sup>5</sup> -----	474,218
Local taxes \$3.35 per \$100, 45 percent valuation <sup>6</sup> -----	529,543
Estimated amortization, interest, and normal taxes-----	3,599,430
Estimated annual carrying charge, per unit (9,098 units)-----	395.63
Estimated carrying charges per month, per unit (9,098 units)-----	32.97

<sup>1</sup> The total capital cost of housing is based on data contained in the narrative cost report, vol. IV, 1946, as prepared by Stone & Webster to the Manhattan district. The cost of construction includes only 9,098 units of specific type which were available for occupancy during the first 9 months of fiscal year 1949. Construction costs are initial costs and include no improvements made subsequently, except in the case of the H and S type efficiency apartments where only the cost of conversion was used. The cost does not include cost of site grading or utilities 5 feet beyond the building line, nor does it include costs of furnishings in furnished units or the costs of providing and installing ranges and refrigerators.

<sup>2</sup> The obsolescence is based on factors recommended by the architect-engineer firm of Skidmore, Owings & Merrill per letter dated Apr. 9, 1948. The obsolescence factor is necessary in order to take into consideration certain features in planning, space arrangement, type of equipment, etc., which, although suitable to wartime conditions, is less acceptable for peacetime living and therefore affects value regardless of physical condition.

<sup>3</sup> Amortization was computed separately for each type of building and weighted by the individual adjusted cost per unit. Data were based on appraisal of remaining economic life made in 1948 and published in the preliminary master plan for the city of Oak Ridge as prepared by the firm of Skidmore, Owings & Merrill. These data were then adjusted to the date of actual construction. Cost of land is not amortized.

<sup>4</sup> Cost of financing the investment at a nominal annual rate of 1½ percent interest over a period of 15 years was used.

<sup>5</sup> State tax is based on the 1948-49 tax rate for the State of Tennessee, which was \$0.08 per \$100 value based on 45 percent valuation. The county tax rate was based on the 1948-49 tax rate for Anderson County, which was \$2.92 per \$100 value based on 45 percent valuation.

<sup>6</sup> The local tax rate is based on the average for Nashville, Chattanooga, Knoxville, Johnson City, Jackson, and Kingsport, Tenn. This rate (\$3.35) was used, although the rate as recommended by the J. L. Jacobs & Co. report on survey of incorporation of municipal government in Oak Ridge, Tenn., dated January 1949, is \$4.75. The \$4.75 rate is based on furnishing comparable level of municipal services as now obtained and does not include normal landlord functions. Based on the J. L. Jacobs Co. report, 18.66 percent of the total cost of municipal functions should be borne by taxation from the residential real property included herein.

Estimated annual costs of municipal functions (9 months actual costs, \$3,323,763)-----	\$4,431,684
Annual costs to be borne by taxation on housing, 18.66 percent of \$4,431,684-----	826,952

Estimated local taxes of \$529,543 is \$297,409 less than the \$826,952 estimated municipal expenses to be borne by family housing in order to maintain the current kind of municipal services in Oak Ridge. A tax rate sufficiently high for this purpose would add \$2.72 per month per unit to the local taxes (item 6 of exhibit A).

NOTE.—Exhibit A has been prepared to show that under a normal landlord method of operation a certain return would have to be obtained through the rental revenue to offset certain fixed carrying charges over which the landlord had no control. Exhibit A does not include such normal items as maintenance of buildings, rental-collection expenses, vacancy loss, and overhead.

# SELECTION OF SITE FOR REACTOR TEST STATION

---

THURSDAY, APRIL 14, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The committee met at 10:30 a. m., pursuant to call, in room 318, Senate Office Building, Senator Brien McMahon, chairman, presiding.

Present: Senator McMahon (chairman); Representative Durham (vice chairman); Senators Johnson of Colorado, Tydings, Hickenlooper, and Knowland; Representatives Price, Kilday, Jackson, Cole, and Hinshaw.

Also present: Senators Murray, Taylor, Miller, Ecton, and Watkins; Representatives Mansfield, D'Ewart, and Sanborn; and William L. Borden, executive director of the joint committee.

The CHAIRMAN. The committee will come to order, please.

This hearing is being held at the request of the congressional delegation from Montana, of which Senator Murray is the senior member. The two Senators and the House delegation joined in asking that this committee give the Montana delegation and the Governor an opportunity to present their reasons why they believe a mistake has been made in the decision of the Atomic Energy Commission to locate a very large atomic development near Pocatello, Idaho.

I might say for the record the joint committee had a very lengthy session with the Commission before the choice was publicly announced. At that time we received from the Commission the standards it had used in selecting the site, and we were told that the choice had narrowed down to three sites.

Subsequently thereto, the Commission, after weighing the factors involved, decided on the Pocatello site.

The committee has discussed this, and it is not the opinion of the committee that we should sit as a trial board, so to speak, to determine whether or not the plant should be in Idaho, or whether it should be in Montana or anywhere else. That is for the Commission, under the law, to decide. The duty of the joint committee is to see to it that that decision is not made capriciously, without reason and without evidence. And it goes without saying that it was not made as a result of undue influence, which is not alleged by anyone concerned with this proceeding.

Those two grounds would be the only reasons, as I see it, that would warrant the joint committee in interfering or attempting to interfere with the choice of the site by the Commission. I state this so the limitations of this hearing may be defined.

The Commission, as I have said, has appeared and has told us of the care they have used, the tests and standards which they have set

up. It was for them to weigh the evidence as to the sites against those tests and against those standards.

With that statement, we will be glad to hear the first witness. But I will ask if any member of the committee wishes to add anything before we proceed.

Does that cover the subject, gentlemen?

Mr. Loble, will you give your full name?

**STATEMENT OF LESTER LOBLE, ATTORNEY, HELENA, MONT.**

Mr. LOBLE. My name is Lester Loble. I am an attorney of Helena, Mont., here with the Montana delegation in the interest of Fort Peck and the establishment of the plant there and to present proof within the limitations prescribed by the chairman.

The spokesman for the Montana delegation will be, as I understand, Congressman Mansfield. We are going to present three witnesses. We have other witnesses, but we have confined our presentation to factual matter and have so restricted the material to be presented that it can, we believe, be covered by them. We have others who are available to supply facts and information, but they will not be called unless it is the request of the committee.

After the presentation of the statement of Congressman Mansfield, we shall call upon the Governor of the State of Montana, John W. Bonner, who sits at my right and is here to make a statement on behalf of the State of Montana. Then we shall call upon Gerry Skibbins, industrial engineer for the Montana Chamber of Commerce, who has spent a long time on this matter, Mr. D. P. Brown of the Great Northern Railroad, assistant freight traffic manager, and Mr. Paul Campbell of Fort Peck, or Glasgow, Mont., a hotel man there and a member of the chamber of commerce.

We have other witnesses here, including Mr. N. J. Holter, physicist, who is not a member of the Montana delegation, but has been requested to assist us in the interpretation of technical matters, and is a former senior physicist in charge of wave measurements with the Bikini expedition, who is here with us, but we are not calling any witnesses other than these three in our delegation, and our Governor.

If that covers it, I shall now call upon Congressman Mansfield. It is the wish of the delegation, as I understand it, that he speak on behalf of all of them in addressing the committee.

The CHAIRMAN. Before the Congressman starts, there has been handed to me a memorandum, which is very short and which I would like to put in the record.

(The memorandum is as follows:)

The Atomic Energy Commission hired the firm of Smith, Hinchman & Grylls, Inc., architects and engineers, 243 West Congress Street, Detroit, Mich., to make a survey report on the Fort Peck, Mont., and Pocatello, Idaho, sites in January. The following excerpts were taken from their report to the Commission dated March 26, 1949:

"The general conclusion favoring Pocatello was reached after a thorough consideration of the many factors involved in a selection of site for this project. In respect to all of these factors, except isolation, the area selected is believed to be superior to the Fort Peck site. Pocatello offers advantages as to climate; geology; availability of manpower, land, and materials of construction; transportation; and social-economic factors. Fuel, electric power, water, and con-

struction costs will be less at Pocatello, and in respect to drainage and security this site offers further advantages."

The factors referred to will be put in the record. I will not go through them all.

(The factors referred to as involved in the selection of the site are as follows:)

Factor	Site		Preferred
	Fort Peck	Pocatello	
Isolation.....	Very good.....	Good.....	Fort Peck.
Security.....	Good.....	Very good.....	Pocatello.
Climate.....	Poor.....	Fair.....	Do.
Geology.....	Good.....	Good.....	Do.
Drainage.....	Fair.....	do.....	Do.
Water supply.....	Very good.....	Very good.....	
Manpower.....	Poor.....	Fair.....	Do.
Materials.....	Fair.....	Good.....	Do.
Social factors.....	Poor.....	do.....	Do.
Land.....	Very good.....	Very good.....	
Costs.....	Fair.....	Good.....	Do.
Transportation.....	Poor.....	do.....	Do.
Electric power.....	Very good.....	Very good.....	Do.
Fuel.....	Fair.....	Good.....	Do.

The total project investment and the annual operating costs are:

	Project invest- ment	Annual operat- ing costs
Fort Peck.....	\$522,750,000	\$34,521,000
Pocatello.....	466,860,000	30,099,000
Difference.....	55,890,000	4,422,000

In just one factor, namely, that of isolation, Fort Peck was "preferred." In the factors of security, climate, geology, drainage, manpower, materials, social factors, costs, transportation, electric power, and fuel, Pocatello led Fort Peck. And the engineers found the total cost would be \$55,890,000 less on an investment basis at Pocatello and the annual operating costs would be less by \$4,422,000. The total project investment at Fort Peck was estimated at \$522,750,000, and at Pocatello \$466,860,000.

Mr. LOBLE. Our testimony, Mr. Chairman, will be largely directed to matters contained in that report, those things that you have read there. Smith, Hichman & Grylls, Inc., is, as I understand it, a private architectural firm that made this examination. That report has been furnished to us.

We might add, in passing, that one of the gentlemen on there, the chief geologist, I believe, is from Idaho, and when he speaks about climate, and so forth, we think we have things here that we can show to refute much that is said in that report.

May I now call upon the Congressman?

The CHAIRMAN. Go ahead.

Mr. LOBLE. Congressman Mansfield?

# STATEMENT OF HON. MIKE MANSFIELD, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF MONTANA

Representative MANSFIELD. Mr. Chairman and members of the committee, in connection with what Mr. Loble has just said, I would like to call to the attention of the committee that the first chance I had to see this report put out by this Detroit concern was yesterday evening in Senator Murray's office. At that time I read to the assembled Montanans the letter of transmittal from this firm, signed by a Mr. Grubb, as I recall, to the Atomic Energy Commission. I have not had a chance to go through that report as thoroughly as I would like to, and I just want to call that to the attention of the committee, so that they will understand why I am in ignorance of various parts of it.

I would also like to tell you that the first that I heard about this particular matter was on February 18, when I received a letter from the Governor of the State of Montana, dated February 14. His letter reads as follows:

DEAR MIKE: I notice in the Great Falls Tribune under date line Washington, February 10, it is proposed to build an atomic fuel plant in the West.

I am wondering if you know anything about it, and if we might have a chance to get the project.

With best regards,

JOHN W. BONNER, *Governor.*

I cite that to indicate a number of things.

First, of course, it was the first indication I had that there was a possibility of anything of this sort happening in Montana. I had not even heard a rumor prior to that time. Secondly, it indicates that the Governor was awake to his responsibilities and, on the basis of an article in a Montana newspaper, immediately contacted me and asked me to see what I could do in behalf of this project.

I got busy. And I might say too, for the record, that every member of the Montana congressional delegation, Senators Murray and Ecton, Congressman D'Ewart, and I, did everything we possibly could and have been doing everything we can in behalf of this project for Montana, because we feel that we have the ideal site in the Fort Peck-Glasgow area. We have plenty of power, and when the additional generators are put in we will have 105,000 kilowatts' capacity. We have all kinds of land. We have people who want this project. And we feel that we have the conditions which will make this project a success.

It is important to our State that we get this development, because while we have been treated very well in the matter of Canyon Ferry, Hungry Horse, and construction on the Missouri River in general, nevertheless we have to recognize the fact that during the war, because of a lack of industry there, we lost population. We were not considered during the war effort, and consequently our people went to the west coast to find employment.

The answer to Montana's development in my opinion—and I have worked on this policy in my 7 years in the Congress—is the development of cheap low-cost hydroelectric power. In my district alone we have one-tenth of the hydroelectric potential in the entire United States. This is a public power project, at Fort Peck; and these gentlemen would not be here if they did not see an opportunity to use this power. It is power obtained from facilities put in at the expense

of the people. This power was designed to do a number of things, as far as the Missouri River is concerned, and these things are being done, but it was also designed to be developed for plants of this kind.

I submit, gentlemen, that on the basis of the record, we have everything that you could possibly expect for a nuclear reactor plant of this kind. And I hope that it is still not too late to see to it that Montana is given a fair deal in this particular matter, and that we will be able, even at this late date, to get the nuclear reactor plant there. I speak, I know, for the full Montana congressional delegation, and with their wholehearted approval.

That is all, Mr. Chairman, unless the committee has questions.

The CHAIRMAN. Are there any questions, gentlemen?

Representative JACKSON. Mr. Chairman?

The CHAIRMAN. Mr. Jackson.

Representative JACKSON. I would like to say at the outset that my good friend Congressman Mike Mansfield from Montana has been most diligent in this matter, because I know that he has been pursuing me from time to time with a great deal of diligence in behalf of his great State. I would like to ask Congressman Mansfield this question: When did you first hear about the proposed atomic plant being considered in the West, and from what source?

Representative MANSFIELD. Mr. Jackson, as I have indicated in my testimony, the first indication was a letter from the Governor of Montana, who in turn got his information from an article which appeared in the Great Falls Tribune. His letter is dated February 14. I received his letter February 18. And I think I acknowledged it the same day, telling him that I would get busy on this and would do all that I possibly could.

Representative JACKSON. Thank you.

That is all, Mr. Chairman.

Representative COLE. Mr. Chairman?

The CHAIRMAN. Mr. Cole.

Representative COLE. Mr. Mansfield has given a very fine statement here. But I am curious to know what your recommendation to this committee might be, Congressman. What is there that this committee or the Congress can do in this controversy?

Representative MANSFIELD. I do not know, I will say to the gentleman from New York. But in response to a request from Mr. James J. Flaherty, president of the Montana Chamber of Commerce, the Montana delegation requested the chairman of this committee for a hearing, so that all the facts could be known, and so that, if there was any possibility whatsoever that we could still be considered, we could be given the consideration which we think we are entitled to.

Representative COLE. Is it your position, then, that the Commission did not give the Fort Peck situation ample and thorough consideration before it reached its decision?

Representative MANSFIELD. I am quite sure that the Commission through its experts, gave all these proposed areas consideration. I do feel, though, that on the basis of what information I have at my disposal we have just as good a site at Fort Peck as they have at Pocatello. Furthermore, we have the power right there at Fort Peck which can be used, and which at the present time is in part going out of the State. I want to see that power retained in Montana for the

building up of our State, giving opportunity to our people, and bringing in such projects as this nuclear reactor plant, which will furnish employment and give opportunities to the people in this area.

Representative DURHAM. I am quite sure the gentleman from Montana has been quite diligent in seeking this operation. Does the gentleman know how many sites were in this picture to begin with?

Representative MANSFIELD. Yes, sir. I saw the information yesterday. It may be in that letter which transmitted the report. I think there were 72 sites in the beginning, which were later reduced to 23, and then eventually reduced to 2; although in connection with those 2, Pocatello and Fort Peck, it would be well to state that on the basis of what Mr. Warner, chief engineer of the Atomic Energy Commission, and Mr. Lilienthal told us, there were 2 sites in the immediate vicinity of Pocatello which they considered a little better than ours.

Representative DURHAM. I bring that out because of the fact that there were other locations turned down also throughout the country, quite a number of them.

Representative MANSFIELD. Yes. I might say also, Mr. Chairman, if I may, that a lot of statements have been appearing in the press of Montana, allegations and the like. I have wherever possible taken those statements down, and I have tried to contact the proper authorities and to get answers to all these questions; which I will either put in the record of these hearings, or put in the record on the floor of the House, so that the people of Montana will know just what has been done by their delegation back here in behalf of this particular project.

The CHAIRMAN. Have you got them in such shape that you could put them into this record?

Representative MANSFIELD. Yes, sir.

The CHAIRMAN. I would like to have them, because I have seen several comments in a number of Montana papers that were absolutely without any foundation in fact whatsoever.

Representative MANSFIELD. I will be delighted to put them in the record, Mr. Chairman. And I am delighted also that this is an open and public hearing so that the people will know what is being done, or attempted as to this project.

(The material referred to is as follows:)

STATE OF MONTANA,  
OFFICE OF THE GOVERNOR,  
Helena, February 14, 1949.

HON. MIKE MANSFIELD,  
*Representative from Montana,  
House of Representatives, Washington, D. C.:*

DEAR MIKE: I notice in the Great Falls Tribune, under date line Washington, February 10, it is proposed to build an atomic fuel plant in the West.

I am wondering if you know anything about it and if we might have a chance to get the project?

With best regards,

JOHN W. BONNER, *Governor.*

HON. JOHN W. BONNER,  
*Governor, Helena, Mont.*

FEBRUARY 18, 1949.

DEAR JOHN: This will acknowledge receipt of your letter of February 14, which I have read with much interest.

I will look into the matter of a proposed atomic fuel plant to be constructed in the West and you may be assured that I will do all I can to see that Montana is considered as a site. As soon as I have any information, I will write you.

Must close now, but with best personal wishes, I am,

Sincerely yours,

MIKE MANSFIELD.

---

UNITED STATES ATOMIC ENERGY COMMISSION,  
*Washington 25, D. C., March 25, 1949.*

HON. MIKE MANSFIELD,  
*House Office Building, Washington, D. C.*

DEAR CONGRESSMAN MANSFIELD: Recently members of the Atomic Energy Commission and its staff discussed with you considerations that have governed the Commission in its choice of a site for a reactor testing station. This letter supplements those discussions and replies to your letter of February 18, 1949.

Nuclear reactors are of extreme importance to the atomic energy program since improved forms of reactors will be the basic mechanisms for industrial power or, for example, for the propulsion of ships. During the past 2 years scientists and engineers of the Commission have been studying designs for nuclear reactors and conducting laboratory experiments to develop materials that will withstand the radioactivity, heat, and the corrosion encountered in reactor operation. This work includes studies of shielding and the design and operating characteristics of new types of reactors. The Commission has now reached the point where it must erect pilot models for field testing and development.

The testing and development of nuclear reactors under high level operating conditions requires a field station where such new type reactors could be built. Many of the same security, safety, and operating requirements that governed the selection of the Hanford site necessarily apply in the selection of the new field station; that is, it must have large areas, approximately 400,000 acres, of accessible yet isolated land, an adequate water supply and a minimum of valuable agricultural acreage or home sites. Avoidance of more than absolutely necessary displacement of persons from homes or income-producing property has also been considered. These basic requirements can be met only in the western part of the United States. The Commission staff in collaboration with the Department of Interior and the Corps of Engineers has made a thorough search of the United States for a site having the characteristics necessary for meeting the stringent requirements for such a station.

The two areas considered most desirable in the over-all survey were the Pocatello-Arco, Idaho, region and a region near Fort Peck, Mont.

Since the first of this year, the Commission has employed the engineering firm of Smith, Hinchman and Grylls of Detroit to make a detailed comparative evaluation of these locations.

The Pocatello-Arco area includes two sites, each of about 400,000 acres, one centered around the naval proving ground and the other adjoining to the southwest.

The Commission has concluded that the site centered around the naval proving ground is superior to either the adjoining site or the Fort Peck location. Consequently, the Commission has initiated discussions with the National Military Establishment intended to result in prompt acquisition of the land comprising the naval proving ground.

Sincerely yours,

UNITED STATES ATOMIC ENERGY COMMISSION.  
DAVID E. LILIENTHAL, *Chairman.*

---

UNITED STATES ATOMIC ENERGY COMMISSION

WASHINGTON 25, D. C.

(No. 162. Information for the press for immediate release)

AEC SELECTS IDAHO SITE FOR REACTOR TEST STATION

The United States Atomic Energy Commission today announced selection of an area in Idaho, including the naval proving grounds at Arco, as the best site for

a new national reactor testing station. Negotiations are under way with the Navy for the transfer of the proving grounds to the Commission.

After surveying a number of sites throughout the United States, the Commission has concluded that the most suitable location for its purpose is the area in the Snake River plains of Idaho including the 173,000-acre Navy proving grounds.

The total area of the new AEC facility will be about 400,000 acres. All but approximately 20,000 acres of the desired area near Arco is Government-owned land. The new reactor testing station will compare in area with the Hanford plutonium production center on the Columbia River in Washington.

The Commission has authorized its staff to negotiate with Navy officials for the transfer and has transmitted to representatives of the National Military Establishment a request for the property, which now is in inactive status. Engineering surveys are nearly complete, but detailed boundaries for the test area have not been fixed. Other surveys are continuing to determine the availability for housing, schools and other community facilities for personnel of the station.

Preliminary studies indicate that 75 to 100 persons reside near the perimeter of the site. The boundaries, however, are not definitely fixed and it is the policy of the Commission to establish the station with the least possible interference with any residents. (March 22, 1949.)

---

STATEMENT OF CONGRESSMAN MIKE MANSFIELD OF MEETING WITH MR. DAVID LILIENTHAL, CHAIRMAN, ATOMIC ENERGY COMMISSION, ON MARCH 22, 1949

At 11:40 a. m., Tuesday, March 22, 1949, I attended a meeting with Mr. Lilienthal's office in the building occupied by the Atomic Energy Commission. This meeting was attended by Governor Bonner, Senators Murray and Ecton, Congress Mansfield and D'Ewart, Gerald Skibbins, and James Sullivan; and the Atomic Energy Commission was represented by Mr. Lilienthal and Mr. Roger Warner, Chief Engineer of the AEC. Mr. Warner had also met with Senators Murray and Ecton, Mike Mansfield, and Gerald Skibbins on the preceding Tuesday, March 15.

Mr. Lilienthal stated, in response to a question, that the AEC had decided on March 1 that the Pocatello area, including the United States Navy's Arco Proving Grounds, was to be the location of the proposed atomic nuclear reactor plant. When I asked him why the congressional delegation from Montana had not been informed of this, he replied that he wanted to make the announcement but that the Navy had requested him not to do so. I asked him how long they had been working on the proposal of a new plant and he said 11 months. I told him that, in checking my files, the first word that I had about a proposal for a plant of this nature and the possibility of its being located in Montana was February 18, 1949.

I asked Mr. Lilienthal where the power for the proposed Pocatello plant would come from and Mr. Warner answered saying that the private power companies in the Pocatello region would expand, that power was now being furnished to the Arco Proving Grounds of the United States Navy by a private power line going from Butte and Salt Lake and that additional power would come from Anderson Dam in Idaho when completed. There are no plans to get any power from Montana for this Pocatello project except the small amount now going to the Arco Proving Grounds which, it is anticipated, will be continued.

We tried to induce Mr. Lilienthal to change his mind and to reconsider the possibilities of the Fort Peck-Glasgow area. We pointed out the many natural advantages which would accrue to such a location and assured him that the people of Montana and their Representatives in Congress and the State government would back a location for this area all the way. We pointed out that there would be sufficient power from Fort Peck to run the proposed plant.

Mr. Lilienthal informed us that there were two sites at Pocatello which were considered superior to the Fort Peck area. We asked him if these sites were not acquired would he then consider Fort Peck. He stated that they had every expectation of getting the first site they desired.

We left the meeting at 1:20 p. m., and this is my report to you of our conference with Mr. Lilienthal. Needless to say, I am keenly disappointed with the result.

HOUSE OF REPRESENTATIVES,  
*Washington, D. C., March 28, 1949.*

DEAR FRIEND: Because of the great amount of mail I have received on the proposed atomic energy plant for Montana, I am having Mr. David Lilienthal's letter to me—dated March 25 and just received—mimeographed and sent to all those who have written to me on the subject. This letter will, in many instances, follow up previous enclosures which have already been sent out.

With best personal wishes, I am,

Sincerely yours,

MIKE MANSFIELD.

(Accompanying the foregoing letter was a mimeographed copy of letter from David Lilienthal to Representative Mansfield, dated March 25, 1949, which is already a part of this record, on p. 7 herein.)

---

UNITED STATES ATOMIC ENERGY COMMISSION,  
*Washington, D. C., March 29, 1949.*

HON. MIKE MANSFIELD,  
*House Office Building, Washington, D. C.*

DEAR CONGRESSMAN MANSFIELD: At the meeting you attended with the Montana delegation at the Commission offices on March 22, certain questions relative to the AEC power requirements for the proposed reactor test station were discussed.

You will recall it was stated at that time that we plan to obtain the power from the station from generating equipment installed at the station and from the Idaho Power Co. which will be supported by the plants of the Bureau of Reclamation, either existing or under construction in the Snake River Basin of Idaho.

As you know, the Idaho Power Co. purchases some power from existing plants operated by the Bureau of Reclamation and by the Montana Power Co. Both the Idaho Power Co. and the Bureau of Reclamation have new plants and facilities under construction along the Snake River in Idaho which we believe will be adequate to meet our needs projected over the next several years.

I am further advised by my staff that we have not entered into negotiations with the Bonneville Administration for power for the test station. We do not plan to obtain power from the Hungry Horse project or from the Montana Power Co. Furthermore, we do not expect to require special transmission facilities to bring in out-of-State power to the test station.

Very truly yours,

UNITED STATES ATOMIC ENERGY COMMISSION,  
DAVID E. LILIENTHAL, *Chairman.*

---

HOUSE OF REPRESENTATIVES,  
*Washington, D. C., March 30, 1949.*

HON. BRIAN McMAHON,  
*Chairman, Senate-House Joint Atomic Energy Committee,*  
*United States Senate.*

DEAR MR. CHAIRMAN: We have received the following telegram from James J. Flaherty, president of the Montana Chamber of Commerce, Great Falls, Mont.: "Montana's labor, farmer, professional business and management groups are united in this appeal: We will not stand idly by while this State's water resources and the American people's tax dollars are squandered needlessly by the uneconomic location of the atomic laboratory in the Pocatello, Idaho, area. Our citizens and our representatives have been dealt a bust hand, off the bottom of a cold deck. Democrats and Republicans alike are up on their hind legs asking for another deal. Therefore, on behalf of all the people of Montana, would you assume personal responsibility for carrying this fight through to the finish? We respectfully suggest that you demand a fair hearing 2 weeks hence before the Senate-House Joint Atomic Energy Committee, in advance of their approval of funds for the atomic laboratory project. It would be fitting for Governor John Bonner to appear at this hearing along with technical experts of our choosing. If, by your determined effort, you are able to obtain a hearing of this kind before

the proper group, the weight of factual evidence in our hands all but guarantees that when the whole story is made clear the Fort Peck site will be chosen. The people of Montana will await your reply through public channels of communication. We are not asking for favors and our citizens are not on their knees. We are standing shoulder to shoulder as self-respecting Montanans who ask that you assume the leadership of this campaign and turn our last ditch stand into a victory.

"JAMES J. FLAHERTY,

*"President, Montana Chamber of Commerce."*

Mr. Chairman, we are sending Mr. Flaherty the following reply to the above communication:

"Reurtel. As always we will be more than happy to do all we can to see that Montana is still given every possible consideration as the site for the atomic nuclear reactor plant. We are today at your request asking Senator Brian McMahon, chairman of the Senate-House Joint Atomic Energy Committee for a hearing to take place 10 days to 2 weeks hence before the committee as you stated in your telegram, 'in advance of their approval of funds for the atomic laboratory project.' We are requesting at your suggestion that Governor Bonner be allowed to appear at this hearing along with technical experts of your choosing. We would also suggest that if we can arrange this meeting that you appear also. As soon as we hear from Senator McMahon we will let you know. In the meantime, please be assured that every member of the Montana delegation in the House and Senate has been 'doing everything in his power to help State of Montana receive this project. Regards.

"Senator JAMES E. MURRAY.

*"Congressman MIKE MANSFIELD."*

Mr. Chairman, we would personally appreciate your letting us know if it would be possible for your committee to schedule such a hearing within the next 2 weeks to hear the Governor of Montana and other individuals on the proposed atomic nuclear reactor plant now scheduled to be constructed in Idaho.

With best personal wishes, we are,

Sincerely yours,

MIKE MANSFIELD, M. C.

JAMES E. MURRAY.

WESLEY A. D'EWARD.

ZALES N. ECTON.

APRIL 4, 1949.

HON. DAVID LILIENTHAL,

*Chairman, Atomic Energy Commission,*

*Washington, D. C.*

DEAR MR. LILIENTHAL: Since the meeting of Governor Bonner and the entire Montana congressional delegation with you in your office on March 22, 1949, at which time you informed us that the Atomic Energy Commission had arrived at its decision to locate the proposed atomic nuclear reactor plant in the vicinity of Pocatello, Idaho, various statements have been released in the press which I think should be answered. I am therefore requesting that you answer insofar as you are capable of so doing the following statements:

1. Statement issued by Dr. Francis Thomson, president, Montana School of Mines, and Drs. Perry, Koch, and Nile, of the School of Mines faculty. (See copy of release issued by School of Mines to Associated Press and United Press on March 24, 1949, and newspaper articles on same statement in issues of Billings Gazette and Great Falls Tribune for March 25, 1949—both news articles enclosed.)

2. Statement by James Flaherty, president, Montana Chamber of Commerce, and carried in Billings Gazette on March 23, 1947, and other Montana papers on same date that:

(a) "Montana has been sold down the river in the selection of the site for the new national atomic research plant," and that—

(b) "if a political trade was made it was one of those 50-50 deals—1 horse and 1 rabbit—Montana winning the rabbit."

3. Mr. Gerald Skibbins said, according to the Billings Gazette, under date of March 26, 1949, that: "The final decision rests with the House-Senate Joint Atomic Energy Committee and the Congress, which must appropriate funds."

4. In the Billings Gazette for March 23, 1949, there appears this statement: "Flaherty said, \* \* \* We feel Montana was not represented at the hearing.

We feel sure when our Governor returns tomorrow he will give us the facts and will urge the Congress for a rehearing that Montana may present its case fairly."

5. In the same issue of the Gazette, March 23, 1949, the Glasgow Chamber of Commerce issued a statement which said: "We simply cannot understand why we were encouraged to go ahead, in view of the decision already made."

6. In the same issue of the Gazette, March 23, 1949, the statement issued by the Glasgow Chamber of Commerce stated: "We further believe that misinformation was given the Commission about the Glasgow-Fort Peck site by someone interested in something other than the best location for the atomic reactor station."

7. A story appeared in the United States News under date of April 1 that the latest site at Arco, Idaho, was selected, Montana interests were trying to get the new plant, and "Competing railroads also were active."

I would appreciate your returning the enclosures for my files.

Must close now but hoping to hear from you about these statements which I have called to your attention. With best personal wishes, I am,

Sincerely yours,

MIKE MANSFIELD.

P. S.—Would you also advise me by whose authority did the Commission act in the selection of the site for the plant and when this power was given to the Commission?

APRIL 5, 1949.

HON. DAVID LILIENTHAL,

*Chairman, Atomic Energy Commission, Washington, D. C.*

DEAR MR. LILIENTHAL: Since writing my letter to you on yesterday I have some more questions to ask about the proposed atomic laboratory. These questions are based on statements made in the Great Falls Tribune, Great Falls, Mont., under date of March 30, 1949. Will you please give me, as far as you are able, the answers to the six questions listed below?

1. Mr. Skibbins told a Kiwanis group here the proposed Fort Peck site for the laboratory would be more suitable, but the Atomic Energy Commission selected the Idaho location.

2. Arguing for the Fort Peck site, Mr. Skibbins said the 61,000 kilowatts necessary for the laboratory operation would be available immediately. Power at Pocatello would have to be brought in from some other major project, by use of transmission lines which would cost the Government huge sums, Skibbins added.

3. A deep-well water system which would cost about \$8,000,000 would have to be built at Pocatello while a small pump could be used to extract water from the Fort Peck reservoir, Mr. Skibbins said.

4. More skilled workers could be supplied by Montana, Mr. Skibbins declared.

5. About 90 percent of the required 400,000 acres of land needed for the laboratory is now owned by the Government at the Fort Peck site and the Glasgow Chamber of Commerce agreed to buy the rest of the needed land for the Government, Mr. Skibbins said.

6. The Navy owns 120,000 acres at Pocatello and the rest of the land would have to be bought from farmers in the area, Mr. Skibbins said. The Navy is not anxious to relinquish its hold on the firing-range land it holds, he added.

I would appreciate your returning the enclosed newspaper clippings with your answers.

Must close now but with best personal wishes, I am,

Sincerely yours,

MIKE MANSFIELD.

(The newspaper clipping referred to in the foregoing communication from Congressman Mansfield to Mr. Lilienthal from the Great Falls Tribune, dated March 30, 1949, is as follows:)

#### FAIR CONGRESSIONAL HEARING ASKED ON REACTOR STATION

HELENA, March 29.—A Montana Chamber of Commerce division consultant urges "a fair congressional hearing" before money is appropriated to set up an atomic reactor station at Pocatello, Idaho.

G. J. Skibbins, chamber industrial development division consultant, spent a week in Washington, D. C., trying to persuade the Government to locate the

multi-million-dollar plant at Fort Peck. He represented Gov. John W. Bonner, who also conferred in Washington.

1. Skibbins told a Kiwanis group here the proposed Fort Peck site for the laboratory would be more suitable, but the Atomic Energy Commission selected the Idaho location.

2. Arguing for the Fort Peck site, Skibbins said the 61,000 kilowatts necessary for the laboratory operation would be available immediately. Power at Pocatello would have to be brought in from some other major project, by use of transmission lines which would cost the Government huge sums, Skibbins added.

3. A deep-well water system which would cost about \$8,000,000 would have to be built at Pocatello while a small pump could be used to extract water from the Fort Peck Reservoir, Skibbins said.

4. More skilled workers could be supplied by Montana, Skibbins declared.

5. About 90 percent of the required 400,000 acres of land needed for the laboratory is now owned by the Government at the Fort Peck site and the Glasgow Chamber of Commerce agreed to buy the rest of the needed land for the Government, Skibbins said.

6. The Navy owns 120,000 acres at Pocatello and the rest of the land would have to be bought from farmers in the area, Skibbins said. The Navy is not anxious to relinquish its hold on the firing-range land it holds, he added.

---

UNITED STATES ATOMIC ENERGY COMMISSION,  
Washington 25, D. C., April 12, 1949.

HON. MIKE MANSFIELD,

*House Office Building, Washington 25, D. C.*

DEAR CONGRESSMAN MANSFIELD: Your letter of April 4, forwarding a series of statements released in the press, raises a number of questions about the Commission's decision to acquire a reactor site at Pocatello, Idaho. Since these statements show some misunderstanding, both of the purpose of the new site and the meaning of the decision, we wish to outline here the main steps taken by the Commission since April 1948, when it was first recognized that a testing station for experimental reactors was necessary.

The requirements for such a station demanded an isolated area of at least 400,000 acres to minimize potential hazards. At the same time it was desirable that the site be near enough to surrounding communities to make possible accommodations of personnel at this project site. Other requirements included access to a steady flow of water and to an adequate source of power.

In cooperation with representatives of other branches of the Government, skilled in this type of work, the Commission staff considered over 70 areas that might meet these requirements. By process of elimination, with more detailed examination at each stage, this number was reduced from 70 to 23, and then from 7 to 2—the Fort Peck, Mont., site and the area at Pocatello, Idaho.

The Commission employed the engineering firm of Smith, Hinchman & Grylls, Inc., to make a comparative evaluation of these two sites. In this final analysis before selection, the Commission staff and the engineering firm employed specialists in geology, hydrology, meteorology, and sociology and refined the requirements to include new criteria for isolation, security, climate, geology, nature of drainage and water supply, sources of manpower, availability of materials, town and community development, construction costs, types of transportation available, availability of electric power, and fuel sources. After the Commission had reviewed the findings of the firm of Smith, Hinchman & Grylls and had considered carefully the data that dealt with problems of health, physical protection, and drainage, in the light of its over-all requirements, it authorized its staff to begin discussions for the acquisition of the area near Pocatello which includes the naval proving grounds. These discussions are now under way.

Because of the misinterpretations that have been made of the announcement by the Commission that it had selected this site, the meaning of the decision should be made clear. This decision was, first, a finding that the Pocatello site was the preferred site and, second, a recommendation that negotiations to obtain the naval proving ground should be opened with the Navy Department. At the time of the decision, it was by no means certain that the Department would or could surrender the area that it was using as a proving ground. The public announcement of the Commission made clear that while the Pocatello site was to be preferred, negotiations for its acquisition were still under way.

This general statement on the background of the Commission's decision is a preliminary to answers to the specific questions raised by the statements in the body of your letter. We answer, first, however, your postscript in which you ask by what authority the Commission acted in the selection of the site and when the authority was given it. The authority of the Commission to acquire land is based on the provisions of the Atomic Energy Act of 1946, particularly section 12 (a) (7) of the act, authorizing the acquisition of property. Its authority is further based on the language of its basic appropriation act for 1949, authorizing the purchase of land and interests in land.

In the following paragraphs, we comment on the seven statements you include in your letter.

1. Dr. Thomson suggests, in a reported statement, that the Missouri River would appear to be just as suitable to receive radioactive wastes as the Snake River. The Commission proposes to isolate, reduce, and store the radioactive wastes under inventory and, therefore, will not utilize a river in its waste disposal. In the remote possibility of accident, the porous soils of the Pocatello area offer better protection than the more impervious soils of Fort Peck, Mont. Considerations of such a possibility indicated that areas such as the one near Fort Peck, Mont., which consists of moderately impervious soils and is subject to rapid run-offs, are not so desirable as areas such as those northwest of Pocatello, which consists of porous soils with no surface drainage to the Snake River. It has been estimated by geology and hydrology specialists that radioactive material deposited on the Snake River plains near Arco would require more than 100 years to percolate downward 200 feet or more to the water table and pass through it to the Snake River. During this interval, a great deal of the material would be absorbed by the soils, diluted by the underground water flow, or lose its potency by radioactive decay.

2. James Flaherty, president of the Montana Chamber of Commerce, declared that the State of Montana had been "sold down the river" in the choice of the site. We have already pointed out that the survey was impartial, that it was made by independent agencies, as well as by the Commission, and that the decision was reached only after exhaustive analysis.

3. Mr. Gerald Skibbins was quoted as stating that the final decision rested with the Joint Committee on Atomic Energy and the Appropriations Committees of the Congress. It is, of course, true that Congress must appropriate the money needed for acquisition and development of the testing station. As stated above, however, the Commission has been granted authority by the Congress to acquire land as provided in the Atomic Energy Act of 1946 and in its appropriation for 1949. In this connection, a press release from the Joint Committee on Atomic Energy, dated April 5, reported Senator McMahon, chairman of the committee, as stating that "The joint committee does not believe it to be within its province to choose the site but only to ascertain whether or not due care has been used by the Atomic Energy Commission in making the site selection."

4. Mr. Flaherty was quoted in the Billings Gazette of March 23, 1949, as stating that Montana was not represented at "the hearing." Mr. Flaherty, presumably, refers to a meeting between the Commission and the Joint Committee on Atomic Energy. This meeting was called at the request of the joint committee. It was an executive session at which the Atomic Energy Commission informed the joint committee of the selection of a reactor site, in keeping with the provisions of the Atomic Energy Act that the Commission shall keep the joint committee fully and currently informed with respect to the Commission's activities.

5. In the same issue of the Gazette is the statement that "We simply cannot understand why we were encouraged to go ahead, in view of the decision already made." We have already indicated above the background and the nature of the Commission's decision. It was a finding that the qualifications of the Pocatello site best fulfilled the requirements for a test station, and a recommendation that discussions be initiated with the Navy Department directed toward its acquisition. Between the time of the decision and the date of the public announcement, negotiations with the Navy were started. The Montana congressional delegation met with representatives of the Commission and was notified that the Commission had selected a site in Idaho that met its requirements, and that negotiations to acquire it had commenced. Although the Commission will make every effort to obtain the Idaho site, it is still not entirely clear that this site will in fact be released to the Commission.

6. A statement in the same issue of the Gazette declares that the Commission was given misinformation about the Fort Peck site by "someone interested in something other than the best location" for the atomic reactor site. The impartial, detailed, and professional nature of the surveys conducted by private and Government agencies best qualified for this work has been indicated above.

7. The issue of the United States News of April 1 is quoted to the effect that in this site selection "competing railroads also were active." We know of no activity on the part of "competing railroads" that had any bearing on the choice of the site by the Commission. Without further explanation than is given in this article, the meaning of this statement is not sufficiently clear to make additional comment possible.

We will comment on the further statements forwarded in your letter of April 5 as soon as possible.

Sincerely yours,

UNITED STATES ATOMIC ENERGY COMMISSION,  
DAVID E. LILIENTHAL, *Chairman.*

UNITED STATES ATOMIC ENERGY COMMISSION,  
*Washington, April 13, 1949.*

HON. MIKE MANSFIELD,  
*House Office Building, Washington 25; D. C.*

DEAR CONGRESSMAN MANSFIELD: This is in reply to your letter of April 5 forwarding questions based on statements made in the Great Falls Tribune, Great Falls, Mont., dated March 30, 1949. Our comments on these statements should be considered in relation to the material included in our previous letter to you dated April 12.

1. Mr. Skibbins was reported to have told a Kiwanis group that Fort Peck, Mont., site for the laboratory was more suitable, but that the Commission selected the Idaho location.

To the extent that this is a representation of the Commission's judgment rather than that of Mr. Skibbins, this statement is incorrect. After an examination of detailed surveys and analyses it was the judgment of the Commission that the Pocatello, Idaho, location was better suited to the Commission's needs than the Montana site.

2. Mr. Skibbins was reported to have stated that: "The 61,000 kilowatts necessary for the laboratory operation would be available immediately. Power at Pocatello would have to be brought in from some other major project, by use of transmission lines which would cost the Government huge sums."

According to the present plans it is estimated that the power load for the reactor testing station, including requirements for processing, construction camp, and permanent housing, will be in the order of about 70,000 kilowatts. During the early years the total requirement is nominal. It increases at such a slow rate that by 1953 it is now estimated that not more than 20,000 kilowatts will be needed for all purposes.

In considering the qualifications for Fort Peck the Department of Interior indicated that our requirements could be satisfied during the next 5 years without additional generating capacity. The Department also indicated that power could be supplied from western Montana or by additional capacity installed at the Fort Peck Dam.

We are informed that enough power is presently available for the Pocatello site to handle the requirements during the preliminary construction phase. A transmission line is under construction along the Snake River which will hook up the many generating facilities operated by Idaho Power Co. It is contemplated that the capacity thus generated and distributed will adequately serve the reactor testing station after 1950. Thus as we stated in our letter of March 29, power for this project could be supplied from within the State of Idaho.

It is not planned to install any extensive transmission line other than what is required to obtain power from the new line along the Snake River, which will run about 25 miles in length.

In connection with the cost of power at the two sites, the Department of Interior is proposing a uniform rate for power in the Missouri River Valley and in the Northwest power pool, and according to this proposal the cost of generating and distributing power from Fort Peck will be about 5.5 mills per kilowatt-hour. Our surveys show that in the Upper Snake River where power generation plants are larger and less costly, transmission lines are shorter. The costs there are

expected to run at about 3.5 mills per kilowatt-hour. Assuming a consumption of 400,000,000 kilowatt-hours per year, the total annual cost at Fort Peck amounts to \$2,200,000 and at Pocatello amounts to \$1,400,000.

3. Mr. Skibbins is reported to have said that: "A deep-well water system which would cost about \$8,000,000 would have to be built at Pocatello while a small pump could be used to extract water from the Fort Peck reservoir."

Present estimates of the cost of a system for obtaining and distributing water at the Fort Peck and Pocatello sites, which were made by Smith, Hinchman & Grylls, indicated that approximately \$10,000,000 would be required at either site. Furthermore, we were informed by the Bureau of Reclamation that there might be an operating charge for the surface water impounded behind the Fort Peck Dam.

4. Mr. Skibbins is reported to have declared that more skilled workers could be supplied at the Montana site than at the Idaho site.

The surveys conducted for the Commission by Smith, Hinchman & Grylls indicated that in 1948 the construction workers within a 200-mile radius at the Montana site numbered about 25 percent of those in an equal area at the Idaho site, although there was a shortage at each site.

5. Mr. Skibbins further declared that 90 percent of the required 400,000 acres of land at Fort Peck is now owned by the Government and that the Glasgow Chamber of Commerce agreed to buy the rest of the Government. This estimate of that proportion of Government land at Fort Peck, cited by Mr. Skibbins, is the same as that presented by the surveys of the Commission.

6. Mr. Skibbins stated that the Navy owns 120,000 acres at Pocatello and that the rest (280,000 acres) would have to be bought from the farmers in the area. He further stated that the Navy is not anxious to relinquish its hold on the firing range land it now holds.

The proportion of Government-owned and non-Government-owned lands at Pocatello as stated by Mr. Skibbins is incorrect. We are advised that the Federal Government presently holds about 93 percent of the land at the Pocatello site. About 4 percent is privately owned. The remainder is State property. Negotiations with the Navy for the transfer of this land are in progress.

In conclusion, we would like to refer again to the detailed, impartial, and professional nature of the surveys which were conducted in connection with the choice of a site for the reactor testing station. The sole interest of the Commission was to obtain the site best suited to the requirements of its program.

Sincerely yours,

UNITED STATES ATOMIC ENERGY COMMISSION,  
DAVID E. LILIENTHAL, *Chairman*.

The CHAIRMAN. Are there any more questions?

Senator Tydings?

Senator TYDINGS. I would like to ask if all of the press in Montana support the point of view which you have expressed.

Representative MANSFIELD. Yes, sir.

Senator MURRAY. Mr. Chairman, I wish to add that I am in full accord with everything that Congressman Mansfield has just stated. We were very active as soon as we learned about this matter, and we had several conferences with the Atomic Energy Commission in an effort to understand the situation and present to the Commission some facts that we thought they might not have given due consideration to in determining the location of this site. I still feel as Congressman Mansfield does, that the site in Montana would be the more favorable site to be selected for this purpose. It is an isolated tract, and I think that we have all of the conditions there which are necessary for operation of this plant in Montana with full safety and security.

Representative PRICE. Mr. Chairman?

The CHAIRMAN. Mr. Price.

Representative PRICE. As to the summary which the chairman placed in the record at the outset of the hearing, in the comparison of the factors on electric power both Fort Peck and Pocatello are rated the same.

Do you know what the source of power at Fort Peck-Glasgow is?

Representative MANSFIELD. It is the Fort Peck project.

I will say to the gentleman from Illinois that that project, which was built during the depression days, generates at the present time, I believe, somewhere around 70,000 kilowatts, but it will, with an additional generator, be able to generate in excess of 100,000 kilowatts of power. It is my understanding that the most power which this new site would need would be in the vicinity of 70,000 kilowatts.

It is my further understanding that insofar as the Pocatello site is concerned, they would very likely in the beginning have to use a few Diesels, and Idaho Power & Light will have to expand its facilities. Furthermore, they are anticipating power from the Anderson Ranch Dam in southwest Idaho, when that is completed.

Representative PRICE. That is all I have, Mr. Chairman.

Senator HICKENLOOPER. Mr. Chairman?

The CHAIRMAN. Senator Hickenlooper.

Senator HICKENLOOPER. Mr. Mansfield, you say that you have not had an opportunity to go through the report of Smith, Hinchman & Grylls, Inc.

Representative MANSFIELD. Yes, sir. I saw it last night for the first time, and I just had a chance to glance over a very few pages, and was not able to go into it in any detail whatsoever.

Senator HICKENLOOPER. Have any representatives of yours had an opportunity to go through that report in any detail?

Representative MANSFIELD. It is my impression that Mr. Skibbins, consultant to the Montana Chamber of Commerce, requested Senator Murray to try and get hold of that report, so that he could have a chance to study it and answer any arguments which he thought were not correct.

Senator HICKENLOOPER. I make that suggestion because if there are facts in the record which would dispute this selection of site, I think they would be pertinent. With the kindest feeling, I can understand your zeal for acquisition of utilities in your own State, but I just wanted to submit to you that State pride in a location for a project would hardly be sufficient to overturn scientific investigation and finding. I do not mean to say that you do not have more than that, but I am just wondering if your delegation is prepared to call attention to findings which you dispute, backed up by facts which would indicate that the Fort Peck site is in fact a better site.

In other words, I think you probably understand that this committee, whatever lack of authority you may have in determining these things, still would be interested in the best over-all site for this project.

Representative MANSFIELD. May I say to the gentleman from Iowa, who always has had the kindest feelings toward me personally, which, I want to assure him, are reciprocated, that if we got down to a choice of either Pocatello or Fort Peck, it is our conviction that we have a great deal in our favor. And it is my hope that those gentlemen who have had a chance to go into this report in detail will be able this morning to justify the position we are taking before this committee.

Senator HICKENLOOPER. I suppose I should apologize for even posing this in the nature of a question, but I should assume that if

impartial examination of these two sites did show that Pocatello had an advantage to the Government, and to the project over the Fort Peck site, that probably would be the site we would have to support: the one that would be the most advantageous. Therefore, I ask the question, if there are specific items of dispute in which your delegation believes that it can show that this report is wrong. If you have others here who could do that, I would personally be interested in hearing them.

May I ask one other question?

Is the only report that you have seen on this matter the report of Smith, Hinchman & Grylls, Inc.?

Representative MANSFIELD. Yes, sir.

Senator HICKENLOOPER. Have you seen any other surveys or reports that have been conducted in regard to the Fort Peck site?

Representative MANSFIELD. No, sir; although I did hear in this meeting in Senator Murray's office last night, with the Montana delegation, that there was a report put out by General Pick of the engineers, about which I know nothing, and which I heard of for the first time at that meeting last evening.

Senator HICKENLOOPER. Do you know whether an attempt has been made to get that report?

Representative MANSFIELD. Senator Murray, I understand, has been bending every effort to get that report, so that it can be gone into.

Senator HICKENLOOPER. I think that is all.

Representative MANSFIELD. May I say one more word?

Senator Tydings asked me if the Montana press was behind this question. I said "yes," emphatically. I want to add to that that there is not one person in the State of Montana that I know of who is against this proposition. We are all united, and we all want it.

The CHAIRMAN. Well, that does not come as any great surprise to me.

Representative PRICE. Mr. Chairman, may I say something?

The last hearing I sat in, there was a community that did not want any part of anything like this.

Representative MANSFIELD. We are different.

Representative DURHAM. When was this report first made available to the Senator's office?

Representative MANSFIELD. I believe it was either yesterday or the day before that this report was made available from this Detroit concern to your office, Senator Murray.

Senator MURRAY. We got it just a couple of days ago, and we turned it over to Mr. Skibbins as soon as we had the opportunity.

Representative DURHAM. When did you request this report? When was the report requested?

Senator MURRAY. About a week ago, I guess. We got it promptly. We did not get the engineers' report, because that is confidential, and they were trying to have it reclassified so that it could be made available to us.

Representative MANSFIELD. That is the Army engineers?

Senator MURRAY. Yes. That report was made to the Secretary of the Army, and therefore we had to work through that channel in order to get access to it.

Representative DURHAM. I just wanted to be sure that the report was made available.

Senator HICKENLOOPER. I would like to ask Senator Murray if he has any opinion as to what the Army engineers' report concluded, that he can express at this time.

Senator MURRAY. I think their report is purely factual and does not make any determination of the issues.

Of course, I understand that the Army has expressed itself to other agencies of the Government with reference to the conditions in both sites.

The CHAIRMAN. Mr. Mansfield, thank you very much indeed. We were glad to see you, and we are glad you have had an opportunity to state your views.

Representative MANSFIELD. I want you to know that we appreciate the opportunity to state our views, too.

Mr. LOBLE. May I introduce the Governor of the State of Montana, John Bonner, who is here on this mission to present, on behalf of the State of Montana, our position.

#### STATEMENT OF HON. JOHN W. BONNER, GOVERNOR OF THE STATE OF MONTANA

Governor BONNER. Mr. Chairman and gentlemen of the committee: I want to thank you for the courtesy of permitting us to appear here. I know that you are all busy. But we consider this a matter of vital moment not only to the people of Montana, but to the United States as well.

To begin let me say that we do not approach this matter from the standpoint of selfish interest at all. We bear in mind at all times the security of the people of the United States and the welfare of all the people of the United States. But at the same time we feel—and I express the opinion of all the people of Montana—that due consideration was not given to Montana in the selection of this particular site.

I was interested in the question asked by a member of the committee as to the engineers' report. I am referring now to those from Detroit. We have gone into that. And permit me to say also that this is my second trip to Washington in regard to this project. I was here approximately 2 weeks ago.

A question was asked as to the engineers' idea as to the site, and I can only answer this: I have not had access to the engineers' report, but I did talk with General Pick, Chief of the Army Engineers, who is very familiar with the waters of the United States, and particularly those in the West. And he told me that in his opinion the Fort Peck site was the site that should be taken.

The CHAIRMAN. Who told you this?

Governor BONNER. General Pick, Chief of the Army Engineers. And he told me further that he felt we were on the right track, and that we were entitled to it.

I might say also that this was my first visit with General Pick. I had never met the General before.

We are here not just in loyalty to the State of Montana; we are here because we believe that Montana has the better site for this atomic plant at Fort Peck. The people of Montana feel that way also.

We do not just base that opinion on loyalty to the State. Mr. Skibbins, who is here today, has been working on this for a consider-

able period of time, and we have had others making an investigation as far as this plant is concerned.

I know that the committee is busy, but we could go on to tell you about Fort Peck, the power that is available there, the lands that will be donated free to the United States of America, the saving to the people of the United States of America in freight rates if the plant is located at Fort Peck.

In regard to the press of the State of Montana, it is behind this project. And let me tell you further that I happen to be a native of my State, and I do not believe, in my lifetime, at least, I have ever observed such a united front for a project as we have in this instant case. It is not just one particular group. And, as you know, I need not tell you that our State, our people, are always mindful of the security of the United States. They do not think that they know everything in the world, but they do feel that in this particular instance due consideration was not given to the State of Montana.

I am not going to argue the social factors here today—that is one thing that was put in there—or the climate. I know that when the name "Montana" is mentioned to a lot of people, they think of it as a land of snow. But I think if you investigate the climatic conditions of last winter, you will find Montana, as far as the Western States are concerned, in the best position. You will find, I think, that in and about Pocatello they were snowbound, while our roads were open.

Permit me to say further that we are closer to Washington, D. C., than is Pocatello, Idaho. And while I do not claim to be a military expert, nevertheless I know that as far as atomic energy is concerned, from the standpoint of a defense proposition, there can be no reason why these plants should be laid out in one grid as required by the situation at Pocatello, rather than being scattered, as would be the case at Fort Peck.

That is something that should be considered from the standpoint of the security of the United States. For example, in the case of the projects like Hanford, and as would be the case in Pocatello and that area, if you had some disaster occur in war, they could be destroyed by the enemy; or if you should have an earthquake there, you have lost your whole group of defenses.

On the other hand, if you have them scattered, as would be the case at Fort Peck, the chances, in either case, would be much better.

Mr. Chairman, and gentlemen of the committee, that is all I have to offer. We do have Mr. Skibbins here, and he will have some facts to present to you.

We sincerely believe—or would not be here—that on the record and on the facts we have a preferable site to that of Pocatello, Idaho.

Thank you, Mr. Chairman.

The CHAIRMAN. Governor, speaking about location, I remember a hearing that I attended about a year ago when Mr. Martin of the Glenn L. Martin Aircraft Corp. was here. Senator Reed of Kansas suggested it might be better if he moved his plant from Baltimore to his State of Kansas, because it would be less vulnerable to enemy attack. Mr. Martin replied that if you take a look at the map, not a mercator projection map but a polar projection air map, you find that if you put the plant in Kansas it would be closer to probable attack than where located in Baltimore.

So as far as the exact location is concerned, I do not think there is much choice from a defense standpoint.

Governor BONNER. Well, I may be in error, and if I am you should correct me; but I think this very committee said it would be within 24 hours of Chicago.

The CHAIRMAN. By rail?

Governor BONNER. By rail.

The CHAIRMAN. Of course, either one of them would be.

Governor BONNER. Montana is closer.

The CHAIRMAN. What is Montana, by rail?

Mr. LOBLE. On the main line of the Great Northern it is much less from Glasgow to Chicago. I understood it was 24 hours from eastern industrial centers, and that is true. That is the fastest western line, the Great Northern.

Of course, we have other lines; but that is right on the main line.

The CHAIRMAN. How much difference is there?

Mr. LOBLE. I think it is substantial. I understand Arco is on a branch line that they cannot even haul cattle on, on account of the condition of the line. The branch line runs finally to the main line. It is much quicker from Glasgow on a straight run to the East than it is from any other place.

Governor BONNER. That is one of the things that we were interested in, Mr. Chairman, in connection with those different facts given by the Commission, you see.

The CHAIRMAN. I want to thank you very much, Governor. I am glad you came along to tell us about it.

Representative COLE. May I inquire, Mr. Chairman, in view of the fact that the Governor has said that the Chief of the Army Engineers has expressed a preference for the Fort Peck site, if his group intends to have General Pick come down to express his viewpoint.

Governor BONNER. We are trying to get the general; and I will try again. I would like to have him here.

Representative COLE. Governor, you also made reference to the fact that there would be ample available free land for this site. Does that mean that all of the land which the Commission would feel would be necessary for the site would be free to the Government?

Governor BONNER. That is my information, yes. And I do not know whether you have been there, but I might say also that Glasgow is a very fine town and community, and would have all the facilities, to begin with.

Of course, I realize that regardless of what site was selected, you would have to have more buildings.

The CHAIRMAN. Any other questions, gentlemen?

Senator ECTON, you and Mr. Mansfield may feel free to ask questions if you wish.

Senator ECTON. Not at this time, Mr. Chairman. But as a member of the Montana delegation, I certainly want to express my appreciation to you and to your committee for providing the opportunity for the Montana Governor and the other representatives from our State to have this hearing.

I think you are acquainted with the fact that a couple of weeks ago Mr. Lilienthal informed all of us that due to the process of elimination, on scientific evidence collected over the past 12 months, the

Atomic Energy Commission had decided on the Idaho site. We informed Chairman Lilienthal, I believe, at that time, that Montanans were a persistent group of people, and that we hated to be nosed out in the race when we were apparently so close to winning it.

We appreciate very much the fact that you and your committee are taking time off from a very busy session and from your numerous duties to give us this opportunity to present our case to you.

The CHAIRMAN. Thank you very much, Senator.

Mr. LOBLE. Mr. Chairman, the next witness is our principal witness, Mr. Skibbins.

I might say, before I call him, that the earthquakes that occurred in Idaho and in Washington yesterday were purely a coincidence in reference to this hearing; they were not by prearrangement.

The CHAIRMAN. There is no damage, however, at Hanford, I understand.

Senator HICKENLOOPER. You are absolutely certain that the heat generated by this hearing did not contribute to the earthquakes?

Mr. LOBLE. I am not certain of that, Senator. We live in an earthquake country, which we have now transferred over to Hanford and Bonneville and over to Washington.

Mr. G. J. Skibbins is an industrial engineer of the Montana Chamber of Commerce. He was a pilot in the last war, and received the Purple Heart. That is not of very great importance here, but I mention it because we are very proud of him in Montana. He has worked intensely, day and night, on this matter for us.

What he is going to present is factual in nature. He has examined the report of Smith, Hinchman & Grylls, Inc., which we think is entirely erroneous. There are many so-called factual matters in there that we know are not factual matters.

The CHAIRMAN. I have asked Mr. Loble to go ahead and testify, and then submit whatever information and exhibits he wishes to submit later, which I understand is your procedure.

Mr. Skibbins?

**STATEMENT OF G. J. SKIBBINS, INDUSTRIAL CONSULTANT,  
MONTANA CHAMBER OF COMMERCE, HELENA, MONT.**

Mr. SKIBBINS. Mr. Chairman and gentlemen, I would like to say that everything I am going to say to you here today I believe is the absolute truth.

You gentlemen are concerned entirely with the manner of procedure in arriving at this decision, and not in anything else, although you realize that the people of Montana think that this is a fine project.

I will confine my remarks to the point, namely: How is the decision arrived at? Is there an evidence that was used to make this decision that is erroneous? Or is there complementary evidence which can be introduced at this time which would indicate that a reevaluation might be necessary?

I might say, because of the fact that we have gathered so much evidence, and because it all points in exactly one direction, that that is the maddest bunch of polecats that we ever saw out there in Montana, and everyone is very, very much stirred up.

Well, let's get down to cases.

On the subject of land cost, the Smith, Hinchman & Grylls, Inc., report indicates costs of \$1,500,000 in the Pocatello area. At the Fort Peck site they have indicated in their maps, there, a block of 400,000 acres, but in the manner in which that block was made, a large amount of private land was included. That block can be reanalyzed and can be arranged in a different pattern to include, instead of 400,000, a steady large square block of 457,000 acres, the ownership of which is 95 percent Government land, and 5 percent private land, and not 83 percent Government land as indicated in the Smith, Hinchman & Grylls, Inc., report.

Of the 5 percent private land, there are 30 folks down there who inherited the land from their grandfathers, and maybe they throw a few cows or some sheep out in that area, and it is not good for much else. There is to our knowledge not a soul living in that area of 457,000 acres. The private land is guaranteed to you by the Glasgow Industrial Committee, which will buy it up, because it isn't worth much anyhow, and they will turn it over to the Atomic Energy Commission.

In other words, instead of the item in the Smith, Hinchman & Grylls report, indicating a cost of \$1,500,000 for land at Fort Peck, the cost is zero. And there is a saving of \$1,400,000 if the plant were located at Fort Peck, because that is the cost they list at Pocatello.

I am going to switch very fast, here, to one subject after another.

As will be testified later by a competent authority in freight rates, whose testimony is to my mind almost beyond question, the savings in freight rates are going to run to \$20,000,000 at this site. That is a lot of money. You will also find, as we cite the testimony of the Smith, Hinchman & Grylls report, that they show a 5-percent advantage for freight coming into the Arco area.

Now, it is incomprehensible why competent railroad authorities were not consulted to decide exactly what this freight advantage would be.

I am submitting as part of my testimony an analysis prepared by the Board of Railroad Commissioners of the State of Montana, an analysis of class rates going into Pocatello and to Glasgow from the logical industrial points in the East, from which the equipment that will be used there will be shipped, and it shows advantages up to 52 percent, with the bulk of them lying between 20 and 30 percent. That means that in a large freight bill there is going to be an awful lot of money involved on this point.

(The statement referred to is as follows:)

STATEMENT OF H. ROBERT GUSTINE, ASSISTANT RATE CLERK FOR THE BOARD OF  
RAILROAD COMMISSIONERS, STATE OF MONTANA

There are attached exhibits A, B, and C, showing class rates from Eastern Trunk Line, Central Freight Association, and Western Trunk Line territories to Pocatello, Idaho, and Nashua, Mont. (railhead for Fort Peck, Mont.).

Exhibit A is a statement showing class rates in cents per 100 pounds from Eastern Trunk Line, Central Freight Association, and Western Trunk Line territories to Nashua, Mont. This statement shows the base rates and also those rates as increased under the *ex parte* increases. The increased rates are also subject to an additional 5-percent increase, with the exception of the rates from St. Paul, Minn., which are subject to a 4-percent increase, under authority granted in *ex parte* 168.

Exhibit B is a statement showing class rates in cents per 100 pounds from Eastern Trunk Line, Central Freight Association, and Western Trunk Line territories to Pocatello, Idaho. This statement shows the base rates and also those rates as increased under the ex parte increases. The increased rates are also subject to an additional 5-percent increase, with the exception of the rates from St. Paul, Minn., which are subject to a 4-percent increase, under authority granted in ex parte 168.

Exhibit C is a statement showing class rates in cents per 100 pounds from Eastern Trunk Line, Central Freight Association, and Western Trunk Line territories to Pocatello, Idaho, and Nashua, Mont.

It also shows the percentage of decrease in rates to Nashua under Pocatello. The percentage of decrease to Nashua varies from a high of 52 percent from St. Paul to a low of 8 percent from Milwaukee, Wis. This exhibit shows that a considerable amount of freight revenue can be saved in shipping to Nashua, Mont., instead of Pocatello, Idaho.

In all of the exhibits the class rates shown are first, fifth, and class A to E, inclusive.

The rates fifth class and lower would apply to all carload commodities.

EXHIBIT A.—Statement showing class rates in cents per 100 pounds from Eastern Trunk Line, Central Freight Association, and Western Trunk Line Territories to Nashua, Mont.

#### AFFIDAVIT OF H. R. GUSTINE

STATE OF MONTANA,

County of Lewis and Clark, ss.:

I, H. Robert Gustine, do hereby certify that I have prepared the foregoing exhibits A, B, and C, and that the rates shown thereon as taken from the Transcontinental Freight Tariff Bureau, Tariff No. 57-B, Central Freight Association, Tariff No. 491-D, and the Trunk Line Tariff Bureau, Tariff No. 107-C, and L. E. Kipp's Tariff of Increased Rates and Charges, all of which are approved and legally on file with the Interstate Commerce Commission, Washington, D. C., the same showing the differential of rates from Eastern Trunk Line, Central Freight Association, and Western Trunk Line Territories to Pocatello, Idaho, and from the same points to Nashua, Mont., are true and correct to the best of my knowledge and belief.

H. ROBERT GUSTINE.

Subscribed and sworn to before me this 11th day of April 1949.

[SEAL]

H. L. GUSTINE,

Notary Public for the State of Montana, residing at Helena, Mont.

My commission expires February 3, 1952.

Mr. SKIBBINS. An unusual factor in fuel costs at the Fort Peck area has been completely overlooked, although it was brought to the attention of the organization by competent people in Montana when this survey was being made. That factor is this: When they were building the Garrison Dam, they uncovered a heavy coal seam and got 5,000,000 tons of mighty good coal in that area, which they have learned how to store to last a good many years. It will not slack in a few days or a few months. That 5,000,000 tons cannot go into the normal channels of trade and supply, because it will put all the coal operators out of business in North Dakota.

The folks out there are very much interested in it. The Government doesn't know what to do with it. And it is extremely peculiar that that 5,000,000 tons was not mentioned as the source of fuel for the project, which it would be if an interest were displayed in the

Fort Peck area. Presumably that 5,000,000 tons would merely be turned over to the Atomic Energy Commission at Fort Peck. The cost and freight has been estimated by the two railroads concerned, in advance of any definite final decision, as from \$2.90 to \$3 per ton to deliver it from Garrison to Fort Peck.

This means that the 500-ton-a-day requirement of this particular B. t. u. coal, 7,000 B. t. u. coal, could be laid into Fort Peck at a cost of \$1,500 a day.

Now, the very best and most favorable estimate on Pocatello goes up to \$2,000 a day. That means \$500 a day saved on fuel.

I am also reliably informed by Montana sources and coal operators that other mines could deliver their coal at Fort Peck—but were not asked for a rate on it—at never more than half the per ton cost or per B. t. u. cost at Pocatello. Annual fuel savings of \$182,500 every year that this plan is in operation, may be made on this single item, because of the fact that the entire eastern half of Montana and a good section of North and South Dakota are underlaid with coal.

On the subject of housing, there is no way for the Commission—although it would very much like to, and it is not to be blamed—to completely avoid responsibility for housing and community facilities, except with the wholehearted cooperation of the community involved. On the subject of housing, we have gotten together the Montana Contractors Association, Glasgow contractors and banks, and a group of Spokane, Wash., mortgage and building companies, who have urged most strongly their ability to construct for the Atomic Energy Commission, using their own funds and the sources known to them, a 500 or more home subdivision for the city of Glasgow, which will be available to the people working at the AEC installation on a rental and not on a purchase basis.

A great deal has been done on this housing problem. I notice that releases regarding Arco say that the local communities are expected to absorb the housing. We are making a definite offer that the people who are responsible for housing in Montana and in the Northwest will build for rental as many houses as are required in the Fort Peck area. The land is owned by the city. It does not have the situation that you have in Arco where land was worth \$100 and \$1,900 the next day for the same lot. This land is going to be turned over by the city at a very, very low rate, which is the way the job should be done. Because we do not believe in wildcatting of that kind in Montana.

On the subject of employment, screening, and labor turn-over costs, in Montana the Unemployment Compensation Commission has set aside the sum of \$60,000 to construct an employment office at the AEC site in the Fort Peck area. In addition, the Commission will allocate funds from its annual budget to completely staff this office with trained labor recruiters who can screen and produce all of the applicants required for AEC positions, in construction and in permanent operation.

I won't go through the entire subject here, other than to say that the chairman of the commission has surveyed every office in the State, and in the last 3 months they have found that they can guarantee 10,000 men for this project, all of them from the State of Montana; and over and above that is your drifting and transient labor, which has caused so much difficulty in most of the construction projects in the Northwest.

The Commission is able to screen and take care of the whole job of employment in that area, it feels, because there are so many Montana people who require work. There is a situation there where you have 4,500 veterans who were on unemployment-compensation rolls last month, and who can only expect seasonal employment. And those are the fellows that I had the privilege of fighting alongside of in this war. That situation is apparent to us.

We had 12,000 unemployed last month. We are deeply concerned about the fact. The people who know something about labor in Montana say that we can provide the type of labor that is not going to be leaving every few days, and is not going to be switching from job to job. I understand that the turn-over costs within the Commission are \$350 per person, and we feel that that factor should be considered very carefully; especially when we know that the labor will stay there, because we are going to give them the houses. And they are not going to stay in any other area unless those houses are provided.

There are several other costs that are interesting.

Let us take the matter of fencing. At Pocatello there is the necessity for constructing utility posts, security fences, and an overhead steam-transmission line, according to the Smith, Hinchman & Grylls report. This will have to be slow digging in hard lava. At Fort Peck there is no such expensive rock work for this purpose. According to the Detroit engineers' estimates, the savings in fencing costs for the security fence would run to half a million dollars, and the other requirements for rock work in transmission lines and overhead piping would conservatively be estimated as an over-all total of \$1,500,000.

On the subject of water costs, we find one of the most interesting situations. The only reason Fort Peck does not show a really tremendous advantage in costs of water from the 175-mile-long Fort Peck Reservoir is that the Smith, Hinchman & Grylls report indicates that they have received word of a charge of from 1 to 15 cents per thousand gallons of this water out at the reservoir. In its high ranges, this charge would be higher than that for drinking water in most cities of Montana. Discussions with officials of the Missouri Interagency Committee and the Corps of Engineers and the people working at Fort Peck who are in charge of its operation reveal that they have no knowledge of any law or any regulation now enacted by which they could justify this charge. The practice in Montana is to file at the county courthouse for water, and then, if no other user is hurt, receive the water free.

In southeastern Montana, our considerable investigations of the synthetic-fuel proposition have revealed that the procedure for obtaining quantities of water is to merely file in your county courthouse. And, if there is one thing that the State of Montana is left with, it is plenty of chasers for a good drink. And yet this reported cost of 1 to 15 cents per thousand gallons comes out of the Department of Interior, to completely prejudice the costs of steam and of water in this Smith, Hinchman & Grylls report.

A bookkeeping charge of this kind between agencies of the Government for water which will return to the stream and be reused, in my opinion cannot be justified. This item should be eliminated. It represents a cost figure of \$3,050 per day against the Montana

site, and, along with electric-power cost mistakes, forms the main argument for the Pocatello claim of favorable operating costs.

The annual amount of this water cost against the Montana site is \$1,113,250.

Items such as these, thrown into what is represented as a technical and objective discussion of costs, discredits other items, such as the representation that a pumping plant taking water out of Fort Peck Lake above the ground would cost as much as drilling 500 feet through hard lava 36 times for a water system at Arco, Idaho.

The availability of materials is another point that was weighted very heavily in this Smith, Hinchman & Grylls report. The Pocatello site is indicated as being more favorable.

As the factual testimony on freight rates, which I hope you will have time to go through, will indicate, many extremely important omissions of sources of materials that apply to this specific proposition were made in the Smith, Hinchman & Grylls analysis of freight rate charges; in every case, without exception, to the detriment of the Fort Peck site.

I will now discuss evidences of partiality in the Smith, Hinchman & Grylls report.

Within this report, or rather, attached to it, is a consultant's preliminary report, a Comparison of the Pocatello and Fort Peck Sites, by Harold T. Stearns of Hope, Idaho. I presume that this material was used in order to get the advice of persons who were familiar with the areas.

The CHAIRMAN. By whom is he employed?

Mr. SKIBBINS. Hope, Idaho; yes, sir.

The CHAIRMAN. But his residence is in Idaho?

Mr. SKIBBINS. Hope, Idaho, yes, sir.

In discussing climate when making his comparisons, Mr. Stearns, of Hope, Idaho, says:

Persons living in this part of Idaho—that is, Arco—

are used to the wind, but outsiders frequently leave jobs because of the wind.

Regarding winds in Fort Peck, he says:

No drifting sand, because of the absence of this material in most of the area.

I can appreciate his disappointment.

In Pocatello, Mr. Stearns states that the "sunlight is abundant and the climate is healthy."

Regarding Fort Peck in this respect, he says:

Not familiar with the climate at this site. Probably lower temperatures than at the other site.

Usually in making a comparison when you are not familiar with one side, you do not judge both. This comparison in the report, in its detail, without going into some of the more serious parts of it, should probably be reconsidered and removed from the material that is being used in this evaluation.

Senator HICKENLOOPER. Mr. Chairman?

The CHAIRMAN. Senator Hickenlooper.

Senator HICKENLOOPER. Mr. Skibbins, is that portion of the report on the climate, as between the Idaho site and the Fort Peck site, that

which generates the determination that the Fort Peck site is "poor" and the Pocatello site is "good"? I mean, is there other evidence on the climate, other than what you have read there?

Mr. SKIBBINS. Oh, yes. I understand that the climate information is particularly interesting, because the climatic data for the Fort Peck area in the Smith Hinchman & Grylls report were primarily taken from Havre, Mont., information. And, if there is anything that is a curse to the people of Montana, it is the fact that that weather station is situated there in that freak bowl that gets the worst temperatures of the United States and the worst conditions. And the people in Great Falls and the people in Helena and the people in Butte and the people in Glasgow and the people in Miles City have utterly different situations; and yet they get constant letters of condolence from people in New York City, who hear it is 58 below in Havre. Then they write them back and tell them it is only about 10 above in Great Falls, with the result that the people in the East think we are all just lying about our weather out there.

That material that is reported, and has been for 58 years, on the freak conditions in Havre should be considered as coming from a freak report. In fact, that is why the weather station is there; because it is an unusual situation in the United States. And it is rather curious to compare it with the Glasgow area, which is a good many hundreds of miles away.

The CHAIRMAN. How far is the weather station from the Fort Peck site?

Mr. SKIBBINS. Three hundred eighty miles, sir.

Senator HICKENLOOPER. Which direction?

Mr. SKIBBINS. Fort Peck is to the east, sir.

The exchange of correspondence, to be reported on later connection with the interest of the Department of the Interior in the location of this plant, should not have been quoted by Smith, Hinchman & Grylls as sources for their cost figures.

The CHAIRMAN. Well, in the report do they cite where they got their data?

Mr. SKIBBINS. No, but the data are identical with the letters which we requested for the purpose of this hearings, signed by members of the Department of Interior. So, I presume that they used that information, which is identical. Because, as I will show, they could not have gotten it from any other sources, because the other sources open to them would be the private power companies.

The CHAIRMAN. Thank you.

Mr. SKIBBINS. The original alarms regarding contamination, which, by the way we are not going to discuss, first, because we are not equipped, second, because it is not our purpose here to embarrass the Atomic Energy Commission—

The CHAIRMAN. The staff has just handed me a report entitled "Fort Peck Site Climate: Available Recorded Information on Climate Regarding the Communities and Stations Listed Below Was Used in Compiling This Report", and the following:

Glasgow, Malta, Jordan, Sentinel, Butte Pass, Williston, N. Dak., Havre, Fort Peck, and Telegraph Creek.

Mr. SKIBBINS. I think you will find, sir, in going over the analysis made, that very heavy weight was given to the Havre figures. Now, that is something that only a competent man would be able to judge.

The original alarums regarding contamination seem to have originated not within the engineering firm making the survey but in a paper written by Dr. Piper of the United States Geological Survey on November 20, 1948, at the same time he suggested a site 200 miles southeast of Portland, Oreg., in an area which yesterday experienced a severe earthquake.

Here is Dr. Piper's report, provided to us at our request.

On page 117 of the Smith, Hinchman & Grylls report is the following statement:

A cost differential of 5 percent in favor of Pocatello can be anticipated on mechanical and equipment installation, in this case due to increased labor efficiency and freight-rate differential.

In a few minutes an experienced freight man will indicate how completely erroneous and prejudiced that statement is. Suffice it to say that the Interstate Commerce Commission itself would not accept that statement in any way as being true, because of published rates in the United States which indicate to the exact contrary.

Also on that same page savings are indicated in power and water costs. The water cost, as I have indicated before, is a conjecture, as is the statement coming from the Department of the Interior presumably used within this report; and the power costs, as we shall see in a moment, will have to be doubled for purposes of the Smith, Hinchman & Grylls report.

Another statement on this page, in guessing at a \$6,000,000 construction job, is that the surveying and engineering firm estimates \$150,000, or 2-percent saving in costs at Pocatello, because of differences in soil conditions and labor efficiency. That is pure conjecture, and I am sure that hardly any contractor in this construction year of 1949, especially because of the tremendous amount of work in lava rock that must be done at Pocatello, would dare to indicate within a report that he could say that there was \$150,000 saving, without saying at the same time that it was plus or minus 20 percent. And that seems to be the way most contracts are being accepted these days.

On page 118, perhaps the most important page in the Smith, Hinchman & Grylls report, is the summary of the biggest items of all, construction and operational costs.

Each of the seven items in my opinion is extremely questionable, and the fact that the sum of the engineering firm's entire evaluation fails to reveal a point differential over 5 percent between Fort Peck and Arco is a matter that is extremely significant.

In nuclear laboratory work, in the work such as the Atomic Energy Commission does, for example, scientists whose lives depend upon accuracy never quote a quantity or a difference without indicating the percentage of error possible in that quotation.

In the case of this estimate of the \$500,000,000 construction job, at a time when construction is the vaguest and most inexact work within our society, it is not realistic to ignore the fact which is widely known by the general public, namely, that you should figure for 20-percent error in a contractor's estimate.

Without further discussion of what is a painful subject, it should be agreed that the validity of such minute calculations of differences be-

tween the two areas should be retracted, and the facts reexamined for another over-all analysis.

I have here some statements which I will go through very quickly.

One of them is a statement from the State Board of Health in Helena, Mont. As to the credentials of the gentleman making the statement, he is Mr. C. W. Brinck, assistant director of the division of sanitary engineering of the Montana State Board of Health. He states that the information obtained at his meeting with the members of the Atomic Energy Commission—

would indicate that methods are available for the removal of radioactive materials at the proposed site—

at Fort Peck—

appears to be such that the present known methods of handling radioactive wastes could be safely and satisfactorily instituted in this area.

I have here another statement, that I think perhaps should go into the record, because the subject of the slow and gentle 75-year percolation of materials at the Arco site is one which is extremely interesting to the Commission and everyone concerned with this site location, because it directly affects one of the important problems, namely, contamination.

I am quoting from the Water Well Journal. This is the autumn issue of 1948. The subject is Idaho. The author is Mr. H. C. Clark, public health engineer of the Idaho Department of Public Health.

I will read, here, just a few portions of this. We will have it mimeographed and turned in in its entirety later.

A large area in southern Idaho is underlaid with lava beds which are full of crevices and voids. This is clearly shown by the fact that Big and Little Lost Rivers, Birch Creek, Medicine Lodge Creek, and Camas Creek, draining a large mountainous area in eastern Idaho north of Pocatello, sink into the lava flow and there is no surface connection to any stream draining to the sea. It is commonly agreed that the ultimate outlet of water from this drainage area is in Thousand Springs issuing from the walls of the Snake River Canyon near Hagerman.

Now, this is the lava bed in question.

These springs steadily produce many second-feet of water. Some water supplies have their source in these springs or from wells drawing water from this flow.

It is common practice in this area to dispose of wastes, such as raw domestic sewage, municipal sewage, plant effluent, irrigation drainage water, et cetera, into lava crevices, which undoubtedly connect with underground channels bearing ground-water flows. This is borne out by the fact that Thousand Springs water and many wells in the area show intermittent and often gross coliform contamination.

Without going any further with this statement, I will say that it is possible for something to percolate through rock for 75 years, for sewage to percolate in water through rock for any time at all, and still have coliform contamination.

In other words, the tenor of this report to my mind indicates that the waters beneath this lava bed in some areas are flowing very swiftly, swift enough to carry the contamination from municipal sewage plants to springs in the Thousands Springs area, and to contaminate them, and to require chlorination, which is commented on later on in the report.

The subject of geology I will go through briefly. The November 20 report of Dr. Arthur M. Piper, staff scientist to the United States

Geological Survey, mentioned before, has an interesting comment on the foundation problems at Fort Peck. He says, "Evidently the Bearpaw shale constitutes an inferior foundation material for heavy structures."

Again, in his summary, he states the Bearpaw shale is "incompetent as a foundation."

To clarify the fact that as many inconsistencies exist in this information on foundation and soil conditions as is the case on electric power, let me say that here are some of the conflicting stories.

J. Stewart Williams, another consultant whose report is attached to the Smith, Hinchman & Grylls report, a consulting geologist, says:

Any well-built structure could be considered safe from earthquake damage at the Fort Peck site. The terrain at the site is such that foundations can fit in dry undisturbed bedrock.

Mr. Harold T. Stearns, of Hope, Idaho, states:

Fort Peck: Shale at site full of numerous small faults which move when heavily loaded. The shale contains bentonite which swells and "slakes" when wet.

We herewith submit a report from the geologic staff and the president of the Montana School of Mines, an organization of long and ample repute.

The CHAIRMAN. Are you submitting that for the record?

Mr. SKIBBINS. Yes, sir. And I will read a few items from this report at this time, sir. This will all go in. All of our material will be mimeographed, and presented to you, sir.

The CHAIRMAN. All right.

Mr. SKIBBINS (reading):

Perhaps one of the most important points in favor of the Fort Peck site is the adequate and permanent supply of good water readily available from the 175-mile Fort Peck Reservoir on the Missouri River.

To go on to the subject of foundation materials:

The upland at the proposed Fort Peck site is blanketed with a veneer of glacial drift (ground moraine) consisting of clay, sand, and scattered gravel. Bedrock which is close to the surface consists of many hundreds of feet of dense compact shale (Bearpaw formation), which readily stands firm in steep-cut creek or river bluffs. The shale is highly impervious. We know of no reason why this shale should not serve as a good foundation for buildings or other structures.

I will not continue with that, except to mention the flash-flood conditions. Let me summarize the foundation matter. You find four different authorities and four different opinions on foundations. I submit that in that circumstance it will require a little bit more attention to both sides of the argument before an opinion is expressed that the foundations are not any good at Fort Peck. They seem to support the dam pretty well.

Flash flood conditions have been claimed for the Fort Peck area. Here is E. S. Perry, Chief Geologist, who published the bulk of the ground-water information in the northwest United States, and whose reports have been constantly used by the Geological Survey.

The proposed Fort Peck site is on a broad gently rolling upland near a divide of drainage. It is scarcely conceivable that with topography of this character, and with the character of rainfall and storms in northern Montana—in other words, with 12 inches a year, there is hardly any—

that there could be flash floods that would damage installations.

(The report of the Montana School of Mines is as follows:)

MONTANA SCHOOL OF MINES,  
*Butte, April 11, 1949.*

Perhaps one of the most important points in favor of the Fort Peck site is the adequate and permanent supply of good water readily available from the 175-mile Fort Peck Reservoir on the Missouri River. The water can be had by direct pumping from the reservoir which is about 5 miles distant and only 400 feet lower in elevation.

There is no positive assurance of an adequate supply of water from wells at Arco, Idaho, until after the wells are drilled, and the permanency of supply will not be known until after years of pumping, and the draw-down of the ground-water level is determined.

An analysis of the Missouri River water, which supplies Fort Peck Reservoir, shows 186 parts per million total dissolved solids (which is very low) with a hardness of 148 parts per million. This water is used for municipal supply for the city of Great Falls. The mean annual flow, or run-off, for Missouri River is given as approximately 10,000 second-feet by the United States Geological Survey, with a maximum of about 50,000 second-feet in June, and a minimum of about 3,200 second-feet in September.

The cost of installing equipment for pumping water, of course, cannot be estimated without specifications of volume needed, type of pump equipment, size of pipe lines, and other factors. However, it is probable that a single unit delivering 300 gallons per minute, with a lift of about 400 feet, over a distance of 5 miles, will cost approximately \$100,000 to \$110,000. This would include pump, motor, control equipment, and a 12-inch pipe line. The proportionate cost would decrease if additional units were added.

#### RADIOACTIVE WATER FROM DISCHARGE

Montana School of Mines has no experience with, or information concerning, probable character of waste water from a plant such as is planned for Arco, Idaho. We would infer that it would not be greatly different from waste water at the Hanford or Oak Ridge plants. We have heard that water from these plants has not materially affected wildlife along the rivers receiving discharge water, and hence we would expect a similar condition in the Fort Peck region. It must be admitted, however, that a procedure of confining the waste water underground and forcing it to pass through 50 or 100 miles of porous lava flows would be more assuring of a safe disposal of waste water.

#### FOUNDATION MATERIALS

The upland at the proposed Fort Peck site is blanketed with a veneer of glacial drift (ground moraine) consisting of clay, sand, and scattered gravel. Bedrock, which is close to the surface, consists of many hundreds of feet of dense compact shale (Bearpaw formation), which readily stands firm in steep-cut creek or river bluffs. The shale is highly impervious. We know of no reason why this shale should not serve as a good foundation for buildings or other structures. Thin bentonite beds occurring in the shale formation should not prove harmful to properly constructed foundations. A persistent 1 to 2-foot bentonite bed known to occur at depth at the dam site should be several hundred feet deep at the proposed plant site on the uplands, and hence should not interfere with foundation construction.

#### FLASH FLOOD CONDITIONS

The proposed Fort Peck site is on a broad gently rolling upland near a divide of drainage. It is scarcely conceivable that with topography of this character, and with the character of rainfall and storms in northern Montana, that there could be flash floods that would damage installations.

The above report was compiled by Dr. E. S. Perry, Chief Geologist, Montana Bureau of Mines and Geology.

E. S. PERRY, *Chief Geologist.*

Approved:

FRANCIS A. THOMSON,  
*President, Montana School of Mines.*

Mr. SKIBBINS. Having concluded that information, I will go on, to one of the final points in our argument here today, sir, which pertains almost entirely to the Smith, Hinchman & Grylls report, and that is as to the subject of electric power. I am going to go through this hurriedly, because I see our time is short.

I am going to report from some letters and some newspaper accounts from the Commission, from the Department of the Interior, and from persons connected with this entire project.

The following information was taken from page 32 of a survey by Arthur M. Piper, and summarizes the water resources, which are given a very poor rating, and summarizes the foundation resources, which are given a very poor rating for the Fort Peck area, and is dated November 8 to 12, 1948.

The report goes on to say that the desired energy of 50,000 kilowatts is currently available only in the sense that generating capacity of the Fort Peck power plant now exceeds that requirement.

Now, however, in regions surrounding the Fort Peck area, as in most of the Nation, existing energy loads tax the full peaking capacity of existing generators.

I would like to quote from a letter addressed to Mr. David Lilienthal by Mr. J. A. Krug, Secretary of the Interior. This letter is dated November 26, 1948. It consists entirely of points which the Department of the Interior wishes the Atomic Energy Commission to consider in connection with its interest in the Fort Peck area, namely, that steps should be taken to prevent pollution of the streams, that consideration should be given to the regulation of wildlife, and the stimulation of grazing, and that attention should be paid to the interests of the Fish and Wildlife Service.

The letter states that at that time two geologists were gathering adequate information on the Fort Peck area, and that it was hoped by Mr. Krug that the decision would be delayed until that report had been prepared. That report is a report of Mr. Piper's, which definitely includes all of these reasons, in my opinion spurious, militating against the Fort Peck area.

Here is a letter to R. C. Price, written by Mr. Warner, director of engineering. This is dated January 28, 1949:

As we have discussed with you, we are now making a comparative study of the Fort Peck, Mont., and the Pocatello, Idaho, sites, and it would be particularly helpful if your comments included information on the Fort Peck as well as on the Pocatello site. As indicated by a copy of a memorandum left with you on January 14, 1949, we have discussed many aspects of our problem with several individuals of the Interior Department \* \* \*.

We understand that sufficient water will be available at both the Fort Peck and Pocatello sites, but that surface water from the reservoir at Fort Peck, which is the more desirable source of supply, will cost between 1 and 10 cents per 1,000 gallons. \* \* \*

In a few years, it is probable that power will be more readily available at Pocatello than at Fort Peck, particularly since Pocatello is destined to become the center of an extensive power grid. \* \* \*

Since the cost per kilowatt capacity is less on the Snake than on the Missouri River and since transmission over shorter lines is possible in the Northwest system, electric energy will ultimately cost less at Pocatello than Fort Peck. At the present time the cost is 0.43 cent per kilowatt-hour at Fort Peck. We understand that for long-range planning it is practicable to assume that the generation cost of Pocatello will be about 0.2 cent per kilowatt-hour less than at Fort Peck.

Here is another letter of Secretary Krug's, addressed to Carleton Shugg, Deputy General Manager, Atomic Energy Commission:

The capacity of Fort Peck would be able to fulfill the estimated needs until 1952 (22,000 kilowatt) without the additional unit at Fort Peck. When the additional unit is in service the requirements of 51,000 kilowatts in 1955 can be met.

Water is available for the development of 100,000 kilowatts more power at Fort Peck. The Army engineers are now investigating the desirability of this additional capacity.

#### Regarding the Idaho site:

Power could be supplied to the site by means of a transmission line to American Falls or by partial construction of a BPA Pocatello-Great Falls 230-kilovolt line. Until 1950, when the Anderson Ranch Dam comes into production, there is no Government capacity available to the site except by wheeling from Fort Peck. \* \* \*

The Fort Peck rate would apply to the part of the power supplied to the Montana site from Fort Peck project. An interim rate averaging 5.5 mills is now in effect on this project. This may be revised slightly at some later date.

For the power supplied from Government sources to the Idaho site, it is expected the Bonneville rate will apply, though the application of this rate awaits further studies. It can be estimated that power costs at the Idaho site will be some 2 mills less than at the Montana site.

He stated Montana was 5.5; 2 mills less is the rate of 3.5 for Idaho.

I have here a release of March 23. The headline is "Raver Denies Idaho Project To Get Hungry Horse Power Great Falls." The release is from Kalispell.

Dr. Paul J. Raver, Bonneville Administration head, today disputed recent remarks concerning the Hungry Horse project and the proposed Idaho atomic reactor project.

Raver's views were expressed in a statement to the Flathead citizens' committee.

"The Bonneville Administration does not now have, nor does it expect to have, any application from the Atomic Energy Commission for power for the Idaho atomic plant," Dr. Raver said.

The CHAIRMAN. Is your point that they are going to get it from Fort Peck?

Mr. SKIBBINS. At what site, sir?

The CHAIRMAN. At the Idaho site.

Mr. SKIBBINS. No, sir.

The CHAIRMAN. What are you proving? I just do not understand what you are trying to prove to us.

Mr. SKIBBINS. I will sum it up in just a moment, Mr. Chairman.

The CHAIRMAN. I would like to have your summary now. I do not get all this. What is the point? I want to know. Tell me what it is now.

Mr. SKIBBINS. Here is the point very briefly, sir.

The dire need for power in this project, according to the next statement, will go up to 70,000 kilowatts. We have been informed that the power, according to the statement of one of the members of the Commission, will come from private power sources.

Now, in the Smith, Hinchman & Grylls report of March 1949, in these letters that I have quoted to you, the figure of 3½ mills is constantly used as a cost for the power.

The Administrator of Bonneville states he has no application for service at Arco.

His 1949 plans for the extension of his transmission service shows this line [indicating map] with connections to Hungry Horse going

to Anaconda and coming down within 5 miles of Arco and going into Pocatello.

Mr. Lilienthal stated on March 29, in writing a letter to Mr. Mansfield, that—

we plan to obtain the power for the station from generating equipment installed at the station, and from the Idaho Power Co.

All these facts make it clear that no public power is involved in the representations of the people making the Smith, Hinchman & Grylls report. No Bonneville grid system is involved, although Mr. Warner's letter of January 28 to Mr. Price in Interior says that—

it is probable that power will be more readily available at Pocatello than at Fort Peck, particularly since Pocatello is destined to become the center of an extensive power grid.

The CHAIRMAN. Your point is that that is not so? That there is not going to be available public power there? Is that your point?

Mr. SKIBBINS. Well, according to the statements that we have received, sir, the representations are that the Government is not, despite these evidences, going to use public power in that area for the immediate needs, and that the Idaho Power Co. is involved.

The CHAIRMAN. Your point is that there is public power now at Fort Peck, and there is private power in Idaho. Is that it?

Mr. SKIBBINS. That is part of it; yes, sir. That is part of it.

The CHAIRMAN. And that is something to be weighed against the Idaho site?

Mr. SKIBBINS. That is part of it.

No, sir; our point is on the Smith, Hinchman & Grylls report, which I will discuss right now.

The Idaho Power Co. published a financial statement on December 31, 1948, and stated that they sold 837,675,516 kilowatt-hours in 1948.

Their statement goes on to say that they paid \$2,858,905 in taxes.

Simple division indicates that their tax per kilowatt-hour is 3.4 mills. This power company is reasonably efficient, pays decent wages, and must add another 2 mills for \$2,000,000 in wages.

It is inconceivable that they could sell power to the AEC at less than 6 mills per kilowatt-hour.

The CHAIRMAN. In other words, your point is that the estimate for power that they have put in at Pocatello site is too low. Is that it?

Mr. SKIBBINS. That is correct; yes, sir. That is my point.

The CHAIRMAN. Does the engineering report of the Commission indicate that the figure that was used was submitted by the utility company to the engineering firm?

Mr. SKIBBINS. No, sir. I do not believe that any statements have been made regarding any rate having been received from the Idaho Power Co.

I called them up and asked them if they had given anybody a rate, and they said, "No."

The point that we are making here is: How can all these power-cost assumptions favoring Pocatello, favoring Arco, and so forth—how can the cost of steam-generation plants and all this other matter—use a 3½-mill rate for electricity, when it is apparent that the Idaho Power Co. rates, if they are the ones to be used, must be considerably in excess of that?

Only the extension of the Bonneville grid system from Hungry Horse to Kerr to Anaconda to Pocatello would permit a  $3\frac{1}{2}$ -mill rate and up to 80,000 kilowatts of power, which is what is required.

Representative DURHAM. In the report, both of them were placed in a very good position, in the final report.

Mr. SKIBBINS. In the discussions of the cost of the steam plant, the cost of operating the installation, the cost of electricity, the Fort Peck site was militated against because it was rated at a 5.5 mills per kilowatt-hour rate, while the Pocatello site was rated at 3.5. It is that confusion that we would like to clear up.

If asked, the Idaho Power Co. would probably set up a 6-mill rate. This should give Fort Peck the advantage on power, because its output is rated at 5.5 mills or less.

Representative DURHAM. It is just a difference in the cost, you are submitting.

Mr. SKIBBINS. Yes, sir.

Now for a brief summary.

We feel a reasonable doubt exists as to any of the preferential analysis regarding the selection of the Arco site. We feel the engineering firm making the survey was perhaps inadequately supplied with the facts, some of which we have elucidated.

We are not in a position of being a fine engineering survey organization. We are just ordinary citizens that have been looking at this thing and wondering what on earth is the story. Because sound reason says, "Here is all the water. Here is all the waste land. Here is all the power. What is the reason that this thing should be put some place else, where they do not have those circumstances, when determinations can be arrived at which point to the fact that there is reason for another judgment?"

It seems clear that no \$50,000,000 advantage exists at Arco as stated in the engineers' summary, but on the contrary Fort Peck, Mont., has a \$32,900,000 advantage in this general summary, in original costs, and a \$3,295,750 advantage in operating costs, every year of operation of the plant.

There are enough discrepancies of judgment, and we feel there is enough uncertainty as to the statement that we have made here to suggest that a thorough and a factual and an impartial investigation could be made at this time with good cause.

The CHAIRMAN. Now, just a minute. Let me get this straight. Are you suggesting an investigation on the basis of mistaken judgment? Or do you suggest some bad motive?

Mr. SKIBBINS. No, sir. I am merely suggesting—

The CHAIRMAN. I do not want to ask you an embarrassing question, but I want to get it straight for the record.

Mr. SKIBBINS. That is not at all embarrassing, sir. We are only interested in securing an adequate evaluation of the facts regarding Pocatello, on the one hand, and regarding Fort Peck, on the other hand. Because we are convinced from everything that we have been able to find out that that is all we have to do to get the plant.

The CHAIRMAN. Do you think you might be slightly biased?

Mr. SKIBBINS. Yes, sir? And that is why we ask that the judgment be made by an authority who would not be biased. And I have no idea how such an authority could be found.

The CHAIRMAN. Do you allege that this engineering firm was biased in its approach?

Mr. SKIBBINS. I think that the information that they had was not enough for them to come to an adequate decision; and I think that some of the consultants that they used were biased in their approach in some respects.

The CHAIRMAN. Whom do you mean by that?

Mr. SKIBBINS. I am thinking, perhaps, of the gentleman from Idaho.

The CHAIRMAN. Where does he come into the picture, anyway?

Mr. SKIBBINS. He is the consulting geologist whose report is appended.

The CHAIRMAN. Was there a consulting geologist selected from Montana?

Mr. SKIBBINS. No, sir.

The CHAIRMAN. Is that the only place this man works, in Idaho?

Mr. SKIBBINS. I have no idea, sir. I don't know the gentleman, and I have not investigated him.

The CHAIRMAN. I see.

Mr. SKIBBINS. Our point is that in going through any report, you gentlemen have all had experience, and you can tell what they are trying to sell. This report is selling the Pocatello area. I do not think either area should be sold in a report of that caliber. And that is the gist of our remarks.

The CHAIRMAN. On the other hand, they were retained to recommend what in their judgment was the best site, were they not?

Mr. SKIBBINS. That is correct, sir.

The CHAIRMAN. Is that right?

Mr. SKIBBINS. Yes, sir.

The CHAIRMAN. That is what they apparently did.

Mr. SKIBBINS. Well, sir—

The CHAIRMAN. Now, as I get it, your complaint is that the facts upon which they made that recommendation are (1) not sufficient, and (2) not facts; that they are misstatements of fact.

Mr. SKIBBINS. And of opinion.

The CHAIRMAN. And of opinion.

Mr. SKIBBINS. And I think the freight-rate testimony, which would take about 5 minutes, is the classic example of that fact.

The CHAIRMAN. I see.

Do you think you have summed it up pretty well? Is there any other material you would like to put into the record? Perhaps we could receive it and print it.

Mr. SKIBBINS. The only other statement I would like to make, sir, is that all this material will be supplied to anybody who wants it, and we are only interested in getting this plant. We do not want to put anybody on the spot. If we have done so, we cannot help it.

The CHAIRMAN. You are not putting us on the spot, certainly.

Representative DURHAM. We stay on the spot.

Mr. SKIBBINS. We want the truth to be used in the making of this decision, and we feel that we have a fine argument for it. That is the only reason why we came to Washington the first time, and that is the reason we got so very, very irritated by the fact that there seemed to be a run-around in the treatment that we received. And we are dumb enough not to know when we are licked?

The CHAIRMAN. Thank you very much indeed.

Obviously we cannot finish in this morning's session.

I personally want to examine this engineering survey. Also, I want to examine the Director of Engineering.

Representative HINSHAW. Mr. Chairman, in listening to the statement concerning power, I note that he has taken figures put out in an annual statement by the Idaho Power Co., dividing the total number of kilowatts sold by the sale price, which, of course, results in an average price of power, as between the lowest wholesale rates and the highest retail rates, which the company sells it for.

I wonder if that has been considered in the testimony which the gentlemen gave to us.

Mr. SKIBBINS. May I reply to that, sir?

The CHAIRMAN. Yes.

Mr. SKIBBINS. As a matter of fact, I think if any inquiry were made—which I don't believe has been made—of the power companies concerned for these large blocks of power, scheduled for the next 5 years up to 70,000 or 80,000 kilowatts, it would quickly reveal the rate at which they can provide it.

I think that if that evidence, which is not available in this report, nor in any report that I have seen, were made available, I believe that evidence would bear out the testimony I have presented today. But I cannot speak as to that.

Representative HINSHAW. Is it true that you arrived at the figure you did by simple division of the total amount of power sold and by the total number of kilowatt-hours?

Mr. SKIBBINS. I made the division just as simply as it could be made, ignoring the large block of power proposition, with the understanding that the Commission or the committee might be more interested in checking up on that particular point. Because I think it is vital. After all, what is the rate? That is the essential point of the discussion, and I think that the rate will prove, without any shadow of doubt in my mind, to be above the rate at Fort Peck, Mont.

Representative HINSHAW. But you are willing to admit that that is not a proper way of arriving at any wholesale rate for power: to divide the total income of a power income by the gross number of kilowatt-hours sold.

Mr. SKIBBINS. Well, I don't know about the propriety of it. I would say that it is not more than a few mills apart. I have never been a power-rate engineer, nor connected with a power company.

I also stated that the material I presented was merely the best that I could do in my thinking, and that it merits checking up by competent people who are aware of these problems.

Representative HINSHAW. That is all, Mr. Chairman.

The CHAIRMAN. We obviously cannot finish. We have got to go to the floor of the Senate. We will resume at 2:30.

(Whereupon, at 12:40 p. m., the committee recessed, to reconvene at 2:30 p. m. of the same day.)

#### AFTER RECESS

(The hearing reconvened at 2:30 p. m.)

The CHAIRMAN. The committee will be in order.

I think the next witness is the person who will testify on the rate situation.

Mr. LOBLE. May I have one question of Mr. Skibbins, and then I will have the rate man and one other witness, and then we are through.

The CHAIRMAN. Is there to be another witness?

Mr. LOBLE. We have just one local man from Fort Peck.

The CHAIRMAN. What is he going to talk about?

Mr. LOBLE. He lives there.

The CHAIRMAN. Is he a chamber of commerce representative who wants to boast about the town?

Mr. LOBLE. Yes, and show you pictures of it.

Mr. Skibbins, just to clarify the matter that we had up for consideration at the time of adjournment, with reference to the power matter, as to what the cost is at Fort Peck and what the cost is at Pocatello, you were asked a question by the chairman and I do not think it was clear. In a word, give us the picture.

#### STATEMENT OF G. J. SKIBBINS—Continued

Mr. SKIBBINS. From what we can understand on page 8 of the Smith, Hinchman and Grylls report, the annual power requirements in 1955, when the plant is presumably complete, are stated to be 394,000,000 kilowatt-hours per year. That is plus an additional community demand, also indicated on page 132 that is, the demand for the community serving the plant, of another 20,000,000 kilowatt-hours per year. That gives a total of 414,000,000 kilowatt-hours per year, which is a rather heavy power demand and seems to be an important factor in the development of this plant. This plant, we understand, will eventually develop power itself.

In that 414,000,000 kilowatt-hours per year total, there is a charge at Fort Peck for it, at the present quotations in the Smith, Hinchman and Grylls manual, of  $5\frac{1}{2}$  mills. That gives a dollar charge per annum of \$2,277,000. That would be the annual Fort Peck bill.

The question is, we would like to know how to compare it with the annual bill at Arco. The thing that is difficult to understand is exactly who is supplying or who will supply the 394,000,000 kilowatts in the Arco area. If it is to be private power, we are aware of the general principle that a public power dam such as Fort Peck would normally be presumed to supply power cheaper than a private operation. Therefore, we think we should be given the advantage in all electric power considerations, in all considerations on the cost of the steam plant and your costs of your operation of your plant that are related to power.

The situation in the report is the reverse. In the report a  $3\frac{1}{2}$  mill item is used very generally as the cost of the power. The point that we cannot understand is: Where is that power coming from at  $3\frac{1}{2}$  mills, because throughout the Nation I think it is accepted that 3.3 or 3.4 or 3.5 mills per kilowatt-hour is a general average of taxation on private power companies per kilowatt-hour.

The CHAIRMAN. Did you communicate with the Idaho Power Co. at all to check up on this?

Mr. SKIBBINS. Yes; I believe I called them at one time from Montana.

The CHAIRMAN. Did they say that they would furnish the power for the rate that is mentioned in the report?

Mr. SKIBBINS. The Idaho Power Co.—and here again they are interested in Idaho and in developing Idaho, and they are delighted to see this plant come in, and they certainly—

The CHAIRMAN. I understand all of that, but that is not what I asked you. Did they tell you, when you called on them, that they would sell the power at the price at which the report says they will sell it?

Mr. SKIBBINS. No, sir; they had no information on the price of power, according to the conversation that I had.

The CHAIRMAN. Where did the engineering firm get this figure; do you know?

Mr. SKIBBINS. No, sir; I do not.

The CHAIRMAN. And you say that figure is too low?

Mr. SKIBBINS. Yes, sir; if it is from a private power company, as stated in some of the other evidence submitted this morning.

The CHAIRMAN. How much is it, 3.5 mills?

Mr. SKIBBINS. Yes.

The CHAIRMAN. What do you think it ought to be?

Mr. SKIBBINS. Six mills, if it is private power.

The CHAIRMAN. And so, if they are getting it for 3.5 mills, then the Idaho Power Co. may be selling it at a loss in order to develop Idaho. Is that the only conclusion that you could come to?

Mr. SKIBBINS. You might look at it that way. I know that they sell power to the phosphate companies over there in a situation something like that.

The CHAIRMAN. For how much, do you know?

Mr. SKIBBINS. I assume that it is somewhere between 3.5 and 4 mills, because I have been studying the phosphate industry and I know that is something that is required.

The CHAIRMAN. They can sell it at 3.5?

Mr. SKIBBINS. It is a possibility for them to sell it at 3.5; they can sell it at any price.

The CHAIRMAN. They can sell it at any price, but apparently they can sell it at 3.5 and break even, anyway.

Mr. SKIBBINS. I am not sure of the profits on that, and I think that that is a very vital point: Are they making money at that rate?

The CHAIRMAN. I mean, that is no concern of the Atomic Energy Commission if, in considering a site, they find a place where they can get power for 3.5. I cannot quite get the point of your claiming that it should be 6, and that the Commission should look at it on a 6-mill price basis.

Mr. SKIBBINS. My point is this, sir: I do not know of any rates having been quoted, nor have I seen any evidence from the Idaho Power Co. of what rate they will set up for this power load going up to 80,000,000 kilowatts.

The CHAIRMAN. But you do see a price quoted in the report as 3.5?

Mr. SKIBBINS. Yes, sir; but we still do not see that it could come from a private power company in that area, and our point is essentially not the one that is under discussion, but can it not be presumed that in an area such as Fort Peck where you have this large Government dam installed, and which is today selling power, as I have inquired and found out, 35,000 kilowatts constantly at between 1 and 2 mills, which is substantially underneath all of these figures, as dump power, and can eventually develop to 105,000 kilowatts—can it not be presumed logically, and is not this the fundamental reason for all public power

development, that a Government dam could invariably undersell a private power company for a long-term heavy load such as this? Now, that is the only point that we want to establish on electric power.

Senator JOHNSON. I did not understand the point you made a moment ago about taxes on a private power development. Did I understand you to say that that amounted to approximately the price that this power is supposed to be furnished for? What did you say about taxes on private power?

Mr. SKIBBINS. It is my understanding that throughout the Nation, the average—and I do not have any papers right here with me—that the average of taxation per kilowatt-hour for electric companies is somewhere around 3.4 or 3.5 mills per kilowatt-hour. Now, my memory may be faulty, it may be 3, and I do not know what it is, but that is my understanding, that it is in that range. And my inquiry as to what range it was revealed that it would be amazing if this heavy a load could be permanently supplied at that price.

The CHAIRMAN. I should think you would have asked the Idaho people how they are going to do it.

Mr. SKIBBINS. Well, I did not think that that was my prerogative, because it is my understanding that they were asked for construction power and not for operating power.

Senator JOHNSON. The public-utility agency of Idaho would have to know about that power and would have to authorize it and grant it before they could enter into a contract with anyone.

Mr. SKIBBINS. Sir, my inquiries of the Idaho Power Co. leave me in this position: They have only been asked about construction power. We are interested in talking about Fort Peck, and they have not been asked for a rate. That may be 100 percent wrong, and if it is wrong there are some letters somewhere to prove that it is wrong.

What we are talking about is the entire power load of the operating plant when it is going. That is the thing that we are interested in, in using Fort Peck for that purpose because of its large potential and its present large dump power production, which is not doing Montana any particular good.

The CHAIRMAN. Is there any estimate in the report of how much power they will require when they are operating?

Mr. SKIBBINS. Yes, sir; I just quoted the figures. The plant itself is 394,000,000-kilowatt-hours per year, according to the report, and there is a 20,000,000 kilowatt-hour per year addition for the community which will of necessity have been established by that time.

In other words, an 80,000-kilowatt capacity has to be right there when this plant is operating. That is what we are trying to find out, as to whether we can develop an advantage, because we have got this plant in operation at Fort Peck and we do not see any plant in operation in or near Arco.

If I may finish up my remarks, I merely want to point out again that we are not experts of anywhere near the caliber of the Commission or anywhere near the caliber of Smith, Hinchman & Grylls, which in my opinion is a fine engineering firm. I would regret very much if any individuals in the Commission or in the engineering firm were put on the spot, because that is not the kind of a thing that we are trying to develop, no matter what impression we may have created.

The CHAIRMAN. I do not know what you mean by being put "on the spot."

Mr. SKIBBINS. What I mean, sir, is that I do not want to suggest that we think that there has been anything preconceived or that this thing has been privately arranged or that the Smith, Hinchman & Grylls firm is guilty of a culpable error, because that is not our point at all. We are trying to indicate that we see some additional facts and some misconceptions that can have naturally arisen in an investigation of this size and scope. And because it is maybe the No. 1 plant location in the United States in the year of our Lord 1949, we think maybe we have got some good reason for coming in and trying to talk about them and getting an adequate answer in rebuttal.

The CHAIRMAN. I just want to say when any public official is called in to explain a decision, the basis upon which he arrived at it, it is part of his job. He is not on the spot at all. He has to defend it, and that is what these people are here to do. They are not on the spot.

Mr. SKIBBINS. Well, that is fine. The point of my remarks was to remove that impression that that is what we were trying to do, because I have no familiarity with any procedure of this kind, and I have never taken part in it in my life. It is all very new to me.

On the point of coal savings, in 10 years it would be \$1,725,000.

The information you are going to hear on freight rates will range between a \$15,000,000 savings and a continual yearly savings in all shipments, which are heavy, that will come out from the East.

Regarding land, we are going to provide it free; and regarding housing, we are removing a ten- or fifteen-million-dollar responsibility from the Commission's shoulders, and we are going to do our best to see that everything in that community is in top shape; that the recreational facilities, which you will hear about briefly, will be adequate for the caliber of people that we know are coming there, and we are going to be proud to have them.

Regarding the point of the summary on page 118, which I think is of crucial importance, which indicates the percentages between one factor and another in the costs of this construction, I again wish to repeat the point that none of these flat statements of percentages show or indicate the percentage of error that might have crept into the statements. In any such analysis, we must always, and I think it is common practice to assume a heavy percentage of error, and I know that it is a practice in science and in analyzing propositions of this size and magnitude, in which the judgment of many persons must be pyramided in order to come to a final decision.

In the report that we submitted in the testimony this morning on contamination I would merely like to stress the fact, which maybe I did not bring out at that time, that the report of the Idaho sanitary engineer indicates a flow of contamination, of sewage contamination, beneath these lava beds which is considerably faster than has been represented in that report. If it were not faster, the contamination could not exist.

I have no question that that is important, because when we met with the Commission before we were informed that they wished to save 6 months' time. This was just one of the factors that was mentioned. They stated they wished to save 6 months' time, and they wanted to get going in a hurry, which is natural. Therefore, the housing and the electricity being wired in, and the buildings and the streets over

there at the Navy proving ground, would be a great help to them and would mean 6 months in keeping the jump ahead on atomic development. That point was stressed to us.

But now we find out that for 1949 that point—or, at least, this is an outsider's opinion—has been pushed aside a little bit, and we are going to drill 36 wells in 1949. Now, I think that that is proof of the fact that this flow beneath those lava beds is a matter of extreme importance, and the evidence that we have submitted might indicate some doubt as to whether that flow would prove, in the last analysis, to be the kind that would insure any greater degree of prevention of contamination under existing methods of control than you could have at Fort Peck, where you have got everything in plain sight and you know how much water is going through and you know what is going through your plant and you know there is practically no rain there and you know that you are sitting up on top where you cannot have any flash floods to bother you, according to the evidence submitted this morning, and it would seem that the methods that have been developed might be sufficient.

Again, that matter is one for the experts to decide, and we are merely indicating that there is a report submitted, and it indicates some doubt of a slow percolation effect existing beneath the lava beds, but instead, in some areas at least, of a faster flow.

That summarizes everything that I have to say, sir.

The CHAIRMAN. Thank you.

**STATEMENT OF VINCENT P. BROWN, ASSISTANT FREIGHT TRAFFIC  
MANAGER OF THE GREAT NORTHERN RAILWAY, ST. PAUL,  
MINN.**

Mr. LOBLE. Will you state your name, please?

Mr. BROWN. My name is Vincent P. Brown.

Mr. LOBLE. Will you go ahead and give us your title and by whom you are employed, and give your statement to the committee of the matters involved in the freight situation.

Mr. BROWN. I am assistant freight traffic manager of the Great Northern Railway, assigned to supervision over rates and divisions. I have been employed in the freight traffic department of the Great Northern Railway for 23 years, and during all of that time my work has been the computation of freight rates, interpretation of tariffs, and the handling of rate matters before regulatory bodies and in the meetings of the carriers. At the present time I am in charge of the traffic department in St. Paul, of the operation department, and I have supervision over the construction of rates.

I want to say initially that I saw this report of Smith, Hinchman & Grylls yesterday for the first time, last evening, and I read the pages of it which relate to transportation.

From the standpoint of my experience as a rate man it is impossible, taking into consideration the geographical position of Glasgow on the one hand and the geographical position of Pocatello, and the relative positions of both Pocatello and Glasgow in the national freight-rate structure, to reconcile the report that the construction of facilities at Fort Peck should cost \$50,000,000 more than at Pocatello.

I think I can summarize my judgment of the report as I read it, in relation to transportation, by giving you three specific points:

I think, first, that the people that wrote the portions of the report on transportation ignored the summation of the transportation factors involved on the movement of the raw and finished commodities; and second, that in comparing points of production, they have not used the weighted average relative values of the points of production based on the conditions surrounding production; and third, that important production points have been completely ignored.

Taking structural iron and steel articles and steel pipe, for example, from Duluth, Chicago, and the big producing areas east of Chicago, Glasgow has substantially lower rates than Pocatello, which are predicated on the movement of these commodities in the construction of the Fort Peck Dam.

On the class rate structure which is set by the Interstate Commerce Commission, and which will be important in a plant of this character, in my opinion, because of the scientific instruments and machinery and articles of that kind which are not generally provided with levels of commodity rates, the rates to the Fort Peck area and Glasgow would be as much as 30 percent less than the rates to Pocatello from the areas of production of this type of machinery and this type of instrument, which is in the centers of population, Chicago and east.

To illustrate a point on whether or not all points of production were given consideration, the report mentions that asphalt is produced at Pocatello in a refinery located at Pocatello. Then it says that Glasgow would get its asphalt from Kevin, Mont., about 278 miles away, or from Cut Bank, Mont.

Now, in making that observation the most important asphalt-producing area in the West has been ignored and not mentioned, and that would be the Billings-Laurel area and the northern Wyoming area represented by Cody and Lovell, Wyo.

Then also they have overlooked—

The CHAIRMAN. How far away is that?

Mr. BROWN. They would be some 350 or 400 miles away. But they have overlooked the fact that there is no production of crude oil in the Pocatello area, and that the oils from which the asphalt is produced at Pocatello move very substantial distances. In fact, for certain years of operation of the refinery at Pocatello they have moved down from Cut Bank, Mont., which is only a few miles from Kevin. They moved from northern Wyoming, particularly the crude oil from which the asphalt is produced.

Those factors all enter into the situation, and it is not a fair comparison to indicate that the asphalt is on the ground at Pocatello, without considering all of the factors.

The CHAIRMAN. You mean they point out that there is an asphalt plant at Pocatello?

Mr. BROWN. Yes.

The CHAIRMAN. And they draw the conclusion that there would be no freight on asphalt. But you point out that after all, one of the component parts is petroleum, or oil, and they have not computed what it would cost to haul the oil to Pocatello; whereas there would be very little cost to hauling the oil to Fort Peck; is that right?

Mr. BROWN. There is none in hauling the crude oil to the Kevin refinery, because the wells are right at Kevin.

Now, in the discussion of cement—

The CHAIRMAN. What is the price of asphalt laid down in Pocatello and what is it laid down in Fort Peck?

Mr. BROWN. I cannot tell you that, because, as I said, I saw this report last night, and I am talking from the standpoint of transportation, which is primarily my field.

The report shows that Pocatello is reasonably close to cement plants in Idaho and Utah, and it quotes an officer of the Ideal Cement Co. as indicating that he could furnish a substantial quantity of cement at Pocatello.

Now, the report makes no comment about whether that same officer of the Ideal Cement Co. could furnish cement at Glasgow, Mont., from his large cement plant at Trident, Mont., which did furnish a substantial part of the cement that went to the same area for the construction of the Fort Peck Dam.

It also underweighs, in my opinion, the ability of the large cement plants at Duluth and Steelton, Minn., and Mason City and Des Moines, Iowa, and puts them to one side in making the comparison on cement, and ignores the State mill at Rapid City, S. Dak., and other mills that shipped asphalt into the Glasgow area for the big construction there on the dam.

Now, it mentions pozzuolanic material, which cuts down the amount of cement used in a project of this kind, and indicates it is short around Pocatello. Well, as a matter of fact, the pozzuolanic material that is going out to Hungry Horse, which is considerably west of Glasgow, is coming from Chicago, and Glasgow would be in a beautiful transportation position in comparison with Pocatello on that material.

It is axiomatic, I think, in the matter of freight rates on iron and steel articles, including wire products and machinery and the other articles that will be used, that Glasgow will never be at a disadvantage with Pocatello. From the purely practical standpoint, that is true.

There have been efforts, as I understand the use of the mention of the points of production, to show California production as being an important factor at Pocatello. Now, it is true that California has production of all kinds of articles that at one time were manufactured in the East, but our own experience on that is that the majority of the plants that go to California will have their major markets up and down the Pacific coast, and we do not find them coming too far into Montana or even into eastern Idaho.

I get to the point of mentioning a lot of these articles, because my view would be, in consideration of the transportation factors on a job of this magnitude, you should weight the production around the country, because on any big job it is never centered down to one point that is right near that job. It moves from many points. So that the position of Glasgow on the one hand, and Pocatello on the other hand, should be weighted by the production of the various articles around the country nationally, and in that respect Glasgow has the advantage.

Now, there is a statement made, and I do not know what weight is given to it, that Glasgow is on the east and west route only, and that there is no north and south transportation available to it, while the inference is made that Pocatello is on a crossways of all of the railroads in the country. But nothing could be less substantial or more inaccurate there, because we have the gateway of Laurel, Mont., reaching the whole Southwest and middle parts of the United States, which

handles the traffic right up into central Montana, and it is a main line of the Great Northern Railway.

I am not sure that there should be substantial weight to that, because I believe that after all, the way things are produced in this country today and for the foreseeable future, just as it happened in the matter of the heavy movement of war traffic, the east and west routes are the important routes, and Glasgow is on the main line on the east and west route.

I think I can say fairly that any rate man that would take the position of these two points in the national freight-rate structure will arrive at the same conclusion that I do, that there is an advantage, from the practical production standpoint, in the Glasgow area.

The CHAIRMAN. Your road does not serve Pocatello, does it?

Mr. BROWN. Not directly; no.

The CHAIRMAN. What is the direct service?

Mr. BROWN. The only line serving Pocatello is the Union Pacific.

Mr. LOBLE. Now, Mr. Brown, somewhere in this report reference is made to the fact that the plant should be within 24 hours of Chicago.

Mr. BROWN. Yes.

Mr. LOBLE. What have you to say about that?

Mr. BROWN. We are 20 hours out of Chicago on our Empire Builder train, and I do not have the exact time of the partially comparable trains over the Union Pacific, but I would say that they are at least 12 hours longer than we are, and not taking into consideration the fact that they are a branch operation.

Mr. LOBLE. Assuming a \$100,000,000 freight bill, and if that would be so on a project of this size, can you roughly give us your idea of the amount of saving that would be involved in construction costs alone, on freight?

Mr. BROWN. I think from my consideration of the materials as they appear in the report there, that I can be conservative in saying that there should be a \$15,000,000 saving on a \$100,000,000 freight bill in the Fort Peck location.

Mr. LOBLE. That is just for construction. And in the continuation of the project as it went over the years, there would be a continual saving?

Mr. BROWN. My inclination would be to feel that the materials that will be used in the operation, in the continued operation of the plant, will come from the East, and in that case there will be a continued saving in operation.

Mr. LOBLE. And one word on the coal situation. Over at Garrison they have developed a tremendous coal vein, have they not?

Mr. BROWN. That is right.

Mr. LOBLE. So large that it is not put on the market because it would destroy the market, would it not?

Mr. BROWN. I understand that it is not being placed on the market, and I am not sure what the reasons are.

Mr. LOBLE. How far is it from that coal pile at Garrison to Fort Peck?

Mr. BROWN. I think it is probably about 250 to 300 miles over the joint route of the Soo Line and Great Northern.

Mr. LOBLE. If there is no charge for that coal, belonging to the Government, except a bookkeeping charge from one department to the other, what would be involved in costs to transport it?

Mr. BROWN. We talked briefly about that last night, and my judgment now is, as was testified this morning, that the rate should be around \$3, based on our usual measures for the type of coal shipped.

Mr. LOBLE. There is a saving of \$500 a day, from what you observe in the Pocatello report, is that justified?

Mr. BROWN. I am sorry to say I did not look at the price of coal in the report, but that would be the total cost of transportation on the coal from Garrison.

Mr. LOBLE. And now a last question: Does your company maintain a department which specializes in furnishing information, down to the minutest detail, on costs involved in placing a plant and the construction of a plant, as to freight?

Mr. BROWN. We do.

Mr. LOBLE. And was your department ever contacted by this firm of engineers, or anyone else, to give you an opportunity to make that analysis of the tremendous savings in freight rates that could be accomplished?

Mr. BROWN. No, we were not.

The CHAIRMAN. What is the difference in the report? Do they claim Pocatello is cheaper than Fort Peck?

Mr. BROWN. The report makes a statement that the construction of the facilities at Fort Peck would cost \$50,000,000 more than at Pocatello.

The CHAIRMAN. Do they allocate any part of that to freight rates?

Mr. BROWN. As I read the report, and as I said I had it for a short while, there is no break-down of that \$50,000,000.

Senator JOHNSON. And your contention is that it is about the opposite of that?

Mr. BROWN. As far as freight rates are concerned, very definitely so.

Senator JOHNSON. Well, so far as prices of materials are concerned, you know something about that.

Mr. BROWN. I have no reason to feel that the points of production I mentioned would leave themselves at any disadvantage in prices of material. It would not be our experience in our long-time experience in handling materials for construction of plants.

The CHAIRMAN. I think that is all.

Mr. LOBLE. Our last witness is not a chamber of commerce witness. This is a witness who is going to answer the chamber of commerce statement in the report, speaking of the great facilities at Pocatello, and to point out something about this land. He will be a short witness.

The CHAIRMAN. I have a good deal of respect for chambers of commerce. I am a member of one myself. But we are usually "puffers", you know. That is the business of a chamber of commerce.

Mr. LOBLE. We have got the best puffer we could get, I will tell you that. I have pointed out to the witness that people are used to this in Washington, and I will ask him to limit himself, which I am sure he will do.

Incidentally, Senator Murray can speak as to the character of this gentleman because he knows him well.

Senator MURRAY. I know the gentleman very well.

Senator HICKENLOOPER. I understand that you will measure him up to the same level of exaggeration that exists in Washington, is that right?

Mr. LOBLE. Just about the same.

**STATEMENT OF PAUL J. CAMPBELL, REPRESENTING THE CHAMBER  
OF COMMERCE, GLASGOW, MONT.**

Mr. CAMPBELL. My name is Paul J. Campbell, and I am a member of the special committee of the chamber of commerce who were instructed to gather data on the facilities in the Fort Peck area for this hearing.

We took the proposed plant site as outlined to us by Mr. Jarrett of the Great Northern Railway, who accompanied a representative of Smith, Hinchman & Grylls who examined the proposed site. We blocked off 21 townships comprising 437,760 acres, of which less than 5 percent, or 23,500 acres, is privately-owned, and represents 30 private ownerships. The entire block is used exclusively for grazing purposes, and no one maintains residence on this land.

We have taken a map of the county, and we have blocked this off in red lines, and there are an additional three townships, about, that border on Fort Peck Reservoir, that can be included, and which is mostly Government-owned land.

I want to submit that for the record. The Industrial Division of the Glasgow Chamber of Commerce has agreed to furnish deeds to the privately-owned land in this block to the A. E. C.

(The map referred to is filed with the Joint Committee on Atomic Energy).

Mr. CAMPBELL. We also have some signed statements of some of the owners of that land, which I want to present for the record. I will read one of them to you:

I, the undersigned, being a resident rancher in the area being considered for the use of the Atomic Energy Reactor Plant, do hereby go on record in heartily endorsing this development for this territory.

It is my understanding that I will be able to retain my grazing rights should this plant be established in this vicinity.

Those are all alike, and they are all signed by ranchers in that particular area.

(The statements are as follows:)

GLASGOW CHAMBER OF COMMERCE AND AGRICULTURE, INC.,

*Glasgow, Mont., April 7, 1949.*

ATOMIC ENERGY COMMISSION,

*Glasgow, Mont.*

DEAR SIR: I, the undersigned, being a resident rancher in the area being considered for the use of the Atomic Energy Reactor Plant, do hereby go on record in heartily endorsing this development for this territory.

It is my understanding that I will be able to retain my grazing rights should this plant be established in this vicinity.

My land, comprising 6,400 acres, is located in the following: Secs. 1 to 6, inclusive, T. 28 N., R. 37 E.; secs. 1 to 4 inclusive, T. 28 N., R. 36 E.

W. R. BILLINGSLEY.

GLASGOW CHAMBER OF COMMERCE AND AGRICULTURE, INC.,

*Glasgow, Mont., April 7, 1949.*

ATOMIC ENERGY COMMISSION,

*Glasgow, Mont.*

DEAR SIR: I, the undersigned, being a resident rancher in the area being considered for the use of the Atomic Energy Reactor Plant, do hereby go on record in heartily endorsing this development for this territory.

It is my understanding that I will be able to retain my grazing rights should this plant be established in this vicinity.

My land, comprising 640 acres, is located in the following: Secs. 14, 15, T. 24 N, R. 38 EMM.

Yours sincerely,

GORDON M. BROWNING.

GLASGOW CHAMBER OF COMMERCE AND AGRICULTURE, INC.,

*Glasgow, Mont., April 7, 1949.*

ATOMIC ENERGY COMMISSION,

*Glasgow, Mont.*

DEAR SIR: I, the undersigned, being a resident rancher in the area being considered for the use of the Atomic Energy Reactor Plant, do hereby go on record in heartily endorsing this development for this territory.

It is my understanding that I will be able to retain my grazing rights should this plant be established in this vicinity.

My land, comprising 20,000 acres, is located in the following: All located in general area of the proposed site for the atomic energy plant.

Yours sincerely,

ETHART RANCH,  
By GENE ETHART.

The CHAIRMAN. They might not want any cattle grazing around there.

Mr. CAMPBELL. It was our understanding that the grazing rights were not discontinued in the Hanford area, and that they would not be there.

This block of land lies adjacent to the Pines recreational area, where fishing unparalleled in the State can be enjoyed. Rainbow trout, wall-eyed pike, perch, and other varieties can be taken.

The Army engineers are now in the process of spending \$1,000,000 on several recreational areas, providing access roads and shelter houses, trailer camps, service courts, picnic grounds, and so forth, plans and pictures of which I hereby submit in evidence.

(The information above referred to is on file with the Joint Committee on Atomic Energy.)

Mr. CAMPBELL. Hunting in the entire area is unexcelled. Black-and white-tailed deer and antelope abound, and in fact I had occasion to fly over that area the other day, and I sighted five herds of antelope.

Upland birds include pheasants, sharp-tailed grouse, sage hens, and Hungarian partridge. Wild geese and duck shooting is excellent. And I also have some pictures there, and I have one of myself and a friend of mine with 42 mallards that we took in 1939.

We went through a considerable boom there in Glasgow during the building of the Fork Peck Dam, and as a result our schools and public buildings were enlarged to meet that. Our public schools handled 1,468 pupils in 1936, which was the peak year of employment on the Fork Peck Dam, and we had somewhere near 11,000 men working out there at that time. The present additional facilities in the process of construction will accommodate approximately 500 more pupils. A parochial school now under construction will accommodate 400 pupils.

I wish to present the architect's drawing of this parochial school which is now in the process of being built. I would also like to present the architect's drawing of the proposed high school, and this is a proposed enlargement.

As to hospital facilities, we have the finest hospital facilities in eastern Montana, due to the fact that a new unit was added to our old hospital in 1934 to care for the huge increase in population brought about by the great influx of workmen and families on the Fork Peck

project. The hospital will accommodate 80 bed patients in addition to 20 babies. We also have photos of the hospital for the information of the committee.

Mr. LOBLE. This hospital is already there?

Mr. CAMPBELL. Yes; it is already there.

We have a civic center which will accommodate 3,500 persons, with swimming pool, wading pool, and 7 acres of park and tennis courts. I have a picture of that for the committee.

We also have a brand-new post office and Federal building, with available office space for Government agencies, three stories, modern construction, constructed in 1936.

We have 13 churches, representing almost every denomination.

We have an Army airport there that was built in 1942 for the training of B-17 crews, with three runways, 8,100 feet long and 150 feet wide, with approximately 15 miles of taxi strips.

Senator HICKENLOOPER. How long were those runways?

Mr. CAMPBELL. They are 8,100 feet long.

Senator HICKENLOOPER. And what is the width of it?

Mr. CAMPBELL. One hundred and fifty feet.

The CHAIRMAN. Is that field in operating condition?

Mr. CAMPBELL. Yes; it is, sir.

The CHAIRMAN. It is not being operated now?

Mr. CAMPBELL. Just for private flying; that is all.

Also, I have maps of the recreational areas in the Fort Peck area, prepared by the Army engineers; statements from the churches; statements from the Glasgow public schools; a picture of the airport and city; and I would also like to present a brief for the record, that was prepared 2 years ago on a hearing here before the CAB in endeavoring to get air service through Glasgow.

(The documents are as follows:)

ST. RAPHAEL'S CHURCH,  
Glasgow, Mont., April 9, 1949.

*To Whom It May Concern:*

St. Raphael's Parish at Glasgow, Mont., has a very fine parish unit—a church built about 10 years ago of concrete and steel. The church edifice itself is a beautiful mission style type of structure. It has a seating capacity of better than 400.

The new St. Raphael School is under construction at the present time and will be ready to open September 1, 1949. The school and gymnasium will be along the same lines as the church and in harmony with it. It will also be built of concrete and steel and absolutely fireproof. The building will contain eight classrooms, offices, libraries, and everything to make it modern, up-to-date, and convenient. The gymnasium contains a playing floor to meet the regulations for high-school games, showers, locker rooms, etc. It also has a permanent seating capacity of 750. On the north side of the auditorium is a stage for all entertainments and every type of program. The school has eight regulation-size classrooms and for that reason we can accommodate 400 children in an emergency.

The parish center (school and gym) are in an L shape measuring 125 by 128 feet. It is so arranged that in a very short time should an emergency or the demand arise a wing could be added for a high school or to enlarge the grade school.

The parish is rightly proud as well as the city of Glasgow and in fact north-eastern Montana of the fine additional educational unit that is being added to this district.

The newspaper picture is the architects of the new school and parish center.

Sincerely,

Rev. H. B. ALTMANN, *Pastor.*

A newspaper drawing of St. Raphael's school and gym are on file with the Joint Committee on Atomic Energy.

CORPS OF ENGINEERS, UNITED STATES ARMY,  
FORT PECK DISTRICT,  
*Fort Peck, Mont., March 7, 1949.*

#### RECREATION AT GLASGOW

The Missouri River, known for generations as the "Big Muddy," is blue now—behind the Fort Peck Dam. Located in northeastern Montana, the sparkling waters of this huge man-made lake have backed up nearly one-fourth the distance across the third largest State in the Nation.

Fish now abound in the clear waters of what was formerly a silt-laden river, and a recreational plan has been mapped for the reservoir area by the Corps of Engineers that is changing the region from one seldom visited, even by Montanans, to an area that seems destined to become one of the West's greatest recreational developments.

The history of the old Missouri River prior to construction of the Fort Peck Dam indicates that fishing was practically nil. The turbulent muddy water had little to offer the angler insofar as casting rod or fly line were concerned. It is reasonable to believe that large quantities of various types of fish inhabited the river, but to catch them was a different story. In the headwaters only could a sportsman expect to pursue a favorite pastime of fishing with reasonable expectancy of being rewarded for his efforts. The desire of thousands to have a back-yard fishing pond in the semiarid northeastern Montana became a reality only after completion of the Fort Peck Dam.

Prior to construction of the dam the only reasonable method of catching fish in the Missouri River was by use of set lines or baited traps, the latter being most successful. Fish of various types such as catfish, carp, suckers, and ling were predominant. Occasionally a sauger or wall-eyed pike could be taken by that method. Box traps, such as used by the Indians, were also a successful means of catching fish.

Now, thousands of fishermen annually are attracted by the clear blue waters of the new inland sea and the lure of rainbow and Loch Leven trout, pike, crappie, bass, perch, catfish, sturgeon, and other varieties of fish prized by anglers.

Fish are plentiful in all parts of the 189-mile-long reservoir, and according to all indications will be more plentiful in the years to come. More than 80,000 fish were caught by sports fishermen during the 1948 season, utilizing only a fraction of the lake's immense shore line. When it is considered that the majority of these fish were taken in the vicinity of the dam itself, succeeding years should yield far greater catches in view of the vast 1,600-mile shore line with a 245,000-acre water-surface area and 16-mile maximum width at full-pool level that will have a storage capacity of 19,412,000 acre-feet of water.

Because of the lack of other large bodies of water in eastern Montana, Fort Peck Lake offers a tremendous recreational potential for the inhabitants of over a 50,000-square-mile semiarid region. These people have the same recreational desires and needs for outdoor activities usually associated with water as residents of other regions. In order to fulfill these needs and desires so as to obtain the maximum possible recreational benefits for the public, the Corps of Engineers conducted a comprehensive study to determine a feasible plan of development. Six public hearings were held by the district engineer during November 1945, at Glasgow, Malta, Havre, Lewistown, Miles City, and Circle, Mont., to find out what recreational sites and facilities the people thought should be developed. Hundreds of people attended these hearings and expressed their views. Then after additional studies preliminary plans for a proposed program were developed and a final public hearing was held by the district engineer at Fort Peck in September 1946.

Another factor which has an important bearing on the wildlife of northeastern Montana is the Fort Peck game range, established by Executive order in 1936, which entirely surrounds the reservoir. This refuge, consisting of nearly 1,000,000 acres, was set aside for preservation and propagation of wildlife and for grazing purposes under the jurisdiction of the Fish and Wildlife Service and the Grazing Service of the Department of Interior. Long-range plans of Wildlife officials include building up the deer and upland bird and migratory waterfowl populations of the game range so as to permit opening portions of the refuge to hunters. Therefore, the master recreational-development plans for the reservoir area were correlated so as not to conflict with the program of development for the game range.

The final master recreational plan adopted includes one major recreational area to be located near the west end of the dam at Fort Peck, with day, over-

night, week end, and vacation-use facilities for sightseeing, picnicking, fishing, boating, swimming, and camping. Three secondary recreational areas are to be located at Hell Creek about 35 miles north of Jordan, Mont., on the south shore of the reservoir; at Rock Creek, 55 miles northwest of Circle, Mont., on the east bank of the Big Dry Creek arm of the reservoir; and at The Pines, which is located about 20 miles uplake from the dam on the north shore. Facilities to be installed at these secondary sites will be similar to but less extensive than those at Fort Peck. Also eight fishing camps are to be developed at various locations around the reservoir shore line, which are intended primarily for day use by residents within about a 50-mile radius of the localities.

The Fort Peck Reservoir area recreational plan in operation is to be coordinated with the other Federal and State agencies and local groups under the supervision and direction of the district engineer at Fort Peck. Basic initial improvements such as internal circulation roads, parking strips, turn-arounds, water supply, sanitation, and picnicking facilities are to be provided at Federal expense and through the cooperative efforts of State and local county agencies. With funds appropriated by the Congress to date for this purpose, work was started by the Corps of Engineers at the Fort Peck, Hell Creek, and Rock Creek sites during 1948 and will be continued this spring. Similar basic facilities are also to be installed at The Pines site during the spring and summer of 1949. Also, funds are available to initiate construction of an organized-group camp at The Pines during the current fiscal year, which is to be equipped and operated under a cooperative agreement by the Montana State Extension Service for youth organizations such as 4-H Clubs and Boy and Girl Scout groups. An agreement is also being arranged between the Corps of Engineers and the Montana State Park Service, whereby the latter agency will operate and maintain the Hell Creek and Rock Creek recreational areas.

Areas have been set aside at each of the four recreational sites in which plots of ground, about one-half acre in size, are to be made available on a lease basis to individuals who may wish to construct private summer lake shore cabins. Suitable locations have also been selected at all four sites for ultimate provision of boat docks, overnight and vacation rental cabins, stores, lunch rooms, playgrounds, and other facilities necessary for a well-equipped vacation center. Concessions will be granted private concerns or individuals to construct and operate the commercial features of the development program.

At the present time, the reservoir area is served by only two all-weather roads, both leading from United States Highway No. 2 to the town of Fort Peck by the dam site. One is a bituminous highway from Glasgow, Mont., 19 miles away, and the other is an oiled highway from Nashua, Mont., 12 miles distant. The remainder of the big reservoir is reached by dirt roads and trails. Through the efforts of the Garfield and Custer County Rod and Gun Clubs, over \$5,000 was raised and spent during the past 3 years to construct 13 miles of new access road and improve the remainder of the dirt graded route to Hell Creek. Likewise, the residents of several counties in southeastern Montana have formed a group to raise funds to assist McCone County to improve the route to the Rock Creek site. The people of Valley and Roosevelt Counties have also formed an organization known as the Pines Development Association to accelerate development of roads and facilities for that recreational area.

The Montana State Fish and Game Department is also actively participating in the development program. With the cooperation of the Federal Fish and Wildlife Service and local sportsmen's groups, 825,000 trout, 50,000 salmon, and approximately 50,000 bass and many thousands of crappie and yellow perch have been planted in reservoir waters since impoundment was commenced. Natural reproductions by many of these species have increased their numbers many-fold and await the sports fishermen. An area below the dam has been turned over to the State for a game farm at which tens of thousands of Chinese ring-necked pheasants have been raised during the past several years and released for hunters in eastern Montana.

Year-round fishing is permitted in the lake and in the river below the dam subject to State laws, including regular license requirements. Most of the fishing to date has been in the vicinity of the dam, the bays, and coves adjacent to the Fort Peck recreational area, and in the river below the dam and at the mouth of the spillway. Hell Creek, Rock Creek, the Pines, Snow Creek, Box Creek, Devils Creek, and Bear Creek have also been popular fishing spots for natives of the region, who report frequent limit catches of game fish. A county-wide fish fry has become an annual event for the Garfield Rod and Gun Club at the Hell Creek site. Boy Scouts of the Yellowstone Valley Council, whose head-

quarters are at Billings, Mont., held their summer encampment at Snow Creek during 1946 and 1947, and at Hell Creek during 1948. This organization has applied for a long-term campsite lease at Hell Creek.

Necessary boating, camping, and general safety and sanitation rules and regulations have been established by the Corps of Engineers to govern public use of the reservoir area. These include the registration and inspection of boats, operation of watercraft, construction of private boat docks and mooring facilities, construction standards for private cottages, disposal of waste and garbage, use of tent and trailer areas, and the manner in which other activities are to be carried out.

Tourists and other out-of-State visitors are coming to the reservoir area in increasing numbers every year. Sportsmen's and civic groups of the region are enthusiastic in their support of the development plan. With its known potentialities as an aid to navigation, a preventer of floods in the Midwest, and a source of water for irrigation and power for industrial development, Fort Peck Dam is beginning to pay off in a way that was little suspected by old-time residents when it was first proposed—as the keystone of a great recreational development, worth unlimited benefits in enjoyment and untold commercial returns from tourists to the people of northeastern and central Montana.

The CHAIRMAN. How many people are there in this town?

Mr. CAMPBELL. About 4,000, sir.

I also have a statement from the Valley County Commissioners, which I will read to you:

The Board of Commissioners of Valley County will cooperate and do all in its power to build roads to the area selected for atomic research.

That is signed by the commissioners.

I also have the same sort of a statement from the city council. That relates to enlarging the water facilities and the sewer facilities there.

(The statements are as follows:)

VALLEY COUNTY,  
Glasgow, Mont., April 7, 1949.

To the Atomic Commission, Washington, D. C.

GENTLEMEN: The Board of Commissioners of Valley County will cooperate and do all in its power to build roads to the area selected for atomic research.

BOARD OF COMMISSIONERS OF VALLEY COUNTY, MONT.,  
By MAURICE ARNOLD, *Chairman*.  
N. C. BRIGGS, *Member*.  
CARL SHELLERUD, *Member*.

Attest:  
[SEAL]

T. P. BREKJERN, *Clerk*.

[Resolution No. 621]

A resolution putting the city of Glasgow, Mont., on record as favoring the installation of any Government work at or near Fort Peck, Mont. and an agreement by the members of the city council and the newly elected members that they will cooperate in an expansion program as far as they could under the law

*Be it resolved by the Mayor and the City Council of Glasgow, Mont.:*

1. That the city council feeling that it would be for the best interest of the city of Glasgow that Government works be constructed at Fort Peck, Valley County, Mont., herewith go on record as favoring such installation and herewith agree to do all in the power of the city to cooperate with the Federal Government in any expansion program which may be necessary.

2. That the city council herewith orders the city engineer to prepare exhibits to be attached to this resolution and made a part hereof showing the facilities in and around Glasgow which would be of benefit if such a program came in.

3. That copies of this resolution be sent to the proper authorities by the city clerk.

4. That this resolution was passed in the presence not only of all the members of the city council but also of the two persons who will become members starting with May 1, 1949, and by special permission all the present and future members

voted on this resolution and it was agreed that all should sign this resolution not only so as to commit the city of Glasgow to the above program but also so as to commit themselves.

Passed by the unanimous vote of the council and approved by the mayor on April 8, 1949.

Attest:

[SEAL]

F. S. McINTYRE, *Mayor*.

M. E. HODAPP, *City Clerk*.

We the undersigned being all the members and members elect of the City Council of Glasgow, Mont., herewith agree with Resolution No. 621 of the city of Glasgow, Mont., and herewith commit ourselves to the program therein set forth.

NEIL D. CAMPBELL.  
O. E. MARKLE.  
E. H. DAVISON.  
NED C. JOHNSON.  
VERN BROWN.  
RUSSELL S. CLAIR.

#### CITY OF GLASGOW

#### MONTANA

*Civic center*.—Size: 121 by 144 feet; playing floor, 9,030 square feet; seating capacity of bleachers, 1,500; rifle range, 1,800 square feet; room space suitable for offices 5,700 square feet, plus range; swimming pool 40 by 105 feet with wading pool; 2 double tennis courts; 7 acres of park space.

*Building sites*.—Approximately 400 residential and business sites within city limits. Unlimited expansion outside city limits.

*City water supply system*.—Two wells 112 to 120 feet deep can supply 2.88 M. G. D. against 194 foot head. Concrete reservoir on elevated ground acts as equalizer. 172 feet above business district. Approximately 9 miles cast iron pipe supply grid; 27 percent of 8 inch, 71 percent of 6 inch, and 2 percent of 4 inch pipe.

*Sanitary sewer*.—Approximately 9 miles. Maximum size 28 inches and minimum size 8 inches. Adequate gravel deposits for building available in immediate vicinity.

R. C. FARGO, *City Engineer*.

Mr. LOBLE. Mr. Campbell, over these months that this has been going on, has there been intensive activity on the part of the citizens of your community, as well as Montana generally?

Mr. CAMPBELL. Yes, there has.

Mr. LOBLE. And a very definite and great desire to have this project there?

Mr. CAMPBELL. That is right.

Mr. LOBLE. The reason that you have detailed these things is not only to picturize your communities, but in the report they stress the recreational and other facilities of Arco as being important, is that right?

Mr. CAMPBELL. Yes; I understand that there was some preference on the part of some of them, and they stated they would rather live in Idaho than Montana.

Mr. LOBLE. You think that is foolish, do you?

Mr. CAMPBELL. Yes; I certainly do. We went through one of the toughest winters in the West this year out there, and there never was a time that our roads were blocked or that our train service was slowed up through that territory.

Mr. LOBLE. Was it you who said that the weather was so hot in Arco that even the rivers run underground?

Mr. CAMPBELL. No, sir; I did not say that.

Mr. LOBLE. All right.

The CHAIRMAN. When did you first hear about this project, sir?

Mr. CAMPBELL. Along about the middle of February.

The CHAIRMAN. And did you communicate with anybody in your congressional delegation at that time?

Mr. CAMPBELL. No, sir. It was stated to me that these engineers were in there, and this was a hush-hush proposition, for security reasons, and none of us made a move until Dr. Baker's statement was made in Boston and came out in the press.

The CHAIRMAN. Did you communicate with the Governor of the State or either of the Senators?

Mr. CAMPBELL. No, sir.

The CHAIRMAN. Do you know of anybody else out there who did?

Mr. CAMPBELL. In Glasgow, no, sir; I do not.

The CHAIRMAN. Or in Montana.

Mr. CAMPBELL. Well, that could have been. I did understand that the engineers contacted the Governor, from the Smith, Hinchman and Grylls firm, when they went through Montana.

The CHAIRMAN. All right.

Are there any questions?

Thank you very much, Mr. Campbell.

Mr. LOBLE. May I impose on the committee to have Mr. Flaherty, who is president of the State chamber of commerce, say a word? He came a long ways here, and I overlooked that.

The CHAIRMAN. Could he limit himself to 5 minutes?

Mr. LOBLE. I am sure that he can.

#### **STATEMENT OF JAMES J. FLAHERTY, PRESIDENT OF THE CHAMBER OF COMMERCE OF THE STATE OF MONTANA, GREAT FALLS, MONT.**

Mr. LOBLE. Mr. Flaherty, will you proceed to give your name and occupation, and your connection with the Montana Chamber of Commerce, and state anything you desire to state that will help us.

Mr. FLAHERTY. My name is James J. Flaherty. I am a wholesale merchant in Great Falls, Mont., and president of the Montana Chamber of Commerce.

Senator, our people got very much concerned on September 11 last year when Mr. Ashby, the president of the Union Pacific Railroad, said the Nation had been divided into zones, and into these zones would be fitted huge industries; and he stated, in this Associated Press dispatch, that the intermountain territory was left out.

So we became concerned over that, and did our best to try to find out how this zoning was brought about, and by whom. But it was not until along in the middle of February that we discovered it was a huge atomic-reactor plant, and it was then that our Governor got busy.

We have at Fort Peck a tremendous lake, 175 miles long.

The CHAIRMAN. Do you mind if I interrupt you just a moment? You said in September you had an announcement from whom?

Mr. FLAHERTY. There was an Associated Press dispatch given by Mr. Ashby of the Union Pacific Railroad.

The CHAIRMAN. What was he announcing?

Mr. FLAHERTY. He was announcing that the Nation had been zoned. The CHAIRMAN. For what purpose?

Mr. FLAHERTY. To set in industrial plants, and what kind of plants we could not ascertain, but we started to get busy then.

The CHAIRMAN. You connect that statement with the later development of the atomic energy project?

Mr. FLAHERTY. Yes, Mr. Chairman.

The CHAIRMAN. I think perhaps you are mistaken on that. I will not jump to conclusions, and Senator Johnson probably would know more about that.

Senator, was that in connection with the basing-point subject; do you suppose?

Senator JOHNSON. I doubt that; I doubt whether it would have any connection with the basing-point matter.

The CHAIRMAN. I am very much interested, because certainly in September of last year I knew nothing about the reactor program, and I would be interested to know how Mr. Ashby knew.

Mr. FLAHERTY. We have a press dispatch, Senator, copied from the Great Falls Tribune of that time, which brought about a meeting on September 18, at which Senator Murray and his secretary were present, and the city council of Great Falls, at which we had our first meeting. And then we adjourned this meeting to Butte, Mont., 2 weeks later, to take this up.

But I do not wish to bore you, Senator, or your committee, with that.

We have free land; the greatest earth dam in the world, that holds back the largest body of water in North America behind a dam. The water is there free. Huge amounts of Government power is free.

Our experts of the School of Mines in Butte tell us we could build dikes to hold back this hot water.

Now, we get into this affair and we find out that it is going down to my good friend, Glen Taylor, a former citizen of Great Falls, Mont., and the Senator and I are good friends. But we are going to try to shoot the horse out from under Glen.

Now, we find that this plant is going down into Idaho, and I have a suspicion that they are going to steal Montana power out of the State of Montana, Government power, and run it on a line down there.

Our people do not like that, Senator, and we are mad out in Montana. We are not mad at our friends here at these tables, but you know we think we have been given the run-around. We want to know, sir—

The CHAIRMAN. Now, just a minute, Mr. Flaherty. Who gave you the run-around?

Mr. FLAHERTY. We do not know. It was not this group here. But, somehow or other, somebody carried the ball around the end when we weren't looking, and that is our fault.

The CHAIRMAN. Well, now, the Montana site was investigated by these engineers; was it not?

Mr. FLAHERTY. Yes, sir.

The CHAIRMAN. And they were the engineers that were retained by the Commission to do this job?

Mr. FLAHERTY. Yes.

The CHAIRMAN. And I intend to go into their qualifications just as soon as we finish with you.

In having made that decision, do you contend they were improperly motivated in any way in reaching that decision? You see, Mr. Flaherty, that is the question it seems to me we have to look at.

Mr. FLAHERTY. I would say that probably there were errors of judgment in the report, and therefore we asked if this case could not be reheard by the same engineers.

The CHAIRMAN. I know you meant it in good spirit, but when you say "run-around," it has a connotation of deceit and deceptiveness.

Mr. FLAHERTY. I do not intend to leave that impression.

The CHAIRMAN. I just wanted to make sure that you did not intend to accuse anybody of giving you the run-around.

Mr. FLAHERTY. Oh, no.

The CHAIRMAN. But you think that, if you had been in their place and knew both sides and had to build this plant, you would have decided to build it at Fort Peck?

Mr. FLAHERTY. I think that I would have, sir.

The CHAIRMAN. If I were the president of the Montana Chamber of Commerce, I assure you that I would have reached the same decision.

Mr. FLAHERTY. Thank you, sir.

Mr. LOBLE. I have one question. You observed, Mr. Flaherty, that the report here is dated, I think, the 26th day of March, 4 days after we were told that it already had been decided; that is, the transmittal report. Did you notice that?

Mr. FLAHERTY. Yes, sir.

Mr. LOBLE. When we came back here, the Governor came back here around March 22, I believe, and you were advised that it had already been decided?

Mr. FLAHERTY. That is correct.

The CHAIRMAN. What date is that?

Mr. LOBLE. March 22.

There was a good deal of activity all during the month of March on the part of your group and all of the citizens of Montana?

Mr. FLAHERTY. That is right.

Mr. LOBLE. And the Governor came back here and went to see the President?

Mr. FLAHERTY. That is right.

Mr. LOBLE. And on March 22, up to that time, will you state whether many letters had been received from Washington and I think those connected with the atomic energy, that Montana was under consideration?

Mr. FLAHERTY. That is correct.

Mr. LOBLE. Then, when you called at the Atomic Energy Commission after you had seen the President—you, together with the congressional delegation and the Governor, and whoever else was there, and I think Senator Ecton was there—were you advised that the matter had already been decided on the 1st of March?

Mr. FLAHERTY. I was not present at that meeting, but Senator Ecton informed me that the matter was all settled and decided—after, I believe it was, the 22d of March—it was decided on March 1.

Senator HICKENLOOPER. Where did you get the information it was decided on March 1?

Mr. LOBLE. May we ask Senator Ecton that?

Senator ECTON. Well, Mr. Chairman, the Montana delegation met with Chairman Lilienthal, and in answer to a direct question, if the Commission had already made up their mind to locate the plant in Idaho, the answer was in the affirmative. And we were given to understand that previously, probably at least 2 weeks before, there had been an order issued by the Commission to start negotiations with the Navy Department for the site in Idaho.

So, we were given to understand that it had previously been decided; and to another direct question asked Chairman Lilienthal by myself, if there was any possibility that neither site in Idaho would be acceptable or could be acquired, then could we in Montana have a third choice or have a last chance at it, in answer to that query Mr. Lilienthal said "No." So it seemed closed.

Mr. LOBLE. That March 1 date occurred at that meeting?

Senator ECTON. I am not going to state that Mr. Lilienthal said it was March 1, but we were under the impression that around about March 1 was when it was decided by the Atomic Energy Commission.

Representative MANSFIELD. I will state for the record that it was March 1.

Senator HICKENLOOPER. Upon what basis was it stated it was March 1? Was it stated at that meeting that it was March 1?

Representative MANSFIELD. Yes; and Senator Murray and Senator Ecton and Congressman D'Ewart, Mr. Skibbins, Mr. Sullivan, and the governor and myself were there.

Senator HICKENLOOPER. And on what date was this meeting?

Representative MANSFIELD. March 22.

Senator HICKENLOOPER. You were told by whom?

Representative MANSFIELD. Chairman Lilienthal; that the decision had been arrived at on March 1 to begin negotiations with the Navy Department for the proving ground at Arco.

Senator HICKENLOOPER. Thank you.

The CHAIRMAN. Mr. Flaherty, I have had sent to me a number of clippings and editorials from the Montana papers in which various people have come in for criticism because of the selection of the site at Pocatello. The Montana congressional delegation was criticized, and Senator Murray in particular, I remember, was criticized in one editorial for not having secured this site.

It is not the conception of the chamber of commerce or the people that you have talked with and represent that this should be decided on the basis of how much political strength the delegation has or has not? That is not your conception of the way this should have been done, is it?

Mr. FLAHERTY. Oh, no, Mr. Chairman.

The CHAIRMAN. And you are content to rely on the merits of the situation?

Mr. FLAHERTY. Certainly, sir.

The CHAIRMAN. One editorial in particular was written by an ignoramus. I will not go into that. It is not the first time that has happened, either.

Mr. FLAHERTY. I can assure you that none of that came out of the offices of the Montana Chamber of Commerce; you may be assured of that.

The CHAIRMAN. I would not assume that it did, but I want to get it straight for the record that it was not the idea that you people had

that this should be decided by any political considerations but rather on the merits of it.

Mr. FLAHERTY. On the merits of our case; yes, sir.

The CHAIRMAN. Because we are dealing with a pretty serious subject.

Mr. FLAHERTY. We realize that, sir, and our purpose is to carry it on in the highest way.

The CHAIRMAN. Thank you.

Mr. FLAHERTY. Thank you very much, gentlemen, for listening to us.

Senator ECTON. Mr. Chairman, may I ask Mr. Flaherty a question?

If you remember, Mr. Flaherty, I think that we would like to know when you first learned that the Atomic Energy Commission was considering the Fort Peck site or the Fort Peck area for this plant.

Mr. FLAHERTY. Around the 15th or 16th of February, I cannot give you the exact date, but the far side of the middle of February.

Senator ECTON. That is this February 1949?

Mr. FLAHERTY. That is right.

Senator ECTON. Were there not Army engineers in the vicinity and in Glasgow previously, last fall, for instance?

Mr. FLAHERTY. Yes, but we did not know what they were doing or what they were there for.

Senator ECTON. I see.

Mr. LOBLE. Thank you very much.

That concludes our case.

The CHAIRMAN. We will now call Mr. Warner. Mr. Warner is the next witness.

**STATEMENT OF ROGER S. WARNER, JR., DIRECTOR OF ENGINEERING; AND CARLETON SHUGG, DEPUTY GENERAL MANAGER, ATOMIC ENERGY COMMISSION, WASHINGTON, D. C.**

Mr. SHUGG. Mr. Chairman, may I make a statement?

The CHAIRMAN. I called Mr. Warner. He is the committee's witness, and we can hear from you later, but we are going to hear from Mr. Warner first.

What is your title, Mr. Warner?

Mr. WARNER. Director of Engineering, Atomic Energy Commission.

The CHAIRMAN. When were you appointed?

Mr. WARNER. August of 1947.

The CHAIRMAN. What was your previous experience?

Mr. WARNER. Previously I was with the Atomic Energy Commission in the Manhattan District before that, and with the Office of Scientific Research.

The CHAIRMAN. You were at Los Alamos; were you not?

Mr. WARNER. Yes, sir.

The CHAIRMAN. Where did you graduate from an engineering school?

Mr. WARNER. Harvard and MIT.

The CHAIRMAN. What year?

Mr. WARNER. 1931 at Harvard, and 1933 at MIT.

The CHAIRMAN. For whom did you work in private enterprise before you went to work for the Government?

Mr. WARNER. B. F. Goodrich was the last.

The CHAIRMAN. When did you sever your relations with them?

Mr. WARNER. April 1942.

The CHAIRMAN. That is when you went to work for the Manhattan District?

Mr. WARNER. I went to work for the Government, sir, and I went to work for the Office of Scientific Research and Development before joining the Manhattan project.

The CHAIRMAN. As Director of Engineering, what are your duties in connection with engineering contracts, or contracts for engineering services?

Mr. WARNER. At the present time, my job is merely to make recommendations as to what the best course of action is.

The CHAIRMAN. At the present time. Well, now, at the time this engineering contract was let, what was your responsibility?

Mr. WARNER. It was the same. I selected the firm to make the report.

The CHAIRMAN. You selected the firm?

Mr. WARNER. Yes.

The CHAIRMAN. I thought that you recommended to somebody else.

Mr. WARNER. I recommended to Mr. Shugg what we wanted to do, and gave him the recommendation.

The CHAIRMAN. I see. And whom did you recommend for this particular job?

Mr. WARNER. I recommended that the firm of Smith, Hinchman & Grylls be selected.

The CHAIRMAN. Will you please tell us the process you went through in selecting this firm?

Mr. WARNER. I took the general scope of work to see what it was we wanted, and I drew out a list of engineering firms from our records, and selected those firms which we had the most information on.

The CHAIRMAN. You say you drew out a list of firms you had. Who made up that list?

Mr. WARNER. It was made up from brochures of the people that had come and called on us and presented their qualifications.

The CHAIRMAN. How many are on the list?

Mr. WARNER. The original list that I have here appears to have about 30 names.

The CHAIRMAN. May I see that list?

Mr. WARNER. Yes, sir.

The CHAIRMAN. You have a list of engineering concerns there. What is the name of this firm, again?

Mr. WARNER. Smith, Hinchman & Grylls.

The CHAIRMAN. Have they ever done any work for the Commission before this?

Mr. WARNER. No, sir.

The CHAIRMAN. This was their first job?

Mr. WARNER. Yes, sir.

The CHAIRMAN. Have they done any work in connection with other private contractors in the atomic energy program?

Mr. WARNER. Not to my knowledge, sir.

The CHAIRMAN. When did they file their brochure with you and tell you that they wanted employment?

Mr. WARNER. I don't believe I can recall that directly. I would say that we had a series of probably three brochures from them over a period of 18 months. The latest brochure was submitted in connection with work proposed at Oak Ridge where they had recent and very direct information as to the capabilities of the firm.

The CHAIRMAN. Oh, had they done work at Oak Ridge?

Mr. WARNER. No, they were submitting a proposal for work.

Senator JOHNSON. They did do work for the War Department, though?

Mr. WARNER. Very extensive work, sir. And for du Pont Co. and for others; very extensive.

The CHAIRMAN. Did you submit a panel of two or three, or did you just submit this concern?

Mr. WARNER. I actually submitted only one. We had two in the running, and one was a Los Angeles firm, which was already involved in work at Los Alamos, and we could not use them at that time.

The CHAIRMAN. So you only submitted this Smith firm.

Mr. WARNER. Yes, sir.

The CHAIRMAN. In reality, Mr. Warner, you selected them, did you not?

Mr. WARNER. Yes, sir.

The CHAIRMAN. Was that done after conferences with the members of the different firms who presented their qualifications, or was it all done from a written record?

Mr. WARNER. I did not talk to members of many of the firms. I should say it was done from the written record and from discussions with other people in Washington and several people in the field who had had direct contact with them.

The CHAIRMAN. You see, Mr. Warner, the purpose of these questions, as far as I am concerned, is that there has been a challenge of the competency of these people. So the only thing we can do, if we are not to make this hearing completely worthless, is to indicate whether or not the engineers were chosen on a basis of care, and are competent.

What other work had these people done that convinced you they were qualified in this field?

Mr. WARNER. Certainly, Mr. Chairman, they can give you a list of what they have done. I can recall off-hand a large plant in Salt Lake City for the du Pont Co., a plant in Oregon, a plant in Denver, which I believe was for the Chemical Warfare Service. Well, I won't say who it was for. I do remember a plant in Denver.

Senator JOHNSON. It was the ordnance plant.

Mr. WARNER. The ordnance plant in Denver. And they have demonstrated competence in very complex chemical processing. They are the foremost in the field of modern distillery practice. They have done a tremendous amount of work for the automobile industry, and they have a national reputation.

The CHAIRMAN. In private industry, Mr. Warner, is it customary for one individual to make a choice of an engineering concern on a project like this?

Mr. WARNER. I would say, sir, for the purposes of getting a report, extending the information that one can't get oneself, it is very proper to leave it to the judgment of a few people.

The CHAIRMAN. Getting back to the basis upon which you made your choice, did I understand you to say you did not have any conversations with the engineers representing the various concerns?

Mr. WARNER. I did not have any conversations. I discussed it entirely within the Commission's facilities.

The CHAIRMAN. I see. And it was based upon your discussions with other employees of the Commission, plus their paper record, their brochures, and their record of accomplishment, that you decided this issue.

Mr. WARNER. Yes, sir.

The CHAIRMAN. Would you have extended to a construction or an engineering firm of Smith, Jones, & Brown, an opportunity to be heard in this matter if they had come down to the Commission?

Mr. WARNER. Oh, certainly, sir. But for the purposes of getting a report, extending our information, I did not feel it was the same as selecting an engineering firm in order to carry out, execute a major project.

The CHAIRMAN. There is quite a difference between those two concerns?

Mr. WARNER. An enormous difference, sir.

The CHAIRMAN. The fee that has been paid to this concern is \$36,000 to reimburse them for their expenses and a \$3,000 fee. Am I correct about that?

Mr. WARNER. Yes, sir. We allocated \$50,000 for the purposes of the report, and it looks as if they spent about \$36,000 to date.

The CHAIRMAN. And they have only charged \$3,000?

Mr. WARNER. Yes, sir.

The CHAIRMAN. Does the size of that fee excite any apprehension in you that perhaps they think they are "in" as the engineers on the project as a whole?

Before you answer that, here is the report. Of course, you can pile up a Sears, Roebuck catalog as thick as this. It does not necessarily mean, by its very thickness that it is worth anything. According to the Montana people, it is not worth very much. But certainly it ought to be worth more than \$3,000, if it is worth anything.

There was no agreement made that they were to have the engineering contract on the project as a whole, was there?

Mr. WARNER. Absolutely not. No agreement whatsoever. They may have had that in their minds, and you can ask them that directly; but there was a distinct understanding that this was for the purpose of gathering information, and it did not either prejudice or influence any subsequent work.

The CHAIRMAN. Whom did you talk with at Oak Ridge that gave them a recommendation?

Mr. WARNER. Mr. R. W. Cook, deputy manager.

The CHAIRMAN. What was his connection with them, if any? Do you know?

Mr. WARNER. None, as far as I know. He was involved in looking over the qualifications of many firms for additional work that was to be considered at Oak Ridge.

The CHAIRMAN. From whom else did you get a recommendation?

Mr. WARNER. I talked to Mr. L. E. Johnston in Schenectady but not about this particular firm. I also talked to the Construction Engineering Division in Washington.

The CHAIRMAN. Mr. L. E. Johnston is the gentleman who has been designated by the Commission to go out and take charge of this?

Mr. WARNER. Yes, sir.

The CHAIRMAN. You say you talked with him, but not about this firm.

Mr. WARNER. Not about this firm.

The CHAIRMAN. About whom did you talk with him? You see, I asked you who had recommended this firm to you, and you said R. W. Cook, deputy manager, and then you said L. E. Johnston. If you did not talk with him about this firm, I am not interested.

Mr. WARNER. Yes. Well, I don't believe that I discussed this firm with Mr. Johnston.

The CHAIRMAN. Did you discuss any other firm with him?

Mr. WARNER. I believe I did, and I can not remember which it was. I know that I called him up.

The CHAIRMAN. With whom else did you talk?

Mr. WARNER. I talked with the Construction Engineering Division in Washington.

The CHAIRMAN. That is rather an impersonal thing. With whom did you talk?

Mr. WARNER. Mr. Maher and Mr. Warren.

The CHAIRMAN. Mr. Maher and Mr. Warren. Are they both here?

Mr. WARNER. Not in the room, sir.

The CHAIRMAN. I mean they are here in Washington?

Mr. WARNER. Yes, sir.

The CHAIRMAN. What was Mr. Maher's and Mr. Warren's recommendations?

Mr. WARNER. They had a number of engineering firms of specific qualifications, suitable for specific purposes, and also engineering firms of national reputation, of which Smith, Hinchman & Grylls was one. And we agreed that Smith, Hinchman & Grylls were competent and available to do this particular job.

The CHAIRMAN. You say "we." Was it Mr. Maher, Mr. Warren, and yourself?

Mr. WARNER. Yes, sir.

The CHAIRMAN. Are they your assistants?

Mr. WARNER. No, sir; they are in another division.

The CHAIRMAN. Did they recommend anybody else as suitable for the undertaking?

Mr. WARNER. There were some of these people on the list that you looked at, that were recommended by them for specific engineering problems.

The CHAIRMAN. Did they give you a memorandum on this subject?

Mr. WARNER. No, sir.

The CHAIRMAN. Is there anything in writing in the Commission's files relative to the recommendations of anybody else except this firm?

Mr. WARNER. I will have to look, sir. I am not sure.

The CHAIRMAN. I would like to see it.

Mr. Maher and Mr. Warren did recommend some other engineering firms to you?

Mr. WARNER. Yes, sir.

The CHAIRMAN. Whom did they recommend?

Mr. WARNER. From memory, sir; there were several firms on this list that were recommended.

The CHAIRMAN. Half a dozen?

Mr. WARNER. In the order of four to six; yes, sir.

The CHAIRMAN. So that Maher and Warren recommended from four to six firms.

Mr. WARNER. Yes, sir.

The CHAIRMAN. You eliminated, of course, all but one and passed on one to Mr. Shugg.

Mr. WARNER. Yes, sir.

The CHAIRMAN. And that is this firm here.

Mr. WARNER. Yes, sir.

The CHAIRMAN. You did that on the basis of recommendations from Mr. Cooke, the deputy manager in Oak Ridge. Is that correct?

Mr. WARNER. I checked with Mr. Cooke to find out if he had any information that could add to what we were considering doing. So that that is essentially correct.

The CHAIRMAN. You see, you had to eliminate at least three and maybe five others that were recommended to you by Mr. Maher and Mr. Warren. You came out with this Smith firm.

Mr. WARNER. That was based on the job that we had to do when we defined the job as clearly as we could.

The CHAIRMAN. What qualifications did you see in the Smith firm that were not in the other five, or three, depending upon whether they recommended four or six, as to which you are not sure? What qualification did you see in this firm that were not present in the others that you turned down?

Mr. WARNER. As I remember it, the others did not have a national reputation in this field, although it was very good in specific fields of engineering.

The CHAIRMAN. You mean you only listed one engineering firm in the country, out of the 30 that have a national reputation?

Mr. WARNER. Out of the four or six that we are talking about, submitted by Mr. Warren and Mr. Maher.

The CHAIRMAN. But you start with a list of 25 or 30.

Mr. WARNER. Yes, sir.

The CHAIRMAN. Presumably Mr. Maher and Mr. Warren, if they knew their business, picked the best six out of that list.

Mr. WARNER. They submitted a separate list, which is now incorporated into this number.

The CHAIRMAN. All right.

Of that list you eliminated the rest on the basis that the ones they named for you did not have a national reputation?

Mr. WARNER. Yes, sir.

The CHAIRMAN. Is it your responsibility to maintain a list of engineering concerns down there?

Mr. WARNER. I have had that responsibility of maintaining lists, and I had a list that was quite complete. At this particular time the list was being shared with Mr. Maher and myself.

The CHAIRMAN. What I cannot understand is that if it is your duty to have a list of competent engineers on tap from which to select, in this case after you got through with the list that you yourself made up, you

ended up with one concern of national reputation, and rejected all the others on the ground that they did not have it. Is that the situation?

Mr. WARNER. Well, it is more than a national reputation. We wanted somebody who was competent and available and could do a month's work.

The CHAIRMAN. And were the other five that you rejected in the situation where they were not available?

Mr. WARNER. They were not available, or they did not have cleared personnel so that we could start the work at once. This was virtually set up for about a month's work.

The CHAIRMAN. You say they did not have cleared personnel?

Mr. WARNER. Yes, sir.

The CHAIRMAN. Were these the only people that had cleared personnel on the engineering list?

Mr. WARNER. No; there were others that had cleared personnel. Stone and Webster had cleared personnel. They were not in a position to put top management on this problem, and it needs top management to write a review.

The CHAIRMAN. Did you ask Stone & Webster about their availability?

Mr. WARNER. I personally did not ask Stone & Webster, but I learned about them. I can't remember exactly how I got that information.

The CHAIRMAN. In writing?

Mr. WARNER. No, sir; orally.

The CHAIRMAN. From whom would you naturally get it in the usual course of business?

Mr. WARNER. Actually, I believe I talked to Mr. Rowe, Hartley Rowe, whose connection is that of being on the General Advisory Board.

The CHAIRMAN. Hartley Rowe? Who is he?

Mr. WARNER. He is vice president of the United Fruit Co., of Boston, and closely connected with Stone & Webster.

The CHAIRMAN. And he informed you that they were not available?

Mr. WARNER. My memory is that he informed me that he did not think they were interested, and could put the proper people to work on it.

The CHAIRMAN. I see.

Who else was unavailable?

Mr. WARNER. I am not able to answer that, because I just do not recall. That was about the extent of the preparation for choosing this firm and making the report.

The CHAIRMAN. In other words, the unavailability of 5 of the concerns on the list.

You have read over the report that has been made by this concern?

Mr. WARNER. Yes, sir.

The CHAIRMAN. Are you in agreement with it?

Mr. WARNER. Certainly, in its entirety.

The CHAIRMAN. You have heard the testimony of Mr. Skibbins, who was here today?

Mr. WARNER. Yes, sir.

The CHAIRMAN. Have you any comment to make upon his testimony regarding the electric situation?

Mr. WARNER. I would rather turn that over to members of the firm of Smith, Hinchman & Grylls.

The CHAIRMAN. You have no independent judgment on that?

Mr. WARNER. No, sir, except that we have independent information from the Department of the Interior and the Corps of Engineers which was furnished to this firm.

The CHAIRMAN. I see.

Are there any other questions?

Senator HICKENLOOPER. I have some.

The CHAIRMAN. Senator Hickenlooper.

Senator HICKENLOOPER. Mr. Warner, when did this survey start?

Mr. WARNER. On the 5th of January.

Senator HICKENLOOPER. Last January?

Mr. WARNER. This year, 1949.

Senator HICKENLOOPER. I believe you said this firm of engineers had no previous experience with the Atomic Energy Commission.

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. It was winter in the area at that time, was it not?

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. And they completed their survey of both of these areas and the tracts of land involved and the soil components and the transportation and all the things that went into this report, for both sides, within that 30 days? Is that correct?

Mr. WARNER. All of the factual information was complete within the 30 days. It was smoothed over, and the factual information was improved, subsequently.

Senator HICKENLOOPER. How many sites did they survey in that 30-day period?

Mr. WARNER. Just the two. This was a comparative survey between Pocatello and the Fort Peck area.

Senator HICKENLOOPER. You had surveyed other sites, had you not?

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. Who surveyed those sites?

Mr. WARNER. There were seventy-odd, all told. Some 23 of them were surveyed entirely by Government people, the Corps of Engineers, the Department of Interior, and ourselves, with some help from the Weather Bureau and others.

Senator HICKENLOOPER. Had they been surveyed with the specific purpose of locating a reactor farm, or for other purposes, and were the data merely reviewed?

Mr. WARNER. No, sir. This information was collected for this purpose alone.

Senator HICKENLOOPER. How long did that collection of information take?

Mr. WARNER. It started as paper studies in a rather desultory way, about the last of April 1948.

Senator HICKENLOOPER. And went on during last summer?

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. You mentioned Mr. L. E. Johnston, whom I believe is the manager of operations at Schenectady.

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. Did Mr. Johnston direct a survey of the Fort Peck site?

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. Did he make a report to the Commission on that?

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. Where is that report?

Mr. WARNER. It is here in the room, sir, if you would like to see it.

Senator HICKENLOOPER. Has it ever been made public, or turned over?

Mr. WARNER. No, sir. It is classified "secret," because it contains information on the Hanford operation, which was used as a comparison, or to get some handles to see what it was that we might need.

Senator HICKENLOOPER. Who classified it?

Mr. WARNER. Mr. Johnston.

Senator HICKENLOOPER. Within the Commission?

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. It was classified in the Commission. Is it not possible to declassify those particular items of reference and information and comparison, and to release that report on the Fort Peck site as far as its physical attributes and qualifications are concerned?

Mr. WARNER. I think it is possible to delete the information and then declassify it. I have not actually spotted myself the points which cause it to be classified "secret."

Senator HICKENLOOPER. Is it true, Mr. Warner, that the Commission decided last fall that the Fort Peck site was the site to be developed, and that they expected to have the land all purchased and the site taken care of by January 1st, which was prior to the time that this engineering survey was started?

Mr. WARNER. Let me see. The survey was under way last year, where Fort Peck was the principal site. That was the standard by which we were comparing all other sites.

As far as taking the land by the first of January, I do not remember anything of that sort in the schedule.

Senator HICKENLOOPER. Mr. Chairman, if I may transpose this, may I ask Mr. Shugg that question?

Mr. SHUGG. That was my own personal goal, yes, sir; and I was in charge of that phase of the work.

Senator HICKENLOOPER. And you told me, I believe, Mr. Shugg, did you not, in a conference in my office late last fall, that that was the goal: to acquire the land by the 1st of January, so that construction could start shortly after the first of the year?

Mr. SHUGG. Yes, sir; so that construction could start when the winter weather was through.

Senator HICKENLOOPER. And that was the tentative decision, at least, made last fall as a result of the surveys that had been conducted with reference to the Fort Peck site?

Mr. SHUGG. The Fort Peck site, sir, was in the lead until, to the best of my memory, the middle of October. If you would like, I will tell you as simply as I can what went on from there.

Senator HICKENLOOPER. I do not want to be misunderstood in this. I have no interest in the Fort Peck site over the Pocatello site, or the Pocatello site over the Fort Peck site. I am only interested in what is the best site to serve the purposes of the Atomic Energy Com-

mission. As long as we are having a hearing on this matter, I do believe that the entire procedure and the determinations should be examined into; and then I think it is only fair to say why the decision was changed from, I will not say a firm decision, necessarily, but I will say that I understood late last fall that Fort Peck was the determined site, and that land acquisition was going forward. I know that I was cautioned, or asked if I would say nothing about it, for fear land values might jump in the area, in anticipation of Government purchases.

I think it is only fair, in justice to the whole proceeding, that we examine into this to see why, after December, let us say, an engineering firm was employed to survey the Fort Peck site in the middle of the winter and survey the Pocatello site in the middle of the winter, and the decision resulted in the selection of the Pocatello site.

I again assure you I am holding no brief for either site, but I do not want, so far as my personal views are concerned, to have the people from Montana feel that they have been abused, nor do I want the people from Idaho to feel that they have been abused. I think in fairness to a project of a half billion dollars and more, and its permanent location, and the importance of this thing, it might be well to lay the whole bag of bones out here and look at them.

Mr. SHUGG. You wish me to speak to that, sir?

Senator HICKENLOOPER. I did not mean, Mr. Chairman, to change your witnesses.

The CHAIRMAN. Perhaps before Mr. Shugg starts in, I have another question or two of Mr. Warner.

Senator HICKENLOOPER. If Mr. Shugg can be prepared to discuss that matter when his turn comes, that is perfectly all right.

The CHAIRMAN. Surely.

Mr. Warner, you stated that this Smith firm had never done any work for the Commission.

Mr. WARNER. Yes, sir.

The CHAIRMAN. Of any kind or character.

Mr. WARNER. Yes.

The CHAIRMAN. You told us that one of the considerations that led you to select them was that they had cleared personnel. How did they come to have cleared personnel if they have never done any work for the Commission?

Mr. WARNER. Possibly they can answer the question, sir, better than I can. My feeling is that they probably needed cleared people in order to submit specific proposals on work that was going on at Oak Ridge, or coming up at Oak Ridge.

The CHAIRMAN. You say they had been cleared. Of course, they had to be investigated by the Federal Bureau of Investigation, under the act.

Mr. WARNER. Oh, yes.

The CHAIRMAN. Were they the only ones in this list that had cleared personnel?

Mr. WARNER. No, sir. I am sure there were others that had cleared personnel. I know that Holmes & Narver had cleared personnel.

The CHAIRMAN. Were they one of the six?

Mr. WARNER. They were one of the last two.

The CHAIRMAN. By the way, will you give us the names of the concerns that were handed to you by Mr. Maher and Mr. Warren?

Mr. WARNER. I don't have those with me now, sir. I will turn them in to you.

The CHAIRMAN. You mean there was no memorandum from any one of them?

Mr. WARNER. I have no memoranda here, sir.

The CHAIRMAN. Nothing to indicate, in the file, whom they recommended?

Mr. WARNER. Nothing in this file, sir.

The CHAIRMAN. Would it be in any other file?

Mr. WARNER. I am sure that we can probably find something.

The CHAIRMAN. Is that not a little unusual? Would they not normally write a memorandum to you if they were giving you a list of firms, telling you why they had selected the ones they had selected?

Mr. WARNER. Yes, sir. They would have given me a list of firms, and I feel sure that we have notes on them. This file here was significant stuff that we might use at this hearing; it is not the original file in which all of the contract information is kept.

The CHAIRMAN. Is there someone here who could telephone down for that file?

Mr. WARNER. I could see about that.

The CHAIRMAN. Suppose you do that.

Senator HICKENLOOPER. I had another question or two that I would like to ask Mr. Warner, if I may.

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. Mr. Warner, when was what we might refer to as the firm or final decision made to locate the plant at Pocatello? What date? Do you recall?

Mr. WARNER. The paper that we presented to the Commission was presented on the 18th of February. Corrections were made, and the paper that I am looking at, which is the official copy, is dated March 1.

Senator HICKENLOOPER. The paper was submitted to the Commission on what date in February?

Mr. WARNER. It was submitted to the Commission on the 18th of February.

Senator HICKENLOOPER. And you say the paper you are looking at is dated March 1. That is the description of the paper that you are looking at.

Mr. WARNER. This is a staff paper, "Site Selection for the Reactor Testing Station."

Senator HICKENLOOPER. In the original paper to the Commission on the 18th of February, and in the staff paper, or in either of them, did you make a final recommendation as to the Pocatello site?

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. And you did firmly recommend the Pocatello site at the time?

Mr. WARNER. Recommended that negotiations be undertaken with the Navy for the acquisition of the site.

Senator HICKENLOOPER. Does that recommendation mean, or carry with it, your recommendation or the staff recommendation for the Pocatello site as the accepted and agreed-upon site?

Mr. WARNER. It certainly does. It doesn't necessary say that we can get it.

Senator HICKENLOOPER. That is right. But that was your recommendation to the Commission for its decision?

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. That was on the 18th of February.

When did the survey start?

Mr. WARNER. The survey started on the 6th of January. The interim report was submitted, I believe, the 5th of February.

Senator HICKENLOOPER. The 5th of February. You submitted your first paper to the Commission on the 18th of February, and your final corrected or revised paper on the 1st of March?

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. When did you receive the final report of the engineering firm that had conducted this survey?

Mr. WARNER. The final report came in approximately the 4th of April.

Senator HICKENLOOPER. So that you made your recommendations, your preliminary recommendations, carrying a firm commitment for Pocatello, on the 18th of February, and your corrected recommendations on the 1st of March, and you did not get the final report of the engineering survey until some time in April. Is that correct?

Mr. WARNER. That is correct, sir. But the conclusions were not to be changed from the interim report; merely a refinement of the information.

The factual information and the conclusions, as you will see in the scope of the work for the contract, were to be complete in the interim report.

Senator HICKENLOOPER. The interim report which you received early in February is the one which you are referring to?

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. Had they at that time completed the field work?

Mr. WARNER. They had completed all the field work comparing Fort Peck with Pocatello.

Senator HICKENLOOPER. Was that substantiated by data in the various lines of investigation?

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. And it was based upon that interim report that you made your conclusions in the paper of February 18 and the paper of March 1. Is that correct?

Mr. WARNER. Yes, sir.

Senator HICKENLOOPER. I am concerned, in these questions, again, I say, not that I have any preference, not the least preference, between the two sites; but I am somewhat concerned with the speed with which reverse English was put on what I thought was a firm decision in the fall. I am still a little hazy on the reasons for it.

Can you give me the general purport of Mr. Johnston's survey of the Fort Peck site, which is still classified as secret, or restricted in some way, without revealing the technical comparisons between operations necessary in the reactor farm, and the Hanford operations?

I mean, what did he generally conclude about the Fort Peck site?

Mr. WARNER. He generally concluded that it was possible to do the job and put the station at that site, as he understood it.

Senator HICKENLOOPER. Then he did not examine the Pocatello site.

Mr. WARNER. No, sir.

Senator HICKENLOOPER. So you have no comparison of personnel within your own staff, that is, such as Mr. Johnston, the manager of operations at Schenectady, would be, as between these two points. The comparison of Pocatello and Fort Peck rests entirely upon the survey conducted by the engineering firm.

Mr. WARNER. And our own people, that is, the engineering staff in the Atomic Energy Commission, and people from the Corps of Engineers, who made specific reports to us, and people from the Department of Interior, Bureau of Reclamation, USGS, all of whom made specific reports on both areas.

Senator HICKENLOOPER. Yes.

Do you know—I do not assume, necessarily, that you do unless you happen to have been told about it, but do you know the date upon which the Commission took final action, based upon your papers, this paper of February 18 and the paper of March 1? Do you know when the Commission made its final decision?

Mr. WARNER. I have always assumed it was the date of this final paper. But I might be able to correct that.

Senator HICKENLOOPER. I say that you, not being specifically on the Commission, might not have that information, but I thought perhaps you might have learned it.

Mr. WARNER. I think that the Commission, on February 8, generally approved the recommendations, and asked for refinements, changes in the paper.

Senator HICKENLOOPER. I think probably we could get that more accurately from the Commission itself.

Senator ECTON. Mr. Chairman, could I interpose a question?

The CHAIRMAN. Yes, Senator.

Senator ECTON. If the final decision was made on March 1, Mr. Warner, will you explain to the committee why all of us were not informed of it? Why was it that it was not made public at that time?

Mr. WARNER. As far as I am concerned, we had made a recommendation. The Commission had agreed to support that recommendation. And we were then in the process of negotiation, to see whether in fact we could get it, or whether the Navy could relinquish its interest.

Senator ECTON. You will recall that the first time that the Montana delegation visited with you, we were given to understand that the final determination had not yet been made. Later we found out that it had already been decided on March 1.

Mr. WARNER. I think, sir, it is a question of what the meaning of what the decision was. From my point of view the decision meant that this was what we wanted. The question was: Could we get it?

Senator ECTON. You had two sites in Idaho. I was given to understand that if you could not get one you knew that you could get the other one. So evidently you knew from the very beginning that you were going to locate it in Idaho regardless.

I think that is the think that has caused all of this confusion and commotion. The Governor of Montana, for instance, made a special trip down here, on the assumption that it had not been yet decided. Then we found out later that it had already been decided, before he ever got down here.

Mr. WARNER. I think that there is certainly confusion as to what the meaning of that decision was in the minds of people outside the Commission.

Senator ECTON. I thought it perhaps might clear up the situation if you could explain to the committee for the record why there was that discrepancy there. I think it would clear up the situation considerably, Mr. Warner, if you would explain that.

Mr. WARNER. Certainly I feel that the Commission stated what it wanted on March 1. Then, we entered into a period of negotiation to see whether it was humanly possible to get what we wanted.

When Mr. Lilienthal met with you he said, "This is the site we want, and we will go up to the President, if it is necessary, to get it."

It was a period of negotiation where we did not know what we could acquire.

Senator ECTON. We understood from Mr. Lilienthal that the Commission knew that they could get one or the other site in Idaho; that if they could not get one, they knew they would be able to get the other one.

Mr. WARNER. The Navy site, of course, is the one that we have been pointing to.

Senator ECTON. Yes, and in the event that the Navy site could not be acquired, then you were going to go ahead and get the other site in Idaho.

Mr. WARNER. My feeling is that we were pointing so hard at the Navy site that there was an alternate site in the background but the decision that we would take it was certainly not clear to me. It was an alternate site, there. But we had not gathered as much information on it as we gathered on the Navy site, largely because there was still snow on the ground, and the data on the Navy site had already been collected.

The Navy Department had already collected data on their site, and we knew what we were buying there.

Senator MURRAY. Mr. Warner, like Senator Ecton, I am very confused about your failure to let us know the situation when we were conferring with you on the first occasion. You did not give us any information whatever about what you had agreed to do, what you were going to do. You did not tell us that you had already selected Pocatello.

Mr. WARNER. My instructions, sir, were to begin negotiations with the Navy. That is the way the resolution reads.

Senator MURRAY. Then at that time you knew that you were not going to carry on any studies with reference to the Montana site, and that as far as Montana was concerned, it was out, and that you were confining yourself to an attempt to close up on the site at Pocatello.

Mr. WARNER. Certainly I wanted very much to get the Navy site. But beginning negotiations, and not having the foggiest notion of whether I could acquire the Navy site, meant that I wanted to make sure that the final contestants kept in the running until we knew what the problem was.

Senator ECTON. In other words, you did not want to tip your hand before you had to. Was that it?

Mr. WARNER. Sir, it was the beginning of a negotiation.

Senator ECTON. Well, I think in fairness to you, Mr. Warner, it should be stated whether or not under the rules or the regulations you were bound to maintain a certain sort of secrecy respecting it until final negotiations were completed.

Mr. WARNER. Certainly no secrecy under the Atomic Energy Act; I would say just normal prudence.

The CHAIRMAN. Senator Johnson?

Senator JOHNSON. Mr. Warner, will you read the last name on that page of the engineering firms, please?

Mr. WARNER. Leroy Harza.

Senator JOHNSON. He is a Fort Peck man?

Mr. WARNER. He handled some work for Fort Peck, and also for K-25.

Senator JOHNSON. Where is he located?

Mr. WARNER. I thought it was Chicago. It does not say so here.

Senator JOHNSON. He is not a resident, then—

Mr. WARNER. It says "Canadian," but I thought it was Chicago, because he has done work for the Manhattan District, and must be reached in this country.

Senator JOHNSON. He is not a resident of Montana?

Mr. WARNER. No, sir; not as far as I know.

The CHAIRMAN. What does the Canadian designation mean?

Mr. WARNER. I am not sure that I know, sir. I knew that he had done work for Fort Peck and for Oak Ridge.

The CHAIRMAN. How many concerns on that list have actually done work for the Commission before, or its predecessor, the Manhattan District?

Mr. WARNER. Nine.

The CHAIRMAN. That is all I have to ask at this time from Mr. Warner. Unless someone else has something, we will ask Mr. Shugg to start in on Senator Hickenlooper's questions.

Mr. SHUGG. At the time, Senator Hickenlooper, that you asked me as to progress, Fort Peck did stand at the top of the list, as far as our staff work went. It had not reached Commission level. No land-acquisition work had started. We had, of course, communicated with the Interior Department as to the availability of land.

Part of the reason for a change is that a site had to be tied to what was going to be put on the site. We were not after a site just for the site itself, but on account of the reactors which needed to be built.

Fort Peck, I think I could also say, although I was not here at that time, was at the top of the list for a new site in June of 1948, and all during the summer, because the most intensive site survey that had been made up to then was with reference to a very large facility, of an entirely different character, which would involve water supply and power of a comparable magnitude to that in Hanford. The possibility of the need of such a production site evaporated during the summer, and I think it is perfectly true that some of our premises as to the amount of water and the amount of power carried some hang-over from the previous site survey.

As to the reactors that were to be built on this site, for which we were supposed to be acquiring it, that program itself only hardened up during the fall. It was on November 10 that the Commission formally approved the reactor program which the staff had long been working on.

That put into focus for the first time the size and type and the probable dates when these first reactors would be built on a reactor site. The two went hand in hand, the firming up of our plans and pictures for the reactors themselves, and the type of site which they would require. So that I cannot give you dates here. This was all staff work. It was continuous work all fall. I feel that I know that there was a good deal of it, because I was personally behind it in the hopes still that we could get a decision by the first of the year.

Senator HICKENLOOPER. May I interrupt and say that you were not alone in the Commission on that? We have other statements from members of the Commission that the decision would be made by the first of the year, and work would be begun, preliminary work. So you did not stand alone in that statement, in that understanding, I am sure. I got my understanding from you, and from others that were in a position of authority there.

Mr. SHUGG. Then, one important date that I would like to stand out is November 10, 1948, which is the date on which the Commission approved the reactor program. And although we had been trying to anticipate it, and had been anticipating it, it was when a decision was made as to what reactors would be pursued, that one could speak with more certainty as to what kind of a place they needed to have it built on.

Senator HICKENLOOPER. May I just clear up one point there, to make it clear?

The staff and the General Manager's office, which you represent, are unable to go forward with actual construction or development until a policy decision has been made by the Commission; that is, until a program has been O. K.'d by the Commission.

Mr. SHUGG. That is right, sir. And we did not have our own work, in order to give the Commission, until November 10, something that they were able to come down and affirm.

At the same time, in our staff work on these sites, that we were coming down on the importance of power, that is, the amount of power and the amount of water, since these units to be built in this reactor site are test units only—they are a very small fraction of the capacity of the production reactors which had previously been contemplated—at the same time there was a growing realization in the staff that we could not dodge the contamination question. We have all kinds of resolutions on the subject, and we have plans and programs. But I can vouch for the fact that there was a definite uneasiness in our staff due to the fact that regardless of what plans or programs we had, or how good we were, nevertheless that site was at the headwaters of the Missouri and Mississippi Valley. That thinking is what led to a further search to make sure that there was not a more self-contained site.

These things all run along currently. And also, at the same time, we had not satisfied some of our questioners in our own staff that we had exhausted all the existing Government sites, or national military establishments; that is, whether there were any sites that were laid up.

Pocatello did very definitely come up late in the fall. I would not want to say here exactly what date, but it was very late, sir.

The CHAIRMAN. Who came up with it first? Do you remember?

Mr. SHUGG. Mr. Warner was the first one that mentioned it to me, and I believe that it led out most specifically from the offering of Klamath Falls, Oreg., as a natural sink. We felt that that was too

much emphasis on this question of a natural sink. But simultaneously we were going down the list of National Military Establishment bases that may have been partially set up and closed. Also, sir, I have to be responsive to your question, and I have to tell you that there were a large number of our people in our staff who were never content that Fort Peck would get us the people that we needed without our having to pay a heavy price for them.

Now, this program will go no faster than the people that we can get to make it run; and those are not just the ordinary run of construction workers.

The pace of this program will depend upon our being able to attract special skills of the sort that we have had a rather extensive experience with at Richland and Los Alamos.

Senator HICKENLOOPER. So that one important factor, as I understand, in the Pocatello site, is that you came to the conclusion that Pocatello area would be a more attractive place for people to live, and work.

Mr. SHUGG. Yes, sir. Now, we can't quote figures on that, and we have not attempted to, and we have not tried to say that people can't live anywhere. But we have had a very expensive experience so far in the Commission in regard to trying to attract and maintain people in such isolated spots as we already have. It does not solve the thing for us to lay our recreation grounds for them, or to determine what their pleasures will be. They seem to have a way of determining their own.

The CHAIRMAN. Before you go any further, Mr. Shugg:

Mr. Warner, it is always difficult, I suppose, to reach back into your own mind and say where an idea originated. Do you remember how you happened to come across Pocatello first?

Mr. WARNER. Very early in the game, possibly in June, in making a survey of the entire country, we picked out areas that might be suitable if we got more information on them.

The CHAIRMAN. Where were you born?

Mr. WARNER. In Boston.

The CHAIRMAN. You have no connection at all with Pocatello?

Mr. WARNER. No, sir.

The CHAIRMAN. I think it is just as well to have that stated for the record, inasmuch as it has been said that you were the first one to point out this area. I did not think you were from out there, from your accent.

Go ahead, Mr. Shugg.

Mr. SHUGG. Pocatello, as I have said, did come up for serious consideration late in the fall. We worked as fast as we could in the staff to get as full information on that site as we had obtained earlier in the fall on the other top sites. And those contacts included, in the Department of the Interior, the same bureaus; there are seven of them all together. It included the same Corps of Engineers and the Weather Bureau geologists whom we had been using in the 2 or 3 months previously on the other sites.

As to the pressure, I will definitely say that I exerted pressure upon Mr. Warner to work fast in getting a professional engineer to make a comparison of the two top sites. I do not know all the questions I asked him, but I asked him if this was a firm that he knew of, that he

had some confidence in. Were they reputable? Was a top man in that firm willing to put some personal attention to this? And did they have some cleared men, so that they could at least start off.

And, of course, we have the problem all the time. We have lists of firms in the country, formally or informally, but we have the problem of how much to load up those that we do have experience with.

We have done that in the case of a couple that I could mention. They never say no, but even though they are a big firm, they cannot give the thing we ask them the same attention, at such times, as a small firm or a newcomer.

Many firms, just because they have not done a job, apparently are not able to get work with us, because they have not done work with the Manhattan District.

The CHAIRMAN. There should be no monopoly.

Mr. SHUGG. I take full responsibility for Mr. Warner's selection. He gave me all the details, but I signed that contract. I wanted to have a top man in that company to give it his personal attention. I also wanted to know if they would use other consultants. And I personally suggested the firm of Alvord, Burdick & Howson, a Chicago water consultant who helped us at Hanford. That was the only experience I ever had with them.

They helped us to save money out there, and they kept us from making some possibly poor moves. So this firm was willing to use them and I probably dictated the use myself, because of my own work in the past with Alvord, Burdick & Howson. They also consented to a fair schedule, and the schedule was a good deal of our own doing. They did get their interim report in on February 7. That report in size was almost as fat as the present one, but it was not as fancy in some of the charts and the details.

The CHAIRMAN. What do you think of the price of \$3,000 for that job?

Mr. SHUGG. I think it was a bargain, sir, and that they hoped to establish one good job with us in the hopes of getting more. Different firms have used different means of trying to sell their services to us. I believe that is legitimate, if they wish to demonstrate to us—

The CHAIRMAN. Well, I do not know. I have my doubts about that.

Mr. SHUGG. I may have encouraged the low fee myself.

The CHAIRMAN. I would not want you to pay an exorbitant one. I am no expert on engineering fees, and I guess lawyers may be guilty at some times of the same practice. I do not know. But it does seem to me that \$3,000 is disproportionate for the amount of work involved here.

Mr. SHUGG. Of course, that is over and above every single expense, overhead and everything.

The CHAIRMAN. Yes; even at that, that would seem to me to be a very low fee.

You see, it is hard to suit Senators. If it was too much, they would be kicking at you, and now that it is too little they are criticizing you.

Mr. SHUGG. Yes, sir.

Their interim report was submitted on February 5. To check my memory, I asked one of their members here during the noon hour, and

I believe the only substantial change that he could think of in fact was in regard to the foundation qualities of the ground at Fort Peck. They changed that, he said. They had removed some of the poor comments submitted by some of the consultants on the Fort Peck foundation bearing qualities.

That report has a great many figures in it. Those figures in some cases could not be better than the promises which we gave to the engineer. It should be definitely stated by us, sir, that as to the amount of power, the amount of water, the amount of construction, those are order-of-magnitude estimates on our own part, because we have not yet designed the units that are going here. We had a choice to be very optimistic and say that we would only need a little bit of everything, and therefore be easily satisfied. But we have usually guessed short. We have never guessed long enough.

We set down figures there which were the largest guesses we could think that this thing might run into, because then it would be with those maximum assumptions that we would proceed. We felt it important to know whether some of these economical factors would over-balance some of the other judgment factors. If we knew what we were going to build there in detail, if we knew from where the materials were coming and who were going to be our contractors and suppliers, we would give better premises and assumptions to our engineers, and we would expect to give figures that would be much more reliable.

The CHAIRMAN. Mr. Shugg, that is all very interesting, but the fact remains, as Senator Hickenlooper has said, that you had a discussion with him in November, some time after the first of the month, and you informed him that it looked as though it was going to be at Fort Peck.

What happened after that, that definitely decided you to bring in an outside engineering firm?

Mr. SHUGG. I am not sure of the date that I informed him, sir. It was perhaps about the 1st of November.

The CHAIRMAN. We Senators can place things one way or another, as coming just before or just after—

Senator HICKENLOOPER. This was "just after." I was not back here until "just after."

The CHAIRMAN. You see, that is a little difficult, is it not? You tell Senator Hickenlooper it looks like Fort Peck and it is all decided. And that was done without benefit of outside engineers. It was done on the basis of your own staff work. Then, in the middle of winter, with 14 feet of snow on the ground, these people are brought in, in January, and they come back with a report that says: Pocatello. Just fill us in on that.

Mr. SHUGG. I meant my earlier reply to Senator Hickenlooper to indicate that as the reactor jobs themselves turn up—and I gave you the date of December 10 on that—we had some idea on what we were going to build there. That scaled down our water and power needs. At the same time they ran these other simultaneous inquiries. One, as I tried to make clear, was that this site, Fort Peck, was still at the headwaters of the Missouri-Mississippi Valley.

Another thing we had to satisfy ourselves of in staff work was that we had not gone down and substantially justified eliminating every one of the laid-up national military establishments.

The CHAIRMAN. You scaled down power needs. Were they scaled down measurably? Was that a big consideration?

Mr. SHUGG. I think a fair answer to that is that it was. I am not aware of the early survey assumptions that were used in May and June of 1948, when they had in mind a production plant comparable to one of our present big production plants. But this scaled it down, sir, because these units are a very small fraction of the capacity of those other units.

Then, in our own staff discussion—and this was not a constant thing; as I said, we had never been able to satisfy a substantial portion of our staff that we could not find a place where the problem of people would find a more satisfactory answer.

Senator MURRAY. Right there, Mr. Chairman, may I ask a question?

How did you arrive at the conclusion that Fort Peck would not be a satisfactory place and that you would have any difficulty in having people come there or having work people come there to help construct the project?

Mr. SHUGG. I can give you no facts or figures, sir. Mr. Johnston, who had worked on the Fort Peck Dam and who comes from either South Dakota or Montana—he married a Montana girl—was very enthusiastic about Fort Peck, and the report which Senator Hickenlooper spoke of was Mr. Johnston's personal effort, as a competent engineer, to help to substantiate Fort Peck. At that time, Pocatello was not on the list, and we had not asked Mr. Johnston, and he did not know of it. He did not know of the possibility of its availability.

I realize just how difficult it is to try to prove why we believe that the people problem will, over the course of 5, 10, or 15 years, sir, be more easy for us to handle at Pocatello than at Fort Peck. Fort Peck is isolated. I have not been there, but we have had personal experience with these isolated towns.

Senator MURRAY. You heard the testimony here today, with the witnesses describing the locality there and the recreational features that abound there and the wildlife and the climatic conditions, which compare very favorably with the other parts of the country; in fact, compare more favorably with Pocatello.

Senator HICKENLOOPER. Maybe it is not the right kind of "wildlife," Senator.

Senator MURRAY. Well, we can't offer the night-life of the big cities, but we have pictures here that were introduced this afternoon, showing what an attractive location this would be. We have everything that could be desired and I cannot understand how you would arrive at a conclusion, without ever having been there yourself or that you were going to have any difficulty about inducing people to settle in such a reasonably attractive area.

Mr. SHUGG. We had, as I say, the real experience of our own in handling somewhat similar isolated towns; and those people, not the construction people but the people whom we need to man the actual key operations of such a test site as this, were what we had in mind. It is semilaboratory work. It is not a production job. We have a good deal of contact with those people. They are on so many of our seminars and boards and are working at one contractor's or another's installation. And they are very vocal as to their preferences. They know our isolated towns.

Senator MURRAY. In Montana we have found all through our history, there, that people who have lived in the very highest developed sections of the country, men of excellent education and refinement and high qualifications of every kind, have come to Montana. Teddy Roosevelt came out there in the early days, and some very distinguished eastern people came out there, established ranches and lived in those areas in apparent comfort. Many rich and cultured people from the East come out there and buy ranches and go into the cattle business and seem to be entirely satisfied in that western atmosphere out there and that healthful section of the country. So I cannot understand why you should arrive at the conclusion merely based on the fact that you have had difficulties in some other sections of the country.

Mr. SHUGG. I cannot prove it either, Senator, but I did that in an effort to clear away some of the apparent lack of firmness in this, feeling that we should put in everything that counted; and this matter of people was one of those things which did count.

The CHAIRMAN. Mr. Warner, I do not want to pursue this thing too far, but I am going to ask you again: Just why did you pick this firm? I want to have that clearly in the record. Why did you pick this outfit?

Mr. WARNER. This firm had a national reputation.

The CHAIRMAN. That is one.

Mr. WARNER. It had top-notch people, qualified in this sort of a problem.

The CHAIRMAN. Who told you that?

Mr. WARNER. That was gathered by talking with people here in Washington, with Cook and with others.

The CHAIRMAN. Who?

Mr. WARNER. Mr. Cook, at Oak Ridge, R. W. Cook, whom I mentioned before.

The CHAIRMAN. And "others?" Who are the others?

Mr. WARNER. Well, sir, I can't tell you who the others were. There is a certain element of judgment. I had known of them for some time, although I had never had any connections with them. I had known of their work, the job they had been doing.

The CHAIRMAN. Did you know any of them personally?

Mr. WARNER. No, sir.

The CHAIRMAN. You say "Cook and others," but you cannot remember who the others were at the moment. That may occur to you later. What was the third qualification? They had cleared people?

Mr. WARNER. They had cleared people that were available.

The CHAIRMAN. That were not on any other work, people who were available?

Any other reason that occurs to you?

Mr. WARNER. Those are the ones that occur to me at the moment.

The CHAIRMAN. Those are the ones that occur to you. Does this method of selection conform with the contract manual of the AEC?

Mr. WARNER. The contract manual was issued subsequently. Let me see. For purposes of getting a report, I think there is certain latitude there. As to selection, there is no particular regulation that would cover that, for purposes of getting a report.

The CHAIRMAN. But there is on other contracts with the Commission?

Mr. WARNER. For contracts involving the execution of work, the design of construction and costs.

The CHAIRMAN. There are definite regulations. But there are no regulations in the Commission as to the instruction of engineering personnel. Am I to understand that?

Mr. WARNER. For the selection of people to do a job of making a report. I am sure that for the selection of an engineering firm for design the answer would be "Yes."

The CHAIRMAN. But simply to get a report, "No."

Mr. WARNER. Simply to get a report of short duration, "No."

The CHAIRMAN. How many other firms have you hired to do this kind of a job or a comparable job?

Mr. WARNER. Well, I have had a hand in a good many, I suppose, in the last 5 years.

The CHAIRMAN. But there are no regulations that govern it?

Mr. WARNER. For doing a report?

The CHAIRMAN. Yes.

Mr. WARNER. No, sir; not that I am aware of.

The CHAIRMAN. How much money does the Commission spend a year in getting reports?

Mr. WARNER. I would have to ask Mr. Shugg. I am not aware. We have a limited number of consultants.

The CHAIRMAN. A limited number of consultants. Well, do these classify as consultants? This list here?

Mr. WARNER. They would be used in a consulting capacity, certainly. That is the service that we wanted.

The CHAIRMAN. Well, now, let me see if I understand. We have a contract manual that is approved by the Commission, which lays down the way that you should go about selecting contractors. That is true, is it not? You do have such a manual?

Mr. WARNER. Yes, sir.

The CHAIRMAN. In this case, the regulations were not followed? Is that true? In the selection of this firm?

Mr. WARNER. This manual was not in effect at the time, sir, I believe.

The CHAIRMAN. Let us see. When was this manual adopted?

Mr. WARNER. It has been under discussion for about a year, but I am not sure.

Senator JOHNSON. Did it replace a previous manual?

Mr. WARNER. No, sir.

Senator JOHNSON. It is something entirely new?

Mr. WARNER. Yes, sir.

The CHAIRMAN. In other words, this is a new procedure?

Mr. WARNER. Yes, sir.

The CHAIRMAN. What is your best judgment as to when it was adopted?

Mr. WARNER. My thinking would be that it would be in January, offhand. I know it has been under intense discussion during the autumn, various parts of it.

The CHAIRMAN. In your experience with the Commission, is it in accordance with the usual policy for one man to do the selecting of the firm to do a job of this kind, whose recommendation is going to carry the expenditure of half a billion dollars?

Mr. WARNER. Sir, this is the report where the fee was \$3,000. The total amount of money allocated for this report was \$50,000.

The CHAIRMAN. I do not quarrel with that, but my point is this: Their report evidently determined in the minds of the Commission the expenditure of half a billion dollars. It apparently determined the location. I just want to get all these facts in the record. This is not by way of criticism. I want to find out the truth. The point that I want to make is this: Is it the usual thing in the Commission for a contract to be made with a firm to accomplish work which is so fraught with consequences as was this contract? Is that the habit, the custom, of the Commission, or is it not?

Mr. WARNER. The Commission certainly makes the decision. As far as the selection of a report goes, or the selection of people to write a report to provide information—

The CHAIRMAN. That rested solely with you?

Mr. WARNER. Yes, sir.

The CHAIRMAN. Have you been alone in selecting other contractors for the Commission?

Mr. WARNER. As to any contracts involving sizable sums, of course, they go through many hands and contractual boards, and most of them are handled in the field.

The CHAIRMAN. So this, to that extent at least, is an exception, then, is it not?

Mr. WARNER. Certainly.

The CHAIRMAN. And you would justify the exception on the ground that it was a peculiar job that was being done; namely, a research job rather than a design job.

Mr. WARNER. I would say it was a fact-finding job and the selection of consultants for a fact-finding job takes on a different connotation than selecting contractors to design something and build something.

The CHAIRMAN. I must say that I cannot agree with the conclusion, because it presupposes that it is of less importance to have a careful review of the qualifications of a fact-finding contractor than of a design contractor. While the design contractor is certainly very important, the fact-finding contractor was extremely important in this case, because it apparently has determined the Commission's judgment as to where half a billion dollars are going to be spent.

Mr. WARNER. Mr. Chairman, if there had been time, the Engineering Division of the Atomic Energy Commission would have made this study. It is a question of bodies able to pick up information.

The CHAIRMAN. Thank you.

Any further questions?

Senator ECTON. Mr. Chairman, I would like to ask Mr. Shugg if his Division is aware of the fact that at Fort Peck Dam there are many engineers who live there the year-round, and that at one time they had 11,000 men working there at Fort Peck.

Mr. SHUGG. Yes, sir. I am aware of that. Because I talked that over with Johnston, who is one of our men, who was on the Fort Peck job. And Johnston's opinion and our own, sir, is that Fort Peck is a good site. It is, in fact, the second best site in the whole country, to the best of our knowledge today. But it was our considered opinion that Pocatello was simply better. The job can be done at Fort Peck, sir.

Senator ECTON. Then, for recreational facilities, it is only about 8 hours from Glacier National Park. Do you also realize that the Fort Peck area is only 8 hours from Glacier National Park?

Mr. SHUGG. Yes, sir. I do not wish to overemphasize this "people" business, but it had not been mentioned before, and I wanted to be fully responsive to the question as to the factors involved and the reason for this switch from Fort Peck to Pocatello; or what is apparently a switch, because we have very frankly said that Fort Peck was at the top of the list, until some time in the middle of the fall. I mentioned that factor of where people prefer to live simply to fully answer the question as to what all of the things were that led to this change.

I think, sir, that there is not any question, if we had to have two sites and they had to be far distant, one from another, that everything we have today would tell us that the other site would be Fort Peck. But we have to make a decision on one site, and in the Commission's judgment, although Fort Peck is a good site, we do believe that Pocatello is a preferred site. In many of these factors, both are stated as good; power is good in both places, and water is good in both places. But, as I said, we do believe that Pocatello is a preferred site.

Senator ECTON. Have you ever had the privilege of visiting that Fort Peck area. You, yourself?

Mr. SHUGG. No, sir; but I have been at Billings, and I like Billings a great deal, and I like the western country.

Senator ECTON. We appreciate that you got into Montana as far as Billings. But it seems to some of us that you engineers who determine these sites should visit them. We just feel that you should visit them and inspect the possible sites personally, so that you at least know what these engineers are talking about when they make these surveys and recommendations. I am very sorry to learn that you have not gone out there and investigated that Fort Peck area.

Mr. SHUGG. That is true, sir. I have not been there. And I imagine also that I would have to spend some little time there, in the event that my first quick landing was under conditions which every site has, at one time or another, conditions that were not good. I could not prejudge on the basis of one visit. It would depend on the time of year and other things.

I have flown through Miles City, for example, many times, because I made 26 flights across Montana in the calendar year 1948, all of them by Northwest. I have not been in Pocatello either.

But I do not want to leave the impression that this is a personal preference. We had to be careful, here, to keep some of these things from getting an unbalanced judgment as to the over-all. There are 14 factors, all together.

Senator ECTON. I think all of us appreciate the fact that you and the other members of this Atomic Energy Commission have taken into consideration and evaluated all of the necessary qualities in a site. That is the way I want to look at it. But we were discussing this one principal thing, and I did want to call this very pertinent fact to your attention.

Mr. SHUGG. And I do not wish to overemphasize that matter of people. It is the only thing that had not come out on the table here, and it is tucked into some of the fancier words like "social factor,"

and so forth, in our 14 criteria. But I think that is one of the things which help in the final decision, in our judgment, aside from any pages of dollar figures and facts. It is one of the things, sir, that did influence our judgment in selecting Pocatello as the better of the two; with full recognition that Fort Peck is a good site, the second best that we could find in the whole country.

Senator ECTON. Well, we appreciate that; and if we are left out this time, we hope that if there is any necessity for future development you certainly will not overlook that area in the future.

The CHAIRMAN. Thank you very much, gentlemen.

Mr. SHUGG. Mr. Chairman, may I introduce for the record about four pages which very briefly summarize the much longer testimony which we gave before the joint committee in executive session?

The CHAIRMAN. Certainly.

Mr. SHUGG. As the committee will recall, the subject of the selection of a site for the reactor-testing station was considered on March 14 with the joint committee in executive session. I propose to review here the steps taken and the considerations involved in this matter, in a way that this can be done in a public hearing.

Before outlining the steps which the Commission has taken in selecting a site for the reactor-testing station, I would like to review briefly the significance and purpose of this project.

Nuclear reactors are the key to the future promise of atomic energy both for military and peaceful purposes. These uses include the production of fissionable material, development of power, propulsion of naval vessels and aircraft, and production of radio isotopes for use in research and in medical therapy and industrial processes.

In order to insure the preeminent position of this Nation in the field of atomic energy, it is essential that new types of reactors, differing from those presently existing, be developed and put in operation as soon as possible. The Atomic Energy Commission has concluded that in order to press forward with the development of new reactors in a manner compatible with public safety and welfare, acquisition and development of a new remote testing site is necessary.

The test station will be essentially a field facility for testing and proving for the entire national reactor-development program, while research and development activities continue at existing installations. Participating in this project will be Commission research units working on reactors, armed forces agencies concerned with military utilization of reactors, and industrial groups working on problems for the Commission in this field.

During the first half of 1948, the importance of the development of a separate reactor-testing station became increasingly apparent to representatives of the Commission, advisory groups, and others engaged in the reactor-development program. All known factors related to the subject were considered by staff members in the light of the objectives of such a program, and a general statement of criteria for the site of such a station were developed. These criteria, which were later refined and developed in the course of further study, provided in general that the site for a reactor-testing station should:

1. Be removed from heavily populated and industrialized areas.
2. Be near enough to existing communities so that construction and operating personnel can be accommodated.

3. Contain at least 400,000 acres of land, preferably of submarginal value for farming and ranching and not suitable for future agricultural, mining, or other development.

4. Be near a readily accessible reliable water source that would supply continuously a minimum of 50 cubic feet per second.

5. Have geological, hydrological, and meteorological conditions facilitating the handling of radioactive wastes under normal and emergency operations.

6. Be near an electric power source that will be capable of supplying a minimum of 70,000 kilowatts at a reasonable cost.

7. Be amenable to acquisition and development with utmost economy.

The Commission representatives then undertook an extensive study of possible sites throughout the entire United States for a testing station which might meet the requirements of the program. In the course of this study, representatives of the Corps of Engineers, the United States Air Forces, the United States Army, and the Commission staff made systematic studies and surveys to produce, for initial consideration, areas of the country deemed to be generally eligible. These surveys, which included Federal and State parks, military installations, other appropriated or marginal publicly owned lands and privately owned lands, revealed 70-odd areas throughout the United States that met the general specifications at least in part. Sites in 34 different States were examined. Among these areas, 23 warranted detailed studies. These further studies showed that seven areas had desirable characteristics. The Commission staff, therefore, with the assistance of the Department of the Interior, the Department of Commerce, and the National Military Establishment made additional detailed studies of these seven areas.

Following an analysis of these studies, the Commission on January 6, 1949, employed the firm of Smith, Hinchman, & Grylls, Inc., Detroit, Mich., to conduct a comparative evaluation of the two of the seven areas having the greatest potentialities, Fort Peck, Mont., and Arco, Idaho. This survey was designed to develop additional detailed information and to present a systematic comparison of the advantages and disadvantages of the two sites. In this final analysis, the Commission staff and the engineering firm used the reports of specialists in geology, hydrology, meteorology, and sociology and further refined the requirements. These refined requirements included considerations of isolation, security, climate, geology, nature of soil and drainage, water supply, potential availability of manpower, availability, accessibility and cost of materials and supplies, nearby town and community developments, construction and operation costs, availability and cost of electric power, and fuel sources.

The engineering firm concluded, after studying the characteristics of the two areas and measuring these characteristics against the refined requirements, that the Arco area was equal to the Fort Peck area in 2 respects, superior in 11, and inferior only in 1 respect.

The findings of Smith, Hinchman & Grylls were incorporated first into an interim report dated February 9, 1949, and later into a final report of some 150 pages with an appendix of 120 pages more, containing consultant reports. This report presents a detailed analysis with charts, maps, and tables of the extent to which the two sites met the requirements listed above.

The Atomic Energy Commission then reviewed the findings of its staff, and the information obtained from the firm of Smith, Hinchman & Grylls, Inc., the Department of the Interior, the Department of Commerce, and the National Military Establishment. It gave additional consideration to certain special requirements, particularly those relating to hazards, security, and drainage. The Commission then reached the decision that the Arco area was the preferred site and authorized its staff to initiate discussions for its acquisition. These discussions are now under way.

It is the view of the Commission that Pocatello is clearly the site best suited to the requirements of its reactor-development program. The Snake River plains area, the selected site for the reactor-testing station, northeast of Arco, is adequately removed from heavily populated and industrialized areas, and at the same time is close enough to communities where construction and operating personnel can be accommodated. Furthermore, it has a desirable combination of geological and hydrological features which will facilitate the handling of radioactive waste under normal and abnormal conditions. Despite the great care and precautionary measures which will be taken at this station, as at other Commission installations where safety records have been outstanding, the Commission must always consider the possibility that harmful materials might be released over an area of several square miles by major accidents such as fires or spills.

At the Arco site there is no surface drainage directly to the Snake River, which is 40 miles away, and, furthermore, the porous soils would absorb the harmful materials. Percolation through the water table to the Snake River will take many years. During this interval the materials would lose a great deal of their radioactivity by the natural process of radioactive decay.

In connection with the other requirements, the selected site is underlain by an extensive water table through which flows between 1,000 and 2,000 cubic feet per second of good water. This area also has thousands of acres of level land on which can be readily developed necessary facilities for the testing station and, in addition, possesses an adequate and economical electric-power source, as well as good access roads and railroads.

Senator TAYLOR. Mr. Chairman?

The CHAIRMAN. Yes?

Senator TAYLOR. I do not want to take up your time. I know how busy you are and how busy all of us are.

I simply would like to ask, in case the question of reopening this matter, with the possibility of relocating the plant, should be seriously considered in the wisdom of the committee, if Idaho will be given an opportunity to testify at some future time.

The CHAIRMAN. All right, Senator.

Senator HICKENLOOPER. That is very understandable, Mr. Chairman, and I am for it. Because if anybody dares say any of these States is better than Iowa, I want to be able to take the stand and testify. And I will also suggest that that goes for Connecticut.

Senator MILLER. Just for the sake of the record, I would like to be heard for about  $2\frac{1}{2}$  or 3 minutes on the testimony that has been adduced here.

The CHAIRMAN. Surely, Senator.

Senator HICKENLOOPER. I wonder, Senator, if you would withhold that for just a moment. I want to ask Mr. Shugg one question, if I may, and then I will be through, if you will indulge me for just a second, here.

I believe you stated, Mr. Shugg, in an executive session of the Joint Committee, inasmuch as you are putting in a summary of your testimony in the executive session, on March 14, referring to this engineering survey, as follows:

"We had a preliminary report from them"—

That would be the engineers?

Mr. SHUGG. Yes, sir.

Senator HICKENLOOPER. "On the 5th of February, and the final report is not in yet." That was on March 14, 1949. I believe that appears in the testimony.

I may say parenthetically that at that meeting I was under the impression that the final decision had not necessarily been made. I cannot say that it was actually said. I do not mean that, and I may have gained an erroneous impression.

Mr. SHUGG. I certainly would not want to give that impression, sir.

Senator HICKENLOOPER. I do not want to say that that was said, but I was laboring under the impression that the Pocatello site had not been finally determined upon, because the engineering reports had not been finally in at that time.

Mr. SHUGG. All the basic data were in that February 5 report. It simply wasn't prettied up.

Senator HICKENLOOPER. Yes. I see. Excuse me, Senator.

#### **STATEMENT OF HON. BERT H. MILLER, A UNITED STATES SENATOR FROM THE STATE OF IDAHO**

Senator MILLER. My name is Bert H. Miller, Jr., Senator from Idaho, with office in the Senate Office Building.

I preface my remarks with the observation that I have known this particular section of the State of Idaho for a period of time dating from before many of the witnesses, or some of the witnesses, were born, and which would be not less than 55 years.

Back in 1916, I made somewhat of an investigation as to sinking wells, because at that time I had more or less of a personal ambition to go into the cow business and figured that that would be a mighty favorable section to do that, assuming that water could be obtained through wells in the place in which I desired to locate.

It will be remembered that Idaho is a land-grant State. I am further familiar with the tracts, for the simple reason that I think it was in 1942 that the Aeronautical Corps sought a tract of land 30 miles wide by 60 miles long in that vicinity as a bombing area. And I, as attorney general, at that time was a member of the Constitutional Land Board, and, as you recall, there was ceded to the State as the result of statehood two sections of land in each township.

I recall distinctly the suits being brought by the United States of America against so many thousand acres of land, to condemn it because of the price that existed for these school lands, which was under the constitution of the State, \$10 per acre.

The Government took the position that they could not afford to pay that much and if, through condemnation proceedings, they could get it reduced, that is what they would attempt to do. We would have been perfectly willing to have deeded to the Government; but the Government, of course, would not accept it on that basis, because of the price fixed by the constitution and the invalidity of a deed conveying the land for a less amount than what the constitution provided for.

As I understand, the atomic energy set-up here wants about 400,000 acres. The amount that in my recollection the Navy has there at the present time is probably slightly in excess of 200,000 acres. I am not certain as to that. The amount is immaterial.

Mr. SHUGG. It is 173,000.

Senator MILLER. I see. I am guessing at this, from about 10 years back.

I particularly wanted to make mention of the testimony of the first witness here. I do not recall what his name was, because I did not get it. I wanted to mention his testimony and his fear that the Idaho Power Co. may go broke because of furnishing Idaho Electric Power beyond what they can really afford to provide. Well, we need have no fears about that situation.

I might say that mention has been made of a statement of some health officer. I understand the witness to say that he was from Idaho. If so, I never heard tell of him around the statehouse, and I only left there last December, after a constant sojourn there for 16 years. His statement that the engineers testified or reported that there was sewage contamination in the water there is absolutely foreign to anything that could possibly be true with respect to the location of this atomic energy plant. In the first place, there is no habitation near there, Mr. Chairman, save and except a remote ranch within a distance of probably 100 miles, coming in that direction. And the only town of any consequence would be in Senator Murray's State, the town of Dillon. So you have some idea as to that distance.

There is the little town of Dubois probably 50 miles away.

Senator MURRAY. How about Idaho Falls?

Senator MILLER. Well, Idaho Falls does not come within that area.

The natural trend or fall of the land is toward the southwest. Arco and that section of the country is at a lower altitude than is the place where there would be any atomic energy buildings or plant. So it could not come from that source.

Another thing is this, to show the inconsistency of such a thing:

Those thousand springs that were mentioned have been there since the first traffic ever came out into Idaho, and that was a long time ago. They have never varied, even though there are wonderful irrigation activities now in the vicinity and in the same general trend as those springs. They have not increased or diminished.

The Idaho Power Co. has one of its plants there; power from a thousand springs. There is room for ever so much activity there, in that respect, if they ever wanted to do that.

I will say this: The biggest private fish hatchery in the Northwest is situated under these springs. The Government of the United States has the largest Government hatchery in the Northwest, situated under these springs.

It is only reasonable to conclude that it would make an active test as to what the situation is there with respect to the purity of that water.

We speak about Pocatello. If what I read in the press is true, Pocatello is the second largest town in the State of Idaho. At a closer distance to where the construction will be is Idaho Falls, the third largest town in the State of Idaho. Both of these towns are in the eastern or southeastern area of the Snake River, which passes down through there; so it could not be said that there is any contamination over in that vicinity, from that point.

I mentioned the fact that these thousand springs have not varied from time to time. That is due to the fact that they are undoubtedly deep springs. Nobody knows how deep they are. It is true that it is in the vicinity of a Government park, the Craters of the Moon, but that does not spoil it for any particular reason.

Those are some of the observations that I wanted to make in connection with those particular areas: That there absolutely can be no contaminated water in the vicinity of the wells that would be dug, if any are dug, for this atomic energy location or plant; and that you will find a situation there that is freer from objectionable conditions than would be found in most any other spot that I know of, either in the State of Idaho or of Montana, because I know quite a lot about Montana, too. I was a buckaroo up there, Senator Murray, right in the country you are talking about.

Of course, my opinion on it has nothing to do with the intrinsic value, but I cannot see how it would be possible for anyone who has made an investigation of those two sites, considering climatic conditions, freedom from wind, freedom from this, that, and the other, to move this plant to the vicinity of Fort Peck, when they have such a place as they have out there, near the Big Butte in the Arco country.

The CHAIRMAN. Thank you very much, Senator.

Now, gentlemen, it is 5:20. We must get back to our offices. We will continue this hearing at the call of the Chair, probably the first of next week. We will examine the engineers, among others.

Senator MURRAY. Mr. Chairman, the witnesses that are here from Montana may be excused?

The CHAIRMAN. Oh, yes, surely.

I want to say to the witnesses from Montana before they go that the committee thanks them for coming and for stating their views on this matter. They have been stated, within the limitations that we laid down at the start.

I particularly want to thank Mr. Mansfield and the Governor for their presentations, and also the other members of the delegation for their presence and interest here.

I will say to Senator Taylor and Senator Miller that they will have an opportunity at a future hearing to offer any testimony they wish to offer.

I would urge you not to go out and get chamber of commerce witnesses; not, again, that I have anything against them, but, after all, you are standing on a decision that has been made by the Commission. Suppose you reserve that until after we have heard from the engineers. Then we will be glad to talk to you gentlemen again about it.

I am not going to string this out. We cannot do that. We cannot meet against this week, either. We will notify you when we will have another meeting. It will probably be Monday or Tuesday. We will endeavor to let you know tomorrow.

In the meantime, I would suggest, Governor; that you go home. I do not mean by that to be discourteous. I mean, by that, that I certainly would not want you to wait, because I certainly think you have done all you can.

Governor BONNER. Thank you, Mr. Chairman and gentlemen of the committee, for your kindness in holding this meeting. I must get back to Montana, because of pressing State duties there.

But, in leaving, I just want to say this to the chairman of the committee: I believe the evidence that was adduced here today well shows why Montana was upset about this proposition. As was testified to here by the several witnesses today, I did make a trip to Washington some time ago. I met the President of the United States and others that were interested in this project. That was in March. And nothing was said about this matter being decided.

We then went down to meet with Mr. Lilienthal and Mr. Warner. After at least one-half hour's discussion of the merits and demerits of the two sides then, and then only, did Mr. Lilienthal state that it had already been decided on March 1.

In making that statement, Mr. Chairman and members of the committee, I want to say this, without reservation: that we pressed Mr. Lilienthal as to why no one knew about this prior to this date, and Mr. Lilienthal replied that it was due to the fact that the Navy did not want it released.

Therefore, I was startled today to hear Mr. Warner testify that the only reason it was not released was due to the fact that it was used as a bargaining point. That is what has had us upset in Montana all the time, trying to put our finger on something.

Sometimes we think it is here, and then we find it is over here.

Another observation I would like to make to the chairman and to the committee before I leave is that, while Fort Peck was the No. 1 site up into the fall, then this firm of engineers was appointed and within a month they came back, in the dead of winter, and the Commission decided the matter within that time; that is, in February.

I think, too, in fairness to everyone, that I should cite the fact that Mr. Warner testified that this was a fact-finding engineering firm; and yet our great railroad out there, the Great Northern, had a representative testify here today that the Great Northern was not even asked about freight rates.

Those are some of the questions that are in the minds of the Montana people.

We, as I stated this morning, are not against Idaho in any sense of the word, but we feel, in Montana, that we are entitled to it on its merits. And when we mention Idaho, with due respect to the Senators, we are like Idaho; we have a great "reach" for our State, this great State of ours. And it is admitted by the Commission that, in order that this plant go ahead in Idaho, it must get power from Montana, particularly power from the Montana Power Co., south from Butte.

We want to put this on its merits. And again I want to thank the committee. And I respectfully urge that, if there is any doubt, the matter be reopened and this plant given to the State which deserves. We think that State, of course, is Montana.

We cannot understand how we can be No. 1 priority late in the fall and then have an engineering firm come in, and then find that within a month the question is changed.

In closing, let me say this again, Mr. Chairman: When we were discussing the matter with Mr. Lilienthal, after a half hour it was stated by Mr. Lilienthal at that conference that the men hired were scientific people, professors, and that they would like to live in Pocatello rather than in Glasgow. And, when I asked Mr. Lilienthal whether or not that was the basis of the decision, he said, "Governor, I should not have said it that way."

Now I know that Idaho has a fine resort, Sun Valley; but, as Montana Governor, I think that the matter should be settled on its merits, and not on the recreational facilities for the professors.

As Senator Murray pointed out, we have recreational facilities in Glasgow; but it has always been my philosophy of life that if you are interested in a thing you should go there and work. That is the way we feel in Montana, and I know that is the way the other States feel.

Again, this is the first time that I have seen the Idaho Representatives, outwardly at least, contending for the State of Idaho.

When I was here in Washington, I was startled by the fact that the Sunday night before I met Mr. Lilienthal there was no Idaho pressure; it seemed like the thing was cut and dried.

The CHAIRMAN. I think that is exactly right.

Governor BONNER. So this comes out here for the first time today.

The CHAIRMAN. I want to make an observation, Governor. I think you have now stated something that is rather favorable to the Commission's selection; in other words, that there was no political pressure of any kind, character, or description. It has been a selection without that kind of attempted interference.

Of course, this hearing has been called by the joint committee, again I say, at the request of the Montana delegation and yourselves. And naturally the Idaho Senators are here because they are now in a position of not wanting to see the thing reversed.

Governor BONNER. Oh, I do not blame them for being here.

Senator TAYLOR. Mr. Chairman, may I say that we did not interfere in this matter. We felt that it was a matter above and beyond politics; that it should be decided on its merits. And we did not take any action at all until we heard that the Montana delegation was trying to make it political.

The CHAIRMAN. Thank you very much, gentlemen.

(Whereupon, at 5:55 p. m., the committee recessed to the call of the chair.)

## SELECTION OF SITE FOR REACTOR TEST STATION

TUESDAY, MAY 10, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The committee met at 2:30 p. m., pursuant to call, in room 324, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon (chairman), Representative Durham (vice chairman), Senator Hickenlooper, and Representative Price.

Also present: Senators James F. Murray, Montana; Zales N. Ecton, Montana; and Bert H. Miller, Idaho; Representatives Frank A. Barrett, Wyoming; Mike Mansfield, Montana; Wesley A. D'Ewart, Montana; and Roy W. Wier, Minnesota; William L. Borden, Executive Director; Harold Bergman, Deputy Director; and E. L. Heller, staff member, Joint Committee on Atomic Energy.

The CHAIRMAN. Let us come to order, gentlemen.

You will recall that at the last hearing we heard the representatives of the State of Montana in a morning and afternoon session in their presentation on the desirability of going to Montana instead of to the State of Idaho with this project.

You will also recall that the chairman expressed what I think is the unanimous viewpoint of the committee: namely, that we are not a site-selecting committee and that our function, in this particular matter at least, is confined to the examination of the matter on two scores. First, was there any undue influence or corruption that could be alleged—which, of course, no one has suggested in the slightest degree—or, second, is it such an obviously improper and bad choice as to indicate choice “by guess and by golly” and by whim and caprice?

Speaking now only for myself, of course, the evidence that has been adduced so far has indicated neither of those conditions. I merely reiterate that, so that we can keep this thing within the confines and the bounds of good practice, and within the bounds of what we, as a committee, should seek to do.

You will also recollect that at the last session I suggested that the engineering firm of Smith, Hinchman & Grylls, who, it was testified, were retained to make a survey, be invited to come here for the purpose of making such observations as they care to on the allegations that were made by the Montana witnesses regarding two or three salient points in their report.

It is only fair to the Montana people and fair to this engineering firm that they have an opportunity to do so.

Wallace S. MacKenzie, Mr. Borden tells me, is here from that engineering firm. Mr. MacKenzie, would you come up here?

I might say that Congressman Barrett, from Wyoming, is here in person, and he has asked for an opportunity to present to the com-

mittee reasons why we should all solve this situation by placing it "in the middle"—in other words, in Wyoming.

Representative BARRETT. That is right, a compromise, Senator.

The CHAIRMAN. Mr. Barrett, would you care to proceed first?

**STATEMENT OF HON. FRANK A. BARRETT, A REPRESENTATIVE  
IN CONGRESS FROM THE STATE OF WYOMING**

Representative BARRETT. I would appreciate it, Senator McMahon. I am Frank Barrett, a Member of the House from Wyoming.

Of course, we in Wyoming make no charge, Senator, that this site was selected by any undue influence of any kind or character or that, indeed, we could prove caprice in the matter. We do think that there are many reasons why a site along the Union Pacific Railroad in Wyoming would certainly in many respects be the proper one.

In the first instance, we have a site there of some 400,000 acres of land that is immediately adjoining one of the main transcontinental railroads of the West, with good highways; and they have sufficient water to supply the needs of this reactor plant.

The fact of the matter is that any water that might be available from the Snake River in Idaho comes from Wyoming, originates in the State of Wyoming, and we could divert it over and use it for this purpose if need be.

In addition to that, Senator McMahon, I would like to say this: Of course, I do not know anything about the end results of this plant or of the civilian uses that might eventually be found feasible, but in that section of Wyoming we do have many natural resources in abundance that I think might well be used along with this plant.

In the first instance, we have tremendous deposits of coal. About 9,000,000 tons are mined right in that area each year. We have tremendous gas fields that will supply a great area covering several States right in this area around Green River. In addition to that, we have the biggest shale deposits in the United States right there, and the Government itself has a plant a few miles over the State line in Colorado, in which it is estimated 120,000,000,000 barrels of oil will eventually be extracted.

And so, with all of these combined together, if any civilian uses are made of atomic energy in the years that lie ahead, certainly that would be a spot where great natural resources are centered.

Now, we have power in abundance in several areas in Wyoming, not far from the site at Green River. Of course, we hope to have the upper Colorado River Basin developed, and several new power dams constructed.

And so it does seem to us that maybe the engineering firm might well take another look at the situation over there; and, as the Senator has well said, in order not to have too much in the way of hard feelings between Idaho and Montana on this matter, they could compromise by locating it in Wyoming. I think, if they did so, there would be no mistake made.

Thank you very much, Senator.

The CHAIRMAN. I understand that Mr. Wier, a Congressman from Minnesota, would like to speak to the committee.

Mr. Wier, out of congressional courtesy, I think you should go ahead now, unless you want to wait. I will leave it up to you.

**STATEMENT OF HON. ROY W. WIER, A REPRESENTATIVE IN  
CONGRESS FROM THE STATE OF MINNESOTA**

Representative WIER. I would like to get away now. I want to get over to the House on a bill.

Mr. Chairman and members of the Atomic Committee, I have been watching this, and I am sorry that I did not get in on these hearings previous to the indication of a decision for Idaho.

I represent the Third Minnesota Congressional District, which is largely made up of a major part of the city of Minneapolis, as well as five rural counties, and we have a natural interest in this development, or this project, and I would feel derelict in my duty if I did not come over here and speak for the people that I represent.

Sentiment is very strong in our State, our whole State, I think it is safe to say, on the development of this project in the State of Montana. Personally, I think we can all agree that that great State of Montana has everything that nature has to offer humanity in the way of natural resources. I think Montana is the most diversified State in every approach to God's resources of any of the States of the Union. I think all of the arguments that have been made here for any of the other States are just as applicable to the State of Montana.

And briefly, I just want to submit to this committee, and for the record, that Minnesota is very much concerned, and very hopeful that this project will be considered in the light of real consideration for the State of Montana.

The CHAIRMAN. Thank you.

Senator MURRAY. Mr. Chairman, on behalf of Montana I want to thank the gentleman for his remarks. I think he has stated very correctly that Montana has the most diversified resources of any State of the Union. It has all of the requirements necessary for a plant of this character.

While I am speaking, I might say also for the record, in answer to the Congressman from Wyoming, that there is no bitter conflict between Montana and Idaho with reference to the location of this plant. We are not quarreling with Idaho. There is no feeling whatever in this matter. It is only a question of determining where this plant should properly be located. And I think that the facts already brought out by this committee at the last hearing, and the subsequent proof that has been submitted to the committee, demonstrates that Montana is the logical place for it, and that the engineering firm that made the investigations did not give due regard to the facts which justify its location in Montana.

The CHAIRMAN. Thank you, Senator.

Now are there any other Members of the Congress who wish to make an observation?

Representative MANSFIELD. Mr. Chairman, I would like to have the privilege of being heard for the last 10 minutes this afternoon.

The CHAIRMAN. After we finish with the engineering witnesses?

Representative MANSFIELD. Yes, sir; and after all the questions are asked.

The CHAIRMAN. Yes, Mr. Mansfield, we will be glad to do that.

Mr. MacKenzie, you are to speak for the engineering firm of which you are a partner? You may remain seated if you want to.

**STATEMENT OF WALLACE MacKENZIE, PRESIDENT, SMITH, HINCHMAN & GRYLLS, CONSULTING ENGINEERS, DETROIT, MICH.**

Mr. MACKENZIE. We are a corporation, and I am the president of the corporation.

The CHAIRMAN. You are Mr. Wallace MacKenzie?

Mr. MACKENZIE. I am. And I am the president of the corporation.

The CHAIRMAN. It is a corporation?

Mr. MACKENZIE. Yes, sir; it is a corporation.

The CHAIRMAN. All right, Mr. MacKenzie.

I take it that you have covered the testimony that was given here in the previous hearing.

Mr. MACKENZIE. Yes.

The CHAIRMAN. Would you like to make some observations on the questions that were raised?

Mr. MACKENZIE. I don't believe so, in any particular.

I have with me here, Mr. Grubb of our company, who was our man who headed up this investigation for the Atomic Energy Commission, and who is very familiar with every point involved, and gathered the information as it came in from the field, and I would rather that he would answer in any detail.

The CHAIRMAN. Before we do that, Mr. MacKenzie, I would like you to qualify your organization as to its qualifications for doing this job. Will you do that, please?

Mr. MACKENZIE. Yes. I have a written qualification here, which I can leave with the committee. But we are an architectural engineering firm who have been in business for approximately 35 years, and have during that time, of course, done many hundreds of millions worth of varied construction work, including, during the war, seven large ammunition plants, for the Ordnance Department.

We are at present engaged in designing the new technical center for General Motors in Detroit.

The CHAIRMAN. You are a Detroit organization? That is your home base?

Mr. MACKENZIE. We are a Detroit organization, yes. But we have been doing work throughout the United States and also in Canada and Europe.

We have considerable experience in the field of chemical engineering. I include in that class distilleries, for example. We designed and built the Hiram Walker distillery out in Peoria. We also designed a large distillery for them in Dumbarton, Scotland.

We have for the last 10 years done all the engineering work for Joseph E. Seagram & Sons, Inc. We have done work for other distilleries, including the Fleischmann Co.

I mention this specifically because of the process, the nature of the work, in which we not only engineer the buildings themselves, but the process equipment that goes into them, and in many cases the selecting of the site for the plant.

Senator MURRAY. You do not mean to infer that the products are of an explosive character, do you?

Mr. MACKENZIE. I think they are, in more ways than one.

The CHAIRMAN. Have you ever done any work for the United States Government, with the exception of the seven buildings that you designed during the war?

Mr. MACKENZIE. Oh, yes. We have done considerable work for the Government. In the First World War we did a great deal of work in design of gun carriages, and so on, as well as several ordnance plants, including the Curtiss airplane plant at Buffalo, which, in light of today's airplane business, is rather a joke, but nevertheless—and the Dodge plant at Detroit, which manufactured recoil mechanisms for French 75 type guns.

The CHAIRMAN. Have you ever done any work before this engagement for the Atomic Energy Commission?

Mr. MACKENZIE. No, sir.

The CHAIRMAN. This was your first venture?

Mr. MACKENZIE. That is right.

Senator MURRAY. Well, Mr. MacKenzie, your explanation here of the activities of your firm applies to construction work, principally. Your problem in this instance was not one of construction, was it?

Mr. MACKENZIE. No. But I think I did qualify by stating that we had had a great deal of experience in locating sites for these projects, not only in this country, but outside the country. During the war, we had quite a hand in the selection and determining of the sites for these seven ammunition plants. So that the question of selecting a site was no new problem.

Senator MURRAY. When you were employed to do this job, did the Atomic Energy Commission give you a program, or lay out for you the problems involved in determining a site for this plant?

Mr. MACKENZIE. Yes; I would say they did.

Senator MURRAY. You would say they did?

Mr. MACKENZIE. Yes.

Senator MURRAY. Did they do that in writing, or verbally?

Mr. MACKENZIE. Both.

Senator MURRAY. What were their requirements?

Mr. MACKENZIE. Of course, it was only in the last few weeks that we began to find out in detail the shape of the buildings, and that sort of thing.

The CHAIRMAN. What are you finding that out for now?

Mr. MACKENZIE. We are working for the Atomic Energy Commission on an estimate.

Senator MURRAY. That has no relation to this problem at all?

Mr. MACKENZIE. No.

The CHAIRMAN. Are you engaged in that estimate along with anybody else?

Mr. MACKENZIE. No. We are doing it for the Argonne Laboratory in Chicago.

The CHAIRMAN. Your relations have been with them rather than with the main office here in Washington?

Mr. MACKENZIE. That is right.

The CHAIRMAN. Were you selected by the Argonne Laboratories?

Mr. MACKENZIE. Not on this survey. This is on the estimate that you are talking about, I believe.

The CHAIRMAN. Yes.

Mr. MACKENZIE. Our relations have been with the Argonne Laboratory.

The CHAIRMAN. Not on the site selection?

Mr. MACKENZIE. No.

The CHAIRMAN. But on the estimate on the reactors to be built there?

Mr. MACKENZIE. On the materials-testing reactors, yes.

The CHAIRMAN. Are you in competition with anyone else in this work?

Mr. MACKENZIE. No.

The CHAIRMAN. Does that explain the fact that you received the total sum you did? What was it you received for the site location?

Mr. MACKENZIE. You mean as a fee, or for the total work?

The CHAIRMAN. The total work.

Mr. MACKENZIE. It was something over \$30,000, I think.

No, it was a little higher than that; about \$45,000.

The CHAIRMAN. Your fee was very small, as I recollect it.

Mr. MACKENZIE. It was based on 10 percent of what we thought might be the cost, which was \$30,000. And it ran higher than that, somewhat.

The CHAIRMAN. It looks as though you got your foot in the door.

Mr. MACKENZIE. I hope we have.

The CHAIRMAN. Well, that was the purpose of setting that fee?

Mr. MACKENZIE. No; I wouldn't say that exactly, but it was the first opportunity that we had had to do some work for the Commission, and we certainly didn't want to—

The CHAIRMAN. I do not blame you for that. What I am interested in is, How did that come about.

Mr. MACKENZIE. How did we get this offer? By continually contacting the Commission and sending our credentials to them, and so on. Why they selected us eventually, I don't know.

The CHAIRMAN. You seem to have very excellent qualifications. I was not implying that there was anything irregular, and certainly nothing dishonest, but I was interested in tracing out the details as to your being awarded this job, out of which seems to be growing the engineering assignment for the whole project.

Mr. MACKENZIE. I can't say that. I wouldn't want to say that.

The CHAIRMAN. You would limit it to one reactor?

Mr. MACKENZIE. Not even that. All we have been asked to do is to make an estimate. We have not been awarded the contract for architect-engineer services on the project at all. Neither have we had any discussion with anyone tending toward negotiating for a contract or anything of that kind.

Senator ECTON. Mr. Chairman, I think your question of Mr. MacKenzie is very pertinent, and I am very much interested in it. I think it should be pursued a little further.

What I would like to know, Mr. MacKenzie is, How did you happen to get this job to make this survey of these two prospective atomic sites? Did you bid on it? Or were you approached by a member of the Atomic Energy Commission, asking if you could do it? Or how did you happen to land the job?

Mr. MACKENZIE. By continually making a nuisance of ourselves, I suppose, with the Commission and asking for work.

Senator ECTON. You went after it?

Mr. MACKENZIE. Not that particular job; no. We didn't know that there was such a job, but we knew that there probably was additional work to be done by the Commission, and we wanted some of it.

Senator ECTON. When you were engaged to do this work what were you supposed to do?

Mr. MACKENZIE. What were we supposed to do?

Senator ECTON. Yes; what were your instructions?

Mr. MACKENZIE. We were given the two sites, and we were supposed to survey these two sites and make a recommendation to the Commission as to which site they should purchase for this particular plant.

Senator MURRAY. Mr. MacKenzie, I started to ask you questions along that line a few moments ago, and you told me they gave you specifications as to what your requirements would be with reference to the location of such a site as this.

Mr. MACKENZIE. I believe that is so.

Senator MURRAY. What specifications did they give you? What did they tell you that was requisite for the location of a site of this character?

Mr. MACKENZIE. Here is a transcript of the project requirements.

Senator MURRAY. I know, but that was not what the Atomic Energy Commission gave you. That is a result of a survey that they made. And after that survey was made, they requested you to make a subsequent check-up on the matter to determine it. They had finally gotten down to the point where there were two places where this could be located. One was in Idaho, where they had two possible sites, and the other was in Montana. My understanding is that your firm was hired after this lengthy study had been made by the Atomic Energy Commission, and your task was to determine for them which of these sites would be the proper site for the location of the project.

Mr. MACKENZIE. That is correct.

Senator MURRAY. Well, now, what did they tell you when they told you to go and investigate this? You knew at the time that Fort Peck was considered a favorable site for the project. You knew that; did you not?

Mr. MACKENZIE. I think so; yes.

Senator MURRAY. What is that?

Mr. MACKENZIE. I believe so; yes.

Senator MURRAY. You knew that the prospects were that Fort Peck would be selected as the site?

Mr. MACKENZIE. I don't know that I ever knew that; that it was to that point. I knew it had been considered as a favorable site, as a possible site.

Senator MURRAY. The testimony here showed, it seems to me, that the Fort Peck site was the site that was regarded with most favor.

Mr. MACKENZIE. That was the testimony here in the investigation.

Senator MURRAY. And in the record, as I understand it, also. But you went out to undertake to establish the fact that the Idaho site was a better site.

Mr. MACKENZIE. I don't think that is correct. I don't think we went out with any preconceived idea at all. In fact, our problem was one of looking at two sites, and without any weight on either one, and determining purely from an engineering-survey basis which site we thought would fill the bill best.

Senator MURRAY. Then, in order to carry out that task, that undertaking, it would be necessary for you or your qualified engineers to go actually upon the ground and make a thorough investigation of the conditions that prevailed at both sites.

Mr. MACKENZIE. That is right.

Senator MURRAY. Did you actually go upon the ground, in the Montana site, at Fort Peck, and make a thorough investigation of all the conditions that existed there?

Mr. MACKENZIE. We had a number of men in the Fort Peck area for some time gathering information from all the available sources.

Senator MURRAY. Before you were engaged?

Mr. MACKENZIE. No: after we were engaged. We sent groups to both the Fort Peck and the Idaho sites.

Senator MURRAY. You sent experts to both sites?

Mr. MACKENZIE. Yes.

Senator MURRAY. What experts did you send to the Montana site? Give us their names, and just when they visited the Montana site, and what they did in the course of their investigation.

Mr. MACKENZIE. I don't know if I have that information here. There were quite a number of men involved.

Mr. GRUBB (principal engineer, Smith, Hinchman & Grylls). I don't believe I can give the dates.

Senator MURRAY. Well, can you give us the names of the engineers, qualified engineers, that you say actually visited the Montana site and went upon the ground and made a thorough survey?

Mr. GRUBB. I think I can.

Mr. MACKENZIE. I don't know whether I understand your question just exactly. The conditions at the time we made this investigation did not permit of our walking into the entire site and being able to see what was there, and what the ground looked like, because both sites were covered with snow at the particular time. So we had to go on the testimony of people who were familiar with those sites.

Senator MURRAY. So your report, then, was made up largely of testimony that you received from other parties who went on the site?

Mr. MACKENZIE. That is right.

Senator MURRAY. That would be, of course, hearsay testimony.

Now, who is the witness here, Mr. Chairman? It seems to me that this witness is undertaking to tell us that he had a contract with the Atomic Energy Commission and that that contract required him to make a thorough investigation of these sites that were contemplated by the Atomic Energy Commission. It seems to me that he ought to be able to tell us exactly what he did, what the names of the engineers are, and exactly what they did in the course of their investigation.

The CHAIRMAN. Senator, I agree with you that the testimony should be forthcoming. But, after all, it is a pretty big organization. Here is the president of it, and with him he has an assistant, maybe not his right bower but his left bower, who is supposed to know. And I think he is entitled to get the specific information from his assistants. Do you not think so?

Senator MURRAY. Well, he ought to be able to tell us who the engineers were that were directed by him to go upon the ground, when they went there, and what their report was.

The CHAIRMAN. I do not know whether he feels that he is competent to do that or not.

Mr. MACKENZIE. We can give you the names, but we don't have the information here as to the exact days when each man went to a certain place. We could get that together for the record, but we do not have it here.

Senator MURRAY. I think that is very important. Because the people from Glasgow have furnished affidavits to this committee indicating that these people that represented your firm, that came there for the purpose of making a study of the site, did not actually go upon the site at all. And, as you pointed out a moment ago, the ground was covered with snow. It was at a time of the year when it was impossible for you to make a proper investigation of your own. And you say that you took statements from other parties, and relied upon information which you received from others, with reference to the conditions that prevailed on the ground.

Mr. MACKENZIE. Including consultants whom we employed to give us information as to the geology and the water conditions, and so on, who know that country, and know it very well.

Senator MURRAY. They were not employed by your firm?

Mr. MACKENZIE. Yes; they were employed by our firm.

Senator MURRAY. Give us the names of those.

Mr. MACKENZIE. One is a geologist, Mr. Harold T. Stearns.

Senator MURRAY. Where does he reside?

Mr. MACKENZIE. Hope, Idaho, at that time.

Senator MURRAY. He resided at Hope, Idaho?

Mr. MACKENZIE. Yes.

Senator MURRAY. And you say that he was on the ground, at the Fort Peck project? This engineer?

Mr. MACKENZIE. Yes.

Senator MURRAY. He actually visited this ground at Fort Peck?

Mr. GRUBB. That is right.

Senator MURRAY. And made a thorough investigation of the conditions that prevailed right there on the actual site?

Mr. MACKENZIE. As to what could be done under the conditions.

Senator MURRAY. What was his name, you say?

Mr. MACKENZIE. Harold T. Stearns.

Senator MURRAY. And what did he report, then? Did he make a written report on the conditions that prevailed at the Fort Peck site?

Mr. MACKENZIE. Yes.

Senator MURRAY. And you have that report?

Mr. GRUBB. Yes, sir.

Senator MURRAY. I wish you would present it, sir.

Mr. GRUBB. It is a part of the survey.

Senator MURRAY. Is this your survey?

Mr. GRUBB. Yes; it is.

Senator MURRAY. This whole record, here, is a record compiled by your firm?

Mr. GRUBB. Correct.

Senator MURRAY. For the Atomic Energy Commission? And the report from that engineer from Idaho is included there?

Mr. GRUBB. It is included in the appendix to the survey.

Senator MURRAY. Did he report to you the weather conditions that prevailed in Montana at that time, and did he tell you that it was impossible to get on the ground, and that it was therefore impossible for him to make a study of the conditions?

Mr. MACKENZIE. I don't believe so. I mean, he is a geologist, familiar with the formations, and so on, in that locality; and he reported from his knowledge rather than from any survey of the site at that particular time.

Senator MURRAY. Well, how do you know that he was familiar with the geology in that particular location?

Mr. MACKENZIE. By his reputation as a geologist.

Senator MURRAY. You just assumed that. You assumed, he being a geologist and an engineer, that he knew the conditions there, without having to visit the ground and make a thorough investigation on the ground?

Mr. MACKENZIE. As far as the geology of that location is concerned; yes.

Senator MURRAY. And you were willing to accept his statement on that.

I notice Mr. Stearns' report here in the record that you have referred to, and he points out there that he had no personal experience with reference to the climatic conditions there. That is on page 4 of his statement. He also says in connection with thunderstorms that he had no personal experience. And I see nowhere in this statement does he claim that he had a thorough knowledge or understanding of the geological conditions that prevailed at this site.

The CHAIRMAN. Of course, Senator, it might be observed that any site which you could not approach in the middle of winter because of weather conditions might have something said against it.

Senator MURRAY. Yes; but I would like to have him say it. I would like to have him discover it and say it. Because it seems from our understanding of the case that the Atomic Energy Commission had practically agreed on the Montana site, and it was not until just a short time before Christmas that they began to change their views.

And they hired your firm at that time, Mr. MacKenzie. And apparently the task that you were given was to justify their action in turning down the Fort Peck project and reporting favorably on the Idaho site.

Mr. MACKENZIE. Well, I don't think the proposition was put up to us that way. In fact, I am quite sure it wasn't. We were asked to make a comparative report on two sites. At the time we started the report, I don't believe we had any knowledge at all that there was any question of giving it up, or whether they had made up their minds in any way with regard to the site.

Senator ECTON. In other words, you were to make the survey, and draw the conclusion as to which was the best site?

Mr. MACKENZIE. Right; independent of anything that we might have heard or might not have heard.

Senator ECTON. You were asked to get the facts, and come to a conclusion. Was that it, Mr. MacKenzie?

Mr. MACKENZIE. That is right.

Senator ECTON. In other words, it was your firm that decided that the atomic plant would be at Arco, rather than the Atomic Energy Commission down here.

Mr. MACKENZIE. I don't know that we decided that, quite. I think we would leave that up to the Commission, or the congressional committee, or someone.

But anyway, what we did was to examine these sites under about 14 different categories, or headings of qualifications, and put down the results of our investigation, and give so many points for each site on those particular qualifications, and add up the score.

Senator ECTON. Did you ask anybody, or did you contact any State authority or anybody within Montana who knew something about these various phases which you were investigating?

Mr. MACKENZIE. Oh, yes; many people within the State of Montana.

Senator ECTON. For instance, did you contact the State School of Mines at Butte?

Mr. GRUBB. I don't remember whether that was contacted or not.

Senator ECTON. And did you contact any of the engineers at Fort Peck?

Mr. GRUBB. Yes.

Senator ECTON. We have information to the effect that representatives of your firm did not contact some of the experienced engineers at Fort Peck in regard to this.

Mr. GRUBB. I think your information is in error.

Mr. MACKENZIE. I won't say that. You say you have information that we didn't contact some of the engineers. That may be quite possible. But we did, also, and there is no question about it, contact a number of engineers.

Senator MURRAY. Engineers at the Fort Peck site?

Mr. MACKENZIE. That is right.

Senator MURRAY. Will you give us the names of the engineers that you contacted there and the information that you got from them?

Mr. GRUBB. The only one I can recall right now is Colonel Lee.

Senator MURRAY. Colonel Lee?

Mr. GRUBB. He was the commanding officer, as I recall it.

Senator MURRAY. And you wish this committee to understand that Colonel Lee recommended against the Fort Peck site?

Mr. GRUBB. I do not. We asked him a specific question, which he proceeded to answer to the best of his ability.

Senator MURRAY. What was his answer?

Mr. GRUBB. The question related to the suitability of the Bearpaw shale for heavy foundations. There had been reports that the shale was incompetent, and the experience with some of the construction at the dam was not too good.

Movement had occurred in portions of the spillway, vertical movement of over a foot, presumably caused by swelling of the bentonite contained in the shale.

Senator MURRAY. Did you point out to this engineer the exact site that was about to be selected? I am not talking now about the dam and the conditions prevailing around the dam. I am talking about the location of the site, which was some distance away from the dam. Did you point out to him that location and ask him any questions with reference to the geological conditions there?

Mr. GRUBB. I think the question is misleading to some extent. I would say we didn't know the exact site, and perhaps we still don't know where the individual units are going to be located. We were concerned with the general area, comprising something over 400,000 acres, which is defined in the report.

Senator MURRAY. And in your survey, then, you did not know the exact location of the site that was to be provided for this project.

Mr. MACKENZIE. You cannot make a site plan and locate structures, and so on, relatively, until you have a complete survey of the site, of the particular site, and know the boundaries. And we did not.

Senator MURRAY. You did not have that?

Mr. MACKENZIE. We didn't have that survey at that time, no; on either side.

Senator MURRAY. These conditions that you have referred to in reference to bentonite do not exist at the actual point where this site was to be located?

Mr. GRUBB. We have no information that that was the case. All the information we had was as to the shale over the entire area, or underlying the entire area.

Senator ECTON. Why did you not contact the Geological Survey offices in Helena and Great Falls? They had made a study of those formations out there for years.

Mr. MACKENZIE. We did that; did we not?

Mr. GRUBB. I don't think we did. I think this might clear up the problem. We were concerned principally with the ability of this material to stand up under heavy loads. As a result of our investigation and examination of information, we concluded that it is competent; and we have not penalized the Fort Peck site in any way beyond what had been found necessary to be done in the construction of the dam; namely, to seal the exposed surface of the shale to prevent loss or pick-up of moisture, which results later in a swelling of the material.

There appears to be another minor problem. The shale is somewhat elastic, and the movement of some of the slabs in the dam spillway appears to result from a rebound of the shale following the removal of a large amount of overburden.

Senator ECTON. But it was not penalized on this account? Is that right? Did I understand you correctly?

Mr. GRUBB. That is right. The only penalty we attached to the Fort Peck site, insofar as geology was concerned, was the need for sealing freshly exposed surfaces of shale to prevent this moisture change which results in swelling of the material and consequent movement of whatever is imposed on it.

Representative MANSFIELD. Will the gentleman yield?

According to the Montana Standard for April 24, the Great Falls Tribune of May 1, and the Glasgow Courier, it is stated:

The Montana area was rejected as the site for the atomic reactor station partly because a report declared there was danger from earthquakes and floods. This statement, I understand, is in the statement of Smith, Hinchman & Grylls, the industrial engineers who surveyed the various sites.

On what do you base a statement such as that, which is absolutely fallacious and without foundation.

Mr. GRUBB. Would you read the basis on which it was supposed to be rejected?

Representative MANSFIELD (reading):

The Montana area was rejected as the site for the atomic reactor station partly because a report declared there was danger from earthquakes and floods.

So far as I know, we have never had an earthquake up in that region; though we have had them, and still have them in the region of Helena, which is a good deal closer to Arco. They have had earthquakes in the Pacific Northwest within the past month. But, to my knowledge—and I am sure the delegation can bear me out—there has never been an earthquake in that part of Montana. And, so far as the floods are

concerned, we have minor rises in the water at certain times, during certain years, but nothing of any consequence.

Mr. GRUBB. In regard to earthquakes, we examined the earthquake data for the area, such as it is. It, of course, is not too old. As I recall, it dates back to something like 1880 or 1889. Since that time, it is likely that Glasgow, Mont., was disturbed most by an earthquake which occurred in Saskatchewan in 1909. That appears to be the only quake which probably disturbed Glasgow to any appreciable extent.

Representative MANSFIELD. Senator Murray, you are a few years older than I am. You were in Montana at that time. Do you recall any earthquake in the vicinity of Glasgow or Fort Peck in 1909?

Senator MURRAY. No. I was there then, and I never heard of an earthquake in that area.

Mr. GRUBB. It perhaps didn't exceed an intensity of four or five, which might have been overlooked. In any case, Professor Williams from Logan, Utah, who was retained as a consultant on earthquake hazard, concluded that the Fort Peck area was substantially as safe as any area in the United States. And there was no penalty attached.

Representative MANSFIELD. Why did you go to Utah to get somebody to give you a report on the earthquake factors in Montana, when at the school of mines you have a seismograph and a faculty which is well versed in this particular matter?

Mr. GRUBB. Certainly, a disinterested third party is of more value for our purposes than a partisan.

Representative MANSFIELD. I see.

Senator MURRAY. You think this school of mines would be a partisan institution and would not give you the truth?

Mr. GRUBB. I didn't mean to say that. I said that it would be of more value, and I think that is true.

Senator MURRAY. It would be of more value to take your information from some outside source?

Mr. GRUBB. From a competent third party, by all means.

Senator MURRAY. And, in this instance, who was the competent third party?

Mr. GRUBB. Prof. J. Stewart Williams.

Senator MURRAY. Who?

Mr. GRUBB. Prof. J. Stewart Williams from Utah State Agricultural College at Logan, Utah.

Senator MURRAY. And he advised you, did he, that the Montana location was a dangerous location on the account of the possibility of earthquakes?

Mr. GRUBB. He did not.

Senator MURRAY. What did he tell you?

Mr. GRUBB. He said that the Fort Peck area was as safe as any place in the United States. That is stated in the report.

Senator MURRAY. We are in full accord here. Then, where do you get the information that it was dangerous from that standpoint? Did you have any information of that kind whatever?

Mr. GRUBB. It appears that that is a newspaper fabrication.

Senator MURRAY. You were talking a little while ago about Colonel Lee. Colonel Lee tells us that the tallest and heaviest building in Montana is the powerhouse at Fort Peck.

Mr. GRUBB. I think probably the surge towers at the dam are the heaviest.

Senator MURRAY. The towers?

Mr. GRUBB. The surge towers at the dam, in connection with the powerhouse; yes.

Senator MURRAY. And he told you that no fault or movement has ever occurred at that place?

Mr. GRUBB. That is correct.

Senator MURRAY. So that, from the standpoint of any movement or any danger from conditions of that kind, they do not prevail at all.

Mr. GRUBB. That is right. Except that that powerhouse was conducted with benefit of some earlier experience, wherein it was found that sealing of the shale was necessary.

Senator MURRAY. But, so far as this site was concerned, which is some considerable distance away from that dam, you never got any exact information on that.

Mr. GRUBB. We have no borings.

Senator MURRAY. So that there is nothing to indicate that there would be any danger from erecting buildings on that ground.

Mr. GRUBB. I think that is correct; yes. That is right. We gave this place no penalty on the Fort Peck site because of any supposed incompetency of the soil. We had to go to the bedrock.

Senator ECTON. What did bring forth the penalty for Fort Peck site?

Mr. GRUBB. In respect to geology?

Senator ECTON. Yes.

Mr. GRUBB. Merely the problem of sealing the soil, sealing the exposed shale.

Senator MURRAY. Sealing the exposed shale. That was the only problem?

Mr. GRUBB. That appears to be the only problem.

Representative MANSFIELD. That was the only reason why Arco was selected over Fort Peck?

Mr. GRUBB. No, sir.

Mr. MACKENZIE. Oh, no.

Mr. GRUBB. That is the only reason that we expressed a preference for Idaho in respect to geology.

Representative MANSFIELD. What were some of the other penalties against Fort Peck that you enumerated in your report to the Atomic Energy Commission?

Mr. GRUBB. We considered 12 or 14 points. The first was isolation. The second was security. The third was climate.

Senator ECTON. Let us take them one at a time.

Mr. GRUBB. All right.

Senator ECTON. Your name is Grubb?

Mr. GRUBB. That is right.

Senator ECTON. Of course, you understand, Mr. Grubb, we are not isolationists out in Montana, but we understood that the Atomic Energy Commission wanted a site that was isolated. And we thought that we had 400,000 acres out there that could meet those requirements.

Mr. GRUBB. They do meet the requirements, and they meet them very well. On the other hand, that is just one point of a dozen or more.

Senator MURRAY. Was that a point that was objectionable?

Mr. GRUBB. That was a point that was in favor of Fort Peck.

Representative MANSFIELD. Oh, in favor of Fort Peck.

Senator MURRAY. We are trying to find out from you what are the points upon which you based your rejection, or your recommendation against Fort Peck.

Mr. GRUBB. All right. The second point which we considered, rather briefly, was security, and we expressed no very definite opinion for either one, mainly I think, because we were not competent as to the knowledge of the military problems involved, because that wasn't within the scope of our work.

Senator MURRAY. So you expressed no opinion on that. All right, sir. What was the next one?

Mr. GRUBB. There was a slight disadvantage to Fort Peck in that regard, however, in that it is close to the Canadian border, which introduces some minor problems which you can imagine as well as I.

Senator MURRAY. The fact that it was close to the Canadian border? We do not expect any attacks from Canada; do we? We do not expect the Canadians to come down and attack us?

Mr. GRUBB. I don't think so; no.

Senator MURRAY. They are extremely friendly to us out in Montana.

Mr. GRUBB. That is very fine.

Senator MURRAY. I thought that would be a point in our favor: To have it located close to a border on the other side of which there is a friendly power. It seems to me that you could not find any objection on that, on the fact that it is close to the Canadian border.

Representative MANSFIELD. Furthermore, you have one of the most vital airfields in the United States at Great Falls, and satellite air bases right in the vicinity of the Fort Peck Glasgow area, for protection.

Mr. GRUBB. Perhaps so, sir. As I say, we did not consider security as too important a point in our discussion.

Senator MURRAY. So that does not figure in your report.

Mr. GRUBB. No.

Representative PRICE. It does figure in the report. That was one of the points on which they gave a preference to Idaho.

Mr. GRUBB. The preference was based mainly on the proximity of the Canadian border.

Senator MURRAY. You preferred Idaho?

Mr. GRUBB. Because they were more centrally located.

Senator MURRAY. Because the Montana site was located near the Canadian border?

Mr. GRUBB. That is right.

Senator MURRAY. Well, what is the basis of that conclusion? It seems to me that there ought to be some basis for your conclusion that a site being closer to the Canadian border than the Idaho site would be less desirable. Otherwise it does not hold water.

Mr. GRUBB. Certainly the center is more secure than the circumference.

Senator MURRAY. You think notwithstanding the fact that we have this great Army air base at Great Falls, which has satellites all over the State of Montana, included in this particular area, this location is a danger spot? It is not as secure as the location down in Idaho?

Mr. GRUBB. I am afraid we are talking about very small degrees of difference. I would not like to magnify them any more than they are.

Senator MURRAY. You do not consider that an important point?

Mr. GRUBB. It is not too important, certainly not.

Senator MURRAY. All right.

Mr. GRUBB. The matter of climate was the next factor we considered.

Senator MURRAY. Give us the dope on the climate.

Mr. GRUBB. There are a number of significant figures.

Senator MURRAY. What are they, and where did you get them?

Mr. GRUBB. I do not think you will find them in Dr. Stearns' report. They are taken from the Weather Bureau records for both areas.

Senator ECTON. Havre, in Montana? Is that where you got them?

Mr. GRUBB. By all means, Havre. It might be of interest to know that the highest and lowest temperatures within the history of the weather stations generally around that area were recorded, both of them, at Glasgow, Mont., 35 miles or so from the site. The highest temperature recorded in the area is 113°, I believe, at Glasgow, and the lowest is minus 56° at Glasgow.

Representative MANSFIELD. You recognize the fact, though, that Havre is 200 miles west of Glasgow.

Mr. GRUBB. No; this was Glasgow, sir.

Representative MANSFIELD. But you say you got your figures from the Havre weather station? That is about 200 miles west of Glasgow.

Mr. GRUBB. About 170.

Representative MANSFIELD. Yes. Well, certainly that should not give you a very good indication of the weather, that far away.

Mr. GRUBB. That is true. As I say, our temperature figures are based on Glasgow.

Representative MANSFIELD. On readings in Glasgow?

Mr. GRUBB. That is correct.

Representative MANSFIELD. Did you take your readings in Glasgow and Havre only, or did you take your readings in other parts of the immediate vicinity?

Mr. GRUBB. We took all the stations that were available within a radius, perhaps, of 100 miles or more. Havre is somewhat farther away than that. Glasgow, Malta, Jordan—Jordan is the other side of the reservoir. Malta is up the road a way—and Telegraph Creek, Fort Peck, Havre, and Williston, N. Dak. Williston and Havre, I guess are the farthest away. They are about equally distant east and west of Glasgow.

Principally, our weather analysis is based on Glasgow, and the information that we were able to obtain about that area. The degree day value for that part of the country in Montana is about 85 hundred-degree days, where as for the Pocatello site, it is about 68 hundred. That is quite a significant difference, and is a measure of the intensity or the severity, and the coldness, of the climate.

Senator MURRAY. Do you know that in the construction of the dam there, the contractors worked the year around?

Mr. GRUBB. I wouldn't be surprised. It is quite possible. We work all year around in many places.

Senator MURRAY. I lived in Montana for more than 50 years, and I am also very familiar with Idaho.

Mr. GRUBB. Yes, sir.

Senator MURRAY. I have spent a great deal of my time around Pocatello, Idaho, many, many years ago. And I can see no observable

difference in the climates of both places. They are both cold in the winter.

Mr. GRUBB. True.

Senator MURRAY. And on the whole, they are very satisfactory climates, I think.

These people back here will laugh at that, but I just attended hearings yesterday in which the medical profession were recommending that people go to climates like Montana.

Mr. GRUBB. And Idaho.

Senator MURRAY. It was recommended that they go there to escape from some diseases like arthritis and rheumatism and things like that.

People like the pure air of Montana, which is so conducive to good health that we were able to send more boys to the war in the last war than any other State of the Union in proportion to our population. Did you know that?

Representative MANSFIELD. The last two wars.

Senator MURRAY. That is a fact that cannot be denied.

Selective Service has the proof on that. And it seems to me that you easterners take a great deal on hearsay about these things. You read in the papers about this cold weather out there, but there is a lot of baloney to it, it seems to me. We seem to thrive on it out there, and I know very well that the engineers and the men that worked at that plant out there, worked all year around.

Mr. GRUBB. That is not unusual at any place in the States.

Nevertheless, our analysis is based on the Weather Bureau data.

Senator MURRAY. I see.

Mr. GRUBB. We have already discussed geology, I think.

Senator MURRAY. Then the Weather Bureau data are all that you have that undertakes to show favorable conditions for Idaho over Montana.

Mr. GRUBB. Yes, as far as weather is concerned.

Senator MURRAY. Then what other points have you discovered against the Montana site?

Mr. GRUBB. The next point we considered was drainage.

Senator MURRAY. What is that?

Mr. GRUBB. Drainage.

Senator MURRAY. All right. Give us information on drainage. What are your relative reports on that?

Mr. GRUBB. The soil at Fort Peck—let's say first that we were concerned with problems of drainage only as they might arise in the event of a catastrophe; that is, to have one of these piles burn up.

Senator HICKENLOOPER. I wonder if you would let me interrupt you for just a second?

I did not get here quite in time to hear the witness discuss several of these points. I take it you are going down the line of the qualifications set forth on this sheet.

Senator MURRAY. Yes.

Senator HICKENLOOPER. I did not get to hear him discuss the matter of security. I wonder if you would mind if he repeated in just a few words, why security was classified as "good" at Fort Peck, and "very good" at Pocatello?

Mr. GRUBB. We expressed a slight preference for the southern site because it was more centrally located.

Senator MURRAY. He objected to the site in Montana as being too close to the Canadian border. Apparently he was afraid that our Canadian neighbors might make a sneak attack on us like the Japs made at Pearl Harbor.

Mr. GRUBB. I don't think that was the concern so much as it was that in a site more centrally located the United States would be able to cope on its own with the problem, whereas in the other place there would be a combined problem in which more than one country is concerned.

As I said before, we were not too strongly concerned, too greatly concerned, with security, because we did not have the information which was necessary for a complete evaluation of that phase of the problem. We were asked to express an opinion on the basis of such information as we had, or could develop; and we did. Our opinion was that the Fort Peck site is at a slight disadvantage on account of its proximity to the Canadian border.

Senator HICKENLOOPER. Who in your company has had experience in security matters?

Mr. GRUBB. Regional security, such as this? Nobody. We have had local security problems, such as fencing. We have faced those frequently.

Senator HICKENLOOPER. The reason for the question is: Did you have anybody who was adequately equipped to pass on the question of comparative security between this place and the other place? Security is a pretty technical subject.

Mr. GRUBB. That is true.

Senator HICKENLOOPER. And I take it you do not have anybody in your company that is especially trained in security matters, and qualified.

Mr. GRUBB. That is right. We were asked, however, to express an opinion insofar as we were able to develop it.

Representative PRICE. You just had no one in the organization capable of expressing such an opinion.

Mr. GRUBB. We had one, so far as we were able to develop it. We don't present this as an expert opinion.

Senator HICKENLOOPER. If that is the case, then, I would think in all fairness the question of security ought to be marked out. There would not be any justifiable comparison there one way or the other.

Senator MURRAY. It seems to me the same thing would apply with reference to weather. As I say, in the construction of the Fort Peck Dam, they worked all year around. Many people who have lived in Montana for 50 years have found that weather out there very satisfactory and beneficial, and have found it to be a healthy climate.

Senator HICKENLOOPER. With equal fairness, Senator, I would have to take the position that if they had a long historic weather record at both places, they probably would be in a much better position to give an opinion or evaluation on what would be desirable weather conditions. I merely mention the security business because it is apparent that they did not have anybody in the company who knew anything about security, so I do not think they should have classified it from the standpoint of security. That is just my personal opinion.

Excuse me. I did not mean to interrupt.

Mr. GRUBB. I think that it might be worth while to read the opening paragraph in our section on security.

I quote:

It is not within the scope of this survey to analyze the possibility of attack or the manners in which such attack might be made. The problems of security, and the ability of the armed forces to protect from the land or air attack whatever site is chosen, presented an important factor in the selection of this site. Therefore, it is recommended that the Atomic Energy Commission obtain such an analysis from competent authority which is available to the Commission.

Senator HICKENLOOPER. Well, right there in the first paragraph, you bar yourself from passing any judgment on security at all.

Representative PRICE. I did not mean to cast any reflection on your organization. I meant that you just have not been in this business of passing on security measures.

The CHAIRMAN. You see, the unfortunate part about it is this, as I see it: In the nature of the disqualification, when you admit that you have no competence in the field, then to give it a rating of "good" in one instance, and "very good" in another, casts something of a shadow on your findings on manpower and other things. It is a form of a "by guess and by golly" formula.

Mr. GRUBB. You will recall, sir, that this report was not to decide where the site was going to be, where this plant was going to be. This report was given to the Atomic Energy Commission. And while we were asked to make a selection, it was intended basically to present factual data to enable them, and assist them, in finalizing their ideas on where this was to go.

Senator HICKENLOOPER. Yes, but who set down this classification, here, and gave the ratings? Did the Commission do that, or did you?

Mr. GRUBB. What page are you speaking about?

Senator HICKENLOOPER. I am talking about this page here.

Mr. GRUBB. We did that.

The CHAIRMAN. You see, the Commissioner, when he voted on the site, had this in front of him. And these five men do not have the time to read great thick reports. I presume they leave that to the staff. If they had it handed to them, with your finding on security "good," and "very good," they would think it would be made on an intelligent estimate rather than simply a guess.

Mr. GRUBB. Perhaps so. We felt that that was our opinion, and that it is presented as an inexperienced opinion, perhaps, within the report.

Mr. MACKENZIE. I think it is just our opinion, and that is all; acknowledging that we are not qualified as experts on defense.

Senator MURRAY. Mr. Chairman, my understanding is that the Commission had practically decided that the Fort Peck site was the appropriate site for this project. But it seems that at the last moment they began to think about the recreational and climatic conditions in connection with this, and then they hired this firm.

Senator HICKENLOOPER. Do not forget the night life you mentioned the other day, Senator?

Senator MURRAY. Yes; that is right; the recreational features and wildlife. It is not, of course, the same kind of "wildlife" that you have reference to, Senator.

But my understanding is that this report that you made switched the Commission from Fort Peck to Idaho; and that switch was based upon the conclusions you had given them in your report.

Mr. GRUBB. I do not know that that is the case. So far as I know, no decision had been made by the Commission at the time this project was undertaken.

Senator MURRAY. But they had found all the conditions in Montana satisfactory up until the last moment, when they began to think about the recreational and climatic and social conditions. They talked about how these people that would be brought there would have some esthetic notions about life and wanted to live in more pleasant and agreeable surroundings. And your report seems to have compelled them to conclude that Idaho would be a more favorable location?

Mr. GRUBB. Perhaps it did. But certainly we feel that way.

Senator MURRAY. You think that the Idaho location is a more favorable one. What, then, are the conditions in Idaho that you think are more favorable than those in Montana?

Mr. GRUBB. Climate, geology—

Senator MURRAY. You think the climate in Idaho is so much more favorable than that of Montana?

Mr. GRUBB. I think it is more favorable. I would not presume to measure the difference. Perhaps the best data is the degree-day data. In the case of the one it is eighty-five hundred, and in the case of the other sixty-eight hundred.

Senator MURRAY. And how about the recreational conditions? Is there not just as good opportunity for recreational activities in Montana as there would be down in the other place?

Mr. GRUBB. What sort of recreational facilities do you have in mind?

Senator MURRAY. Well, we have the finest fishing in the world, and we have the finest hunting in the world, and we have a beautiful lake there which is becoming developed for recreational purposes that will, I think, measure up with anything they have around Idaho. We have two national parks located in Montana, and we have dude ranches scattered all over the State which attract people from every part of the world.

Mr. GRUBB. The Idaho area, within an equal radius, with that which you are encompassing, has these parks and one thing and another, and also has numerous natural places of beauty, parks and the like, the Craters of the Moon National Park being not very far away. Sun Valley is nearby.

Senator MURRAY. Nearby?

Mr. GRUBB. Some 80 miles or so?

Senator MURRAY. I think it is much farther than that.

Mr. GRUBB. But we aren't concerned so much with places where somebody can go once or twice a year on a picnic or a hunting expedition, or to go fishing. We are concerned with recreational facilities that a man can take his family to of an evening.

Senator MURRAY. That is exactly what I have reference to. This lake is located within a walk from the site of this plant.

Mr. GRUBB. It is a pretty long walk.

Senator MURRAY. Oh, I do not think so. Just a couple of miles.

Mr. GRUBB. You are speaking of the reservoir?

Senator MURRAY. Yes; I am speaking of the reservoir, one of the biggest inland lakes in the United States.

Mr. GRUBB. Perhaps so. That is still quite a long walk. Where are the people to live?

Senator MURRAY. Well, the people there offer to furnish the housing.

Mr. GRUBB. Build on the shore of the lake?

Senator MURRAY. Build where it would be desirable for these people to live. They offer to provide that, and offer to give a guaranty that they will supply the housing needs of these people on a rental basis from a private source. And you are proposing to have the Government enter the building business and build homes down there for these people, when we can furnish them, by private enterprise, right here on the site of the Fort Peck project.

Mr. GRUBB. In regard to the offer of erecting housing, certainly it is a very generous and attractive offer. Probably also the people of Idaho will be willing to make an equally generous offer.

Senator HICKENLOOPER. Did I not see in the Sunday supplement of last Sunday's newspaper where people are getting ready to get rich out of the promotion there in Idaho?

Senator MURRAY. Prices have jumped up there by the thousands of dollars.

Senator HICKENLOOPER. Land is skyrocketing, and people are selling filling station sites and making big profits there in Idaho.

Representative PRICE. One fellow has already tripled the size of his tavern.

Representative MANSFIELD. That is a very unhealthy situation, which could be corrected by selecting Fort Peck as the site.

Mr. GRUBB. Let me say that this matter of housing certainly couldn't have been evaluated at the time this selection was made, because we had no knowledge of it. Furthermore it even now can't be evaluated, because there are a great many questions that necessarily exist as to how it is to be accomplished, and where it is to go, and many other questions.

Senator MURRAY. You think a more thorough study of the situation now might develop a lot of things that were not thought of at the time the previous studies were made?

Mr. GRUBB. No, sir; I don't propose that. I am not saying that.

Senator MURRAY. You are not saying that?

Mr. GRUBB. I am saying that the offer of building houses can't be evaluated on the basis on which it is now made.

Representative PRICE. In your social factors, have you included the matter of housing?

Mr. GRUBB. Yes, sir.

Representative PRICE. What else was considered in your social factors?

Mr. GRUBB. Housing, recreation, the number of people there now, and the ability of the existing communities to serve the people and absorb them.

Representative PRICE. What factors did you find at the time of your survey in connection with housing at the two sites?

Mr. GRUBB. I think at Glasgow, it was concluded that substantially all of the homes needed for personnel, permanent personnel, would have to be provided by somebody. At Pocatello, it was assumed that probably 25 percent of the people, of the families moving in, would be absorbed by existing communities, and the other 75 would have to be provided for.

Senator MURRAY. Pocatello is 75 miles away from this Idaho site.

Senator ECTON. How could they live at Pocatello and work at this site, some 80 miles away?

Mr. GRUBB. It could be done by providing transportation.

Senator MURRAY. That would be 160 miles a day, then, going and coming.

Mr. GRUBB. Well, Pocatello isn't the only place that could absorb people. Blackfoot and Idaho Falls are both much closer than Pocatello is. Blackfoot is 47 miles, or so, just under 50, and Idaho Falls is, I guess, a little over 50.

Representative PRICE. The nearest settlement of size is at least 47 miles away from the site?

Mr. GRUBB. Well, Arco is the county seat. There are about 600 people there, or thereabouts. And Blackfoot has some four or five thousand.

Fort Peck is not, I think, a suitable place to expand a large civilian population. It is a Government reservation.

Senator MURRAY. We had 20,000 people there during the construction of the dam.

Mr. GRUBB. Yes; but they were all associated with the dam, the construction of the dam.

Senator MURRAY. Yes. But we supplied housing for them. And it was a situation in which a good many of the workers lived right in Glasgow. Only a small portion of them lived at the site of the dam.

Mr. GRUBB. Well, first let's say there are two classes of people for whom homes have to be provided. One is the construction workers and the other is the permanent employees of the station.

We have assumed that in both places, a large construction camp will have to be built, and probably temporary housing of one sort or other will be brought direct.

Representative PRICE. Mr. Grubb, you estimate that at the Fort Peck site 100 percent housing requirements would have to be met by new construction.

Mr. GRUBB. Yes, sir.

Representative PRICE. And you say that at the Arco site about 25 percent can be absorbed by an existing housing facility.

Mr. GRUBB. Yes, sir.

Representative PRICE. All right. How much of that 25 percent would be as far away from the site as Pocatello?

Mr. GRUBB. I wouldn't presume to say; probably a very small portion of it.

Representative PRICE. You say they can absorb in that community right now 25 percent of the new people that would go in there, for permanent residence?

Mr. GRUBB. We estimate in the area around there some 25 percent could be handled. Now, that includes a half a dozen communities, all of which are as large as or larger than Glasgow.

Representative PRICE. But none of them within 50 miles of the site?

Mr. GRUBB. They are for the most part within 50 or 60 miles; yes, sir.

Senator ECTON. What are some of the other factors that you made the final decision upon, Mr. Grubb?

Senator HICKENLOOPER. I think it would be helpful if you would just take this list and go right down, in each category, stating why the rating was made.

Representative PRICE. I think you skipped over a few. We were on drainage, and then we got into social factors.

Mr. GRUBB. Drainage is the next one; the one that we stopped at.

Senator HICKENLOOPER. Is that all right, if they just go down the line that way?

Senator ECTON. That is what we want.

Mr. GRUBB. As I was saying, we were concerned, with respect to drainage, with a catastrophe, not with the handling of the normal discharge from this plant. That will be presumably retained; or, if there is contamination, there would be no problem involved, perhaps, at any place in the country.

In the event of a catastrophe, however, we could visualize the sudden liberation of a large amount of radioactive material. We visualized also that that would present a very serious hazard to the Missouri-Mississippi waterway, since the Fort Peck area, the dam, is well up along the waterway.

Now, at Pocatello, the occurrence of such a catastrophe would produce material which would drain off into the ground.

Senator ECTON. Do they not have underground rivers and streams in that Idaho territory?

Mr. GRUBB. That is right. The lava underneath is honeycombed, and porous and broken up, and carries a great deal of water.

Senator ECTON. Well, would that not be dangerous?

Mr. GRUBB. It would, to some extent. However, because of the time factor, through which the water is held in the ground, the effect would be minimized, since a lot of dilution could occur before it would appear many miles downstream from the occurrence of the catastrophe.

Senator HICKENLOOPER. Is not the land there in Idaho composed of a cracked-lava formation?

Mr. GRUBB. In some places lava is exposed, and in others it is covered with 5, 10, 20, or 30 feet, in places, of sand and clay.

Senator HICKENLOOPER. I just mean that this water goes right down through the lava until it hits bedrock formation, and then washes off into another stream.

Mr. GRUBB. It presumably would join the underground water table, which moves in a southwesterly direction at a very slow rate of speed. The discharge of radioactive material into it would be diluted many times in the period of the years before it would be discharged into any open stream.

Senator HICKENLOOPER. What technical advice did you have on that within your organization in order to be able to evaluate how rapidly or how slowly radioactive substances would be dissipated in the ground? Did you have anybody in your organization capable of making that kind of analysis?

Mr. GRUBB. I would say "no." However, that was not precisely the question here. In one case, we were concerned with a soil which did not absorb anything, but which was conducive to a very rapid run-off, because the surface of the soil at Fort Peck is pretty impervious. In this gumbo clay, the run-off would be pretty rapid. In the other case, we had a soil of a condition which permitted the water, or whatever

material it was, to go directly down and not spread out over a large area.

Senator HICKENLOOPER. But what I am trying to get at is what reliable evaluation of the qualities of radioactive material that might in some catastrophe be dumped on this ground was at your disposal. Did you have somebody in your organization capable of evaluating that, and saying that there was any more danger when surface water runs off into a stream than when surface water soaks down through the ground? Do you know whether the soaking through the ground will in fact filter out radioactive materials out of water?

Mr. GRUBB. We don't know. I don't know that anybody could answer that question specifically.

The CHAIRMAN. Wait a minute. Maybe it can be answered. [Reading:]

In the event of the falling apart of a reactor, fission products and primary fuels will be scattered some distance. At Arco this material will percolate into the lava beds—

I might say I am reading from a memorandum. I do not endorse it as to accuracy, except that it comes from someone who has some qualifications.

At Arco this material will percolate into the lava beds and reach the Snake River 75 years later, according to the Smith Hinchman & Grylls report.

Senator HICKENLOOPER. Seventy-five years?

The CHAIRMAN. Yes.

according to the Smith, Hinchman & Grylls report.

Continuing:

By this time most of the short-lived fission products will have been dissipated, it is true, but the tons of primary fuels, uranium, or plutonium (which are extremely dangerous in even small concentrations when taken internally) will not lose their radioactivity for thousands or million of years. Seventy-five years will have no effect on their potency. How has the Commission decided to control these contaminating products underground where they will be flowing down old channels of the Snake River? What if my previous testimony regarding a show of coliform contamination in the Thousand Springs area proves correct, and fission products only take a very short time to reach the Snake River?

At Fort Peck, the Smith Hinchman & Grylls report has stated that the soil is impervious. That is a distinct advantage to Montana's site. In the event of the falling apart of a reactor there, the fission products and the primary fuels would remain on top of this impervious surface. As the site is on top of a table of land with no water drainage into the area, a simple 2-foot retaining wall would prevent any possible leakage of whatever meager rainfall might occur and the flooding of the area with oil after the catastrophe would insure its protection from any winds. After a few month this area would be a valuable uranium mine which could be worth millions of dollars. The uranium or plutonium could be collected and reused to good advantage, and no danger of any kind would accrue to man or beast.

What do you say to that?

Mr. GRUBB. I think it is an oversimplification of the problem?

Senator MURRAY. You have already stated, though that you did not have anybody in your firm competent to make this analysis.

Senator HICKENLOOPER. That 75-year business is what surprises me. How far is it from the Snake River?

Senator MURRAY. It is a very short distance. I do not know the exact mileage. Does anybody here have that?

Mr. GRUBB. It is about 150 miles.

Senator MURRAY. It would not take 75 years to go that far, I should think.

Representative MANSFIELD. Following up the same question which you raised, and maybe quoting the same individual, according to the Montana Standard of May 1, 1949, Mr. R. L. Ewing, highway commission district engineer at Wolf Point, Mont., informed Mr. T. J. Hocking, Glasgow publisher, that—

all of southern Idaho could be endangered by radioactive waste waters—

I will give the remainder of this material to the reporter for insertion in the record.

(The material supplied is as follows:)

According to the Montana Standard, May 1, 1949, Mr. R. L. Ewing, highway commission district engineer at Wolf Point, informed Mr. T. J. Hocking, Glasgow publisher, that "all of southern Idaho could be endangered by radioactive waste waters which the Atomic Energy Commission claims would be dumped down cracks in lava beds at the Arco, Idaho, site of the AEC's atomic reactor plant."

Mr. Ewing contends that "radioactive waters could be controlled easily at the proposed Glasgow site by low reservoirs, where gumbo bottoms are impervious and water would not seep away."

I request the committee to check a statement carried in the Montana Standard, April 24, 1949; Great Falls Tribune of May 1, 1949, and the Glasgow Courier to the effect that "the Montana area was rejected as the site for the atomic reactor station partly because a report declared there was danger from earthquakes and floods."

This statement is in the report of Smith, Hinchman & Grylls, the industrial engineers, who surveyed the various sites for the Atomic Energy Commission. There is, of course, no foundation of fact in this statement by the industrial engineers but I am calling it to the attention of the committee and requesting, in behalf of the people of Montana, information as to why and how this conclusion was arrived at.

Senator HICKENLOOPER. Mr. Chairman, if I may suggest, we are getting into this question of contamination. I believe it ought to be emphasized that if there were any real anticipated danger of contaminations or blow-ups or anything of that kind, we would not be building these plants with nearly so much freedom. The fact is that the contamination in the ground that we are talking about is only the almost unforeseeably remote possibility that some accidental thing might happen. The probability is extremely remote, and I do not think we would urge reactor plants being built at either of these sites if it was going to contaminate the ground for miles around.

Senator MURRAY. It is a well-known maxim that the impossible sometimes happens.

Senator HICKENLOOPER. The only reason I said this is that I thought maybe we might be in our conversation creating a suggestion, Mr. Chairman, that there was great danger. The danger is in fact extremely remote. It is one to be considered, of course.

Senator MURRAY. I understood there were a lot of springs in this area, there, and they do not know where the spring water comes from.

Now, if these radioactive particles are going to get into those springs, what is going to happen down there? It seems to me that is a pretty serious problem. That is a well-known fact: that there are all kinds of springs in that neighborhood that are used by the people there.

Did you get any information about that?

Mr. GRUBB. That there were springs there?

Senator MURRAY. Yes.

Mr. GRUBB. Certainly. We know they are there.

Senator MURRAY. Then what about the danger of contamination of those springs as a result of these radioactive particles?

Mr. GRUBB. The best information we could obtain, I will say first, is that the rate of flow of the water through the ground is very slow. According to the best sources of information that we have, the average is perhaps a half mile a year. In the event of a catastrophe, such fissionable products might be expected to join the underground water table and flow through these natural outlets, the springs along the banks of the river, and at the same time considerable dilution would occur and the effect would be greatly minimized.

The CHAIRMAN. Senator, I think Senator Hickenlooper is entirely correct in insisting that the probabilities of any contamination due to catastrophe, to which, of course, we are directing our attention, are very remote. The big point to me is that drainage has been listed as one of the factors. It turns out that it is a very slight factor indeed.

Of course, we do not know what percentage, if any, was allocated by you to this factor, as a percentage of your decision; how you weighed it. But certainly as to your rating of "fair" or "good," it did not weigh very heavily in your decision and recommendation.

Mr. GRUBB. Perhaps not too strongly. I think it should be said again, as was the case with security, that we did not consider ourselves wholly competent to judge this, and the Commission itself would have to weight it in any manner they saw fit. How heavy a weight they placed on it, I do not know.

Representative DURHAM. Did you visit any of the other plants that are operating at the present time?

Mr. MACKENZIE. I have been to two of them, but not from the standpoint of studying or learning anything about them. I merely saw the office at the gate, and that is about all. We are not familiar with the internal lay-outs.

Representative DURHAM. It probably would have been helpful to you in deciding some of these factors, because we have had drainage problems, and we have had contamination problems, and so far we have had no accidents.

Mr. GRUBB. That is right, sir.

The CHAIRMAN. Mr. Grubb, in an effort to speed this thing up: Who made this listing of these factors? Who listed these factors for you to arrive at a formula? Yourselves?

Mr. GRUBB. I think it can be said that we prepared this list from a list of factors that was specifically mentioned in the contract under which this work was performed.

The CHAIRMAN. Well, let us quickly go through the list for the factors that you adjudge to be of importance. Isolation certainly is one.

Mr. GRUBB. And climate.

The CHAIRMAN. Climate. Security is out, because you were not competent. Climate, you think, is important. Geology?

Mr. GRUBB. Yes.

The CHAIRMAN. That is important. Drainage?

Mr. GRUBB. I think it is important; yes.

Senator HICKENLOOPER. I have marked drainage off my list, Mr. Chairman, because they say that they are not competent to judge the drainage factor.

The CHAIRMAN. I think you are right. Water supply?

Mr. GRUBB. That is important.

The CHAIRMAN. Well, they are both marked "very good," so we can mark that out.

Mr. GRUBB. It is even.

The CHAIRMAN. Manpower?

Mr. GRUBB. It is very important, but neither one had a very high rating.

Senator MURRAY. We can furnish all the employees you want. We did at Fort Peck; 20,000.

The CHAIRMAN. Let us continue the list, and then go back.

Senator HICKENLOOPER. I wonder if he would care to specify why he listed one in one way and one in another?

Mr. GRUBB. I would like to make a comment on the offer of the Montana people to supply all the labor needed in this project. It is anticipated that a labor total of some 10,000 people will be required in the construction of this plant, construction people. The Labor Department records for the State of Montana show approximately that number of construction people for the entire State, and within a 200-mile radius of Glasgow there are available less than 4,000 construction workers.

Senator MURRAY. But we have them in the State of Montana, and we are accustomed to traveling out there, so a little distance of a few hundred miles to get a job is not going to hurt anyone.

Mr. GRUBB. I think the point is that the total number of construction workers available within the State is barely in excess of the amount that would be required for this project.

Representative PRICE. Does not the construction contractor bring the workers in from all over the country?

Mr. GRUBB. Most assuredly. And we recognize that both places will have to draw on distant points for their labor supply.

The CHAIRMAN. Then why did you make it "poor" in the case of Fort Peck and "fair" at Pocatello?

Mr. GRUBB. Pocatello has a larger number of construction workers resident within a 200-mile radius of the site, approximately two and a half times as many as are available within the corresponding radius around Glasgow.

The CHAIRMAN. How many in the 200-mile radius?

Mr. GRUBB. At Pocatello? About 10,000. At Fort Peck, less than 4,000.

Furthermore, Salt Lake City, which is a fairly large city, is about 200 miles distant, or slightly over.

In addition, within a radius of a hundred miles around the Pocatello site, there are a fairly large number of fair-sized communities.

Senator ECTON. Did you confer with the heads of the labor organizations in Montana on this labor situation?

Mr. GRUBB. I believe we did.

Senator MURRAY. Did you contact the State unemployment compensation commission?

Mr. GRUBB. I believe we did. I won't be specific, though. I can't be.

Senator MURRAY. They made a serious study of the labor sources, and guaranteed 10,000 workers, and we now have on the unemployed rolls in Montana three or four thousand people.

Mr. GRUBB. Perhaps so. But surely they are not all construction workers. The nature of the industrial work in Montana and in Idaho, too, perhaps, is that it is dependent to some extent on agricultural production, and such work is necessarily seasonal. Perhaps later

in the year, when agricultural products are being processed, you won't have such a large number of unemployed?

Senator MURRAY. I cannot see that that is an important factor, because whenever we have had occasion to require a great number of workers for a project, we have had no difficulty in getting them. We have 3,000 working up at Hungry Horse Dam now.

Representative MANSFIELD. And we will have pretty close to a thousand at Canyon Ferry very soon. We have a surplus of labor in the Hungry Horse area. We can take care of them. They are construction people who have come in looking for jobs, and of course, as far as the situation at Glasgow-Fort Peck is concerned, we would have no trouble at all getting the necessary labor.

Mr. GRUBB. I think you could make the same general sort of statement about Pocatello.

Senator MURRAY. Then it ought to be a 50-50 proposition here.

Mr. GRUBB. On the basis of the survey, Pocatello is far superior.

The CHAIRMAN. How about materials?

Mr. GRUBB. I would say in regard to materials that we don't know, except in a general way, what is going into this plant. Cement, steel, concrete aggregate, and the like are certainly going to be used in large quantities, as well as steel in many forms—pipe, fence, reinforcing steel, and structural steel. For most of those items there are points of supply closer to Pocatello than is the case with Fort Peck.

Consider for a minute a couple of them. The source of supply for concrete aggregate for the Fort Peck Dam was Cole, Mont., which is some 40 miles or so from Glasgow, I believe it is.

Senator MURRAY. I understand at the last hearing a statement was submitted showing the access to raw materials that will be needed in this work. I have no recollection of what the facts are, but they are in the record here.

Mr. GRUBB. I don't know that we have had time to read your exhibits too carefully, but let me say that in the case of the Fort Peck Dam the aggregate was taken from Cole, Mont., from the deposit at Cole, Mont., some 40 miles distant from Glasgow. At Pocatello aggregate is available substantially on the site. Within the area there are numerous pits where gravel has been screened and is being used. All the gravel that was used in the Navy installation was obtained locally and on the site.

Representative MANSFIELD. What about cement?

Mr. GRUBB. Cement? We were informed by the cement plant at Trident, which is the obvious source of supply for the project at Fort Peck, that they are pretty well tied up. They are committed to the Hungry Horse Dam for the next 2 years.

Representative MANSFIELD. We have a cement plant at Lewistown, as I recall, and also Henry Kaiser came into Montana last year in the vicinity of Helena. He is contemplating setting up a \$6,000,000 plant for the manufacture of cement.

Mr. GRUBB. Perhaps so. Those plants don't produce too much cement.

Representative MANSFIELD. But he has a lease on all the ground and he is a go-getter and he could put the stuff out if there was a market for it in Montana.

Mr. GRUBB. Be that as it may, building that is not an overnight job, and we were concerned with sources of supply—existing sources of supply.

At Idaho, there is a plant at Inkom, which is just outside Pocatello—quite a bit closer.

Senator MURRAY. We had an expert here at the hearings we held a short time ago, Mr. Brown, who said that all of these materials would be supplied more easily and cheaply at Fort Peck.

Mr. GRUBB. I don't think that is a fair statement of the facts.

Senator MURRAY. I beg your pardon?

Mr. GRUBB. I don't think that is a fair statement of the facts. I don't think that is quite true.

Senator MURRAY. You think this man, Mr. Brown, was not telling the truth at that time?

Mr. GRUBB. Perhaps he was mistaken.

Senator MURRAY. He certainly impressed us as being a man who knew what he was talking about. He was familiar with the conditions around there, and spent a great deal of time in that area, whereas you people have only spent a few hours at Fort Peck and Glasgow.

Mr. GRUBB. Or days.

Senator MURRAY. It seems to me that a man who lives in that area and has reason to know these facts would be more reliable than someones who comes from Detroit, Mich.

Senator ECTON. Is it not the truth, Mr. Grubb, that to have written this report you would not even need to have gone to Glasgow or Fort Peck?

Mr. GRUBB. No; I don't think so. It is not true.

Senator MURRAY. Well, your trip to Glasgow did not do you any good. Here is an affidavit from Montana that says:

Paul J. Campbell, of Glasgow, Mont., being first duly sworn on oath, deposes and says:

That he is now, and for more than 10 years immediately prior to signing this affidavit has been, the manager of the Glasgow Hotel, of Glasgow, Mont.; that affiant further declares that the registration cards appearing below and bearing the respective names of Frank L. Couch, of Detroit, Mich., and Donald H. Maxwell, of Chicago 6, Ill., are exact copies of the original registration cards appearing of record in the files of said Glasgow Hotel; that affiant made the said copies appearing below herein.

So here are the registration cards, which show that you were there for 1 day, on the 13th of January. And the climatic conditions were such that you were unable to visit the actual site of the project.

I have another affidavit here from Montana by Mr. Charles E. Myers. It says:

That affiant is now, and has been for more than 2 years, the manager of the Texaco service station located at Fort Peck, Mont.

That on or about the 13th day of January 1949, a certain Mr. Donald H. Maxwell hired affiant to drive him from Fort Peck, Mont., to a place Mr. Maxwell referred to as "the Willow Creek area"; that at about 9 a. m., on said day, affiant and Mr. Donald H. Maxwell left Fort Peck, Mont., by automobile and followed the route set out by affiant in red pencil on the attached map; said map bearing affiant's signature, and herewith incorporated as a part of this affidavit; that affiant and Mr. Maxwell returned at noon of said day.

That at no time during the afore-mentioned trip did affiant drive Mr. Maxwell north of the route set out in red pencil on said map, nor did Mr. Maxwell request him to do so; that when affiant had driven Mr. Maxwell to the vicinity indicated by the most southwestern red dot on said map, he was instructed by Mr. Maxwell to return to Fort Peck, for they had "gone far enough."

And the map shows that you have not reached the site of the so-called project.

Mr. GRUBB. How do you know what the site is?

Senator MURRAY. Well, the site is marked right here on the map, where they are proposing to locate it. Here it is right here.

Mr. GRUBB. Where does that information come from, sir?

Senator MURRAY. It comes from the people in Fort Peck who were undertaking to show where this site could be located on Government land.

Mr. GRUBB. Substantially all of that enclosed within your red line is Government land?

Senator MURRAY. Yes.

Mr. GRUBB. The specification for the site location, I am quite sure, however, is in error.

Representative PRICE. How much actual time has been put into this survey?

Mr. GRUBB. How much time?

Representative PRICE. Yes.

Mr. GRUBB. That is difficult to answer. We have had somewhere around 15 people for 2½ months.

Senator HICKENLOOPER. How much actual time was spent in Montana, by anybody? I mean in connection with this.

Mr. GRUBB. Three people drove within the general site boundary.

Senator HICKENLOOPER. How much time did they spend there?

Mr. GRUBB. At least a day, and some of them 2 days, but I cannot now remember and state definitely.

Senator HICKENLOOPER. How much time was actually spent on the ground of the proposed site in Idaho?

Mr. GRUBB. About the same.

Senator MURRAY. You have included a map or plat in the record here, which purports to show the location of the site.

Mr. GRUBB. It shows the site boundary.

Senator MURRAY. The site boundary. And this plat that I am showing you here is right at that point where you assumed the site should be located?

Mr. GRUBB. That was an assumed center of the site, I believe, which we had to use for purposes of establishing characteristics of the area within certain radii of that point. That point does not indicate that a reactor or a number of reactors would be erected at that location. Presumably they would be spread throughout the area.

Senator MURRAY. But it would be in that immediate vicinity?

Mr. GRUBB. Not necessarily, sir.

Senator MURRAY. Where would they be then?

Mr. GRUBB. Anywhere within that area.

Senator MURRAY. Anywhere within the area. Anywhere within this area that is marked on your plat?

Mr. GRUBB. Within the whole large area. That is right.

Senator MURRAY. And that entire area is in the vicinity of Glasgow?

Mr. GRUBB. Correct.

Senator MURRAY. And it is the place where you went to investigate and were not able to investigate because of the climatic conditions, the snow on the ground?

Mr. GRUBB. There are many things which you can determine about an area, which you can learn regardless of whether it is covered with snow, or raining, or the sun is shining.

Senator MURRAY. I see.

Senator HICKENLOOPER. Mr. Chairman, at this point, in view of the statement that the witness made that 1 day was spent in the vicinity of Fort Peck, or maybe 2 days, and that about the same time was spent in the vicinity of the location at Idaho, it seems to me that there should be some criticism directed at somebody who will take a survey of 1 day, or 2 days at the outside, at a place where we are proposing to build installations of great permanence, and that will cost millions upon millions of the public money.

I am not saying that the survey did not spend adequate time there, necessarily, but it seems that the physical examination of the ground at each place was certainly a lick and a promise. Maybe it was not. Maybe my criticism is unfair. But it certainly indicates an extremely short time to examine two tremendous areas with all the factors of geology and drainage and all the other matters involved, upon which a decision for millions of dollars worth of installation of a vital public project is based.

Mr. GRUBB. I think my remarks were not completed, sir.

Senator HICKENLOOPER. I am sorry.

Mr. GRUBB. I was saying that three of our people went within the site boundary, insofar as they were able to, considering the weather.

Senator HICKENLOOPER. Well, right there: How much time did they spend within the site boundary?

Representative PRICE. And what were their qualifications? Were they engineers?

Mr. GRUBB. Geologists and hydrologists.

Senator HICKENLOOPER. How much time did they spend within the site boundary?

Mr. GRUBB. Each one, the better part of a day.

Senator HICKENLOOPER. Did they go in there separately, or together?

Mr. GRUBB. I think they went in together, or at least in two parties.

Senator MURRAY. Were they driven in by this man who makes this affidavit here?

Mr. GRUBB. I do not know.

Senator HICKENLOOPER. There was the better part of a day spent within the site boundary by perhaps three men at the Fort Peck area?

Mr. GRUBB. That is right.

Senator HICKENLOOPER. How much time was spent within the site boundary, or the proposed site boundary in Idaho, and how many men were there?

Mr. GRUBB. About the same amount of time.

Senator HICKENLOOPER. So that the better part of a day was spent looking over the general physical site of the area in Idaho.

Mr. GRUBB. Yes.

Senator HICKENLOOPER. Then I withdraw my statistics in my calculation of a while ago, and I will say that it is even less time than I thought to have been spent.

Mr. GRUBB. They were concerned, however, with only one phase of the problem. That was geology and the general topography of the land. Other persons who were concerned with other phases of the problem were also in each of the areas.

Senator HICKENLOOPER. As I understand it, the snow was on the ground up there, was it not?

Mr. GRUBB. That is right.

Senator MURRAY. Mr. Chairman, I understand that Mr. Shugg of the Commission, and Mr. Warner and Mr. Stearns, the geologists, never went on the ground, never visited the Fort Peck site at all. It seems to me that they should have gone there themselves and visited the proposed site. It seems to me they were competent people to make a personal investigation of this situation, and that they should have gone there themselves.

Mr. GRUBB. Mr. Stearns was on the site.

Senator MURRAY. Mr. Stearns was on the site? When was he on the site?

Mr. GRUBB. At about that time.

Senator MURRAY. My understanding is, from the last hearing, that none of them were on the site.

Mr. GRUBB. I do not recall that point being raised.

Senator HICKENLOOPER. Mr. Johnson, on behalf of the Commission, made a survey in the Fort Peck area.

The CHAIRMAN. Well, gentlemen, we have covered the social factors, have we not? There has been some discussion about the recreational factors. Now, on the matter of the land, since it is very good for both of them, that would seem to be out. Cost would seem to be the next item, in which it is fair for Fort Peck and good at Pocatello.

Senator MURRAY. I do not see how it could be good at Pocatello if it is going to cost the Government more to locate the site at Pocatello. I do not see how you could regard that as good unless spending the public funds unnecessarily is regarded as good.

The CHAIRMAN. Let us have Mr. Grubb give his classification, of course, if he can, as quickly as possible.

Mr. GRUBB. Let's say first that we were familiar only with the general nature of the facilities to be erected. We had seen no drawings at this time. We knew, of course, as we have already said, that large quantities of concrete, steel, reinforcing steel, and the like, were to be used. We formed some idea, within our own organization, and one of our men who was competent at estimating, at judging these factors, went into the field, to discuss with contractors who have worked in both areas, the difficulties which might be encountered, considering the availability of materials, manpower, climate, housing, and the like.

The consensus of all opinions was that the construction would cost more at Fort Peck.

The CHAIRMAN. You made a very exact dollar estimate of the difference, did you not?

Mr. GRUBB. We evaluated those differences as a 91½ percent difference favoring Pocatello.

The CHAIRMAN. Can you give us the list of factors that went into making that estimate?

Mr. GRUBB. Well, certainly. Those factors were labor, availability of construction materials—

The CHAIRMAN. Labor, I should imagine, would be about the same in both places, would it not? Do they work cheaper at Pocatello, than they do at Fort Peck?

Mr. GRUBB. Published labor records were about the same. The experience was that turn-over of labor was somewhat higher in Montana, resulting in a higher cost.

The CHAIRMAN. That is No. 1. No. 2 was what?

Mr. GRUBB. Availability of construction materials.

The CHAIRMAN. How did you work that?

Mr. GRUBB. That was favoring Pocatello. The third related to excavation. It was felt that the excavation, removal of overburden, was somewhat simpler at Pocatello, and on the other hand at Fort Peck the matter of sealing the freshly exposed shale would be necessary. We rated that item in favor of Pocatello.

The fourth item was nearness to existing railroads and highways.

The CHAIRMAN. That comes under transportation, does it not?

Mr. GRUBB. Well, it is a factor in construction costs.

The CHAIRMAN. Yes, that is right. It would be.

Mr. GRUBB. At Pocatello, the railroad and highway both run through a corner of the site. The construction of roads there is not too difficult, and it would appear that there is some advantage to Pocatello in that case again.

Representative MANSFIELD. May I interrupt, there, Mr. Chairman?

Glasgow is on a main line. You have good highways out there. The Arco site is not on a main line, and I do not think your roads down there would compare to what we have in the Fort Peck-Glasgow area. So I do not see where you get the advantage there.

Mr. GRUBB. The roads at Pocatello enter the site right now.

Representative MANSFIELD. What kind of roads are they?

Mr. GRUBB. Well, U. S. 20 from Blackfoot to Arco is a good hard-surfaced road.

Representative MANSFIELD. Is it paved?

Mr. GRUBB. Yes, sir.

Representative MANSFIELD. All right. But you have Arco 87 miles away on a branch line from Pocatello. And Glasgow is right on the main line.

Mr. GRUBB. Perhaps so. I don't think that makes too much difference as to the railroad, though.

Senator MURRAY. We had a rate expert here at the last hearing who testified, and he said there would be a big saving on freight costs by selecting the site of Montana.

Mr. GRUBB. Yes, I recall that he said that. Further analysis will not, I believe, prove his case.

Senator MURRAY. I think we would say that with reference to your testimony.

Mr. GRUBB. Perhaps so.

Senator MURRAY. And with reference to your report; and if we got another group of engineers to follow your tracks, I think we could disprove about 98 percent of your report.

Mr. GRUBB. You are welcome to try, sir. I don't believe that would happen.

Senator MURRAY. You would be surprised to see what these experts do to each other. I have had a lot of experience with them.

The CHAIRMAN. Does that conclude your costs statement?

Mr. GRUBB. No, sir. There are several other items. One of them, the fifth item, is the possibility that a construction camp, which is

located near Pocatello, could be utilized in the present case, was mentioned but not evaluated.

The sixth item is the general character of the site and it was such that it would involve less expense for site clearance and drainage.

Opposed to those items there was one which favored the Fort Peck site, and that was the added expense for excavating lava at Pocatello.

The CHAIRMAN. Did you assign a percentage to each of these factors that aggregated  $9\frac{1}{2}$  percent?

Mr. GRUBB. I didn't understand you, sir.

The CHAIRMAN. Did you assign a percentage to each one of these factors that in sum total aggregated  $9\frac{1}{2}$  percent?

Mr. GRUBB. That is correct.

The CHAIRMAN. Will you read them and give us the percentage?

Mr. GRUBB. Item 1, labor, was 5 percent, favoring Pocatello. No. 2 was 4 percent.

The CHAIRMAN. What was 2?

Mr. GRUBB. Number 2 was availability of construction materials.

The CHAIRMAN. Four percent?

Mr. GRUBB. Yes. Three, a matter of excavation and sealing of footings, sealing of excavations was 2 percent. Four, relating to roads and highways existing and in the site, was 1 percent. Five was not evaluated. Six related to general character of the site and site clearance and drainage, 1 percent all favoring Pocatello. And item 7, the matter of added expense for excavating in lava was  $3\frac{1}{2}$  percent in favor of Fort Peck.

The CHAIRMAN. That makes an aggregate of  $9\frac{1}{2}$  percent?

Mr. GRUBB. Nine and a half percent.

The CHAIRMAN. Let us leave transportation for a moment and go to fuel. We will come back to transportation.

How about fuel, now? That is "fair" for Fort Peck, and "good" for Pocatello.

Mr. GRUBB. Our analysis of fuel was based on availability of various grades of coal and the delivered cost. In the cast of Fort Peck, it was found that the lowest-priced fuel on a B. t. u. basis for the quantity of steam required was about \$2,800 per day. At Pocatello, the amount of fuel required on the same basis was \$2,000 a day.

The CHAIRMAN. Let me read you a short paragraph from this memorandum:

According to the Smith Hinchman & Grylls report the laboratory will need 6,320,000 cubic feet of gas daily.

Mr. GRUBB. Of gas? Yes, sir.

The CHAIRMAN. I suppose that is coal equivalent. Do you not think so?

Mr. GRUBB. I presume it is. I don't know that we made any such statement in the report.

The CHAIRMAN (reading):

For good measure, we have brought in a well which produces 51,500,000 cubic feet of gas daily at a depth of only 1,420 feet. An immediate expansion is going forward improving the total potential of this field, but it can be said now that the nuclear reactor laboratory can have the cheapest, cleanest, and most efficient fuel in America, Montana natural gas, at Fort Peck, Mont.

Do you know anything about that?

Mr. GRUBB. Well, this 6,320,000 cubic feet is the equivalent amount of gas compared to the amount of coal which was required.

The CHAIRMAN. Mr. Skibbins tells me that field has just been brought into being since the last time we met here on this subject.

Mr. GRUBB. I see.

The CHAIRMAN. I presume, therefore, you did not consider natural gas at all?

Mr. GRUBB. We considered it very briefly. There is a gas line which runs from fields southwest of Glasgow. I guess it is from Sunburst and Shelby over to Williston. That line is overloaded, and we didn't anticipate taking any service from that line for the reactor station.

The CHAIRMAN. You mean at Arco?

Mr. GRUBB. At Fort Peck.

The CHAIRMAN. At Fort Peck.

Mr. GRUBB. Yes, sir.

The CHAIRMAN. Would the fact that this new field has been brought in, with consequent economy, influence your judgment?

Mr. GRUBB. I don't know, sir. How much is the gas going to cost?

The CHAIRMAN. Well, as to that, I would not know, but they certainly got the production, if these figures are accurate, of 511½ million feet a day, and you are going to use 6,320,000. I suppose that is figured on a B. t. u. coal basis.

Mr. GRUBB. That is right.

The CHAIRMAN. I presume that they would sell the gas for the market rates.

Senator MURRAY. Our rates in Montana are lower than in any other section of the country. We send gas three or four hundred miles in Montana. We bring gas all the way from the northern end of the State down to Butte, Mont., where I live.

The CHAIRMAN. Right now the Commission has a project under consideration for building a gas line at Oak Ridge, costing some \$20,000,000. Apparently the Commission gives considerable weight to the value of having that natural gas.

Mr. GRUBB. Is it for the plant or for the residences?

The CHAIRMAN. No; we are bringing it in for the plant. We are not up to \$20,000,000 for the residences yet, no.

Mr. GRUBB. Getting back to your question: Before the use of such gas could be evaluated, we would want to know how much it cost.

The CHAIRMAN. I assume that it would be the going market rate. What is the rate? Does anybody here know what the rate is for 1,000 cubic feet?

Mr. SKIBBINS (G. J. Skibbins, industrial consultant, Montana Chamber of Commerce). It is in the low 10 percent of the Nation. I can't give you the exact rate now, but I know it is in the low 10 percent of all the gas rates of the United States.

Mr. GRUBB. In evaluating the gas here, we assumed an estimated cost of 50 cents a thousand feet.

The CHAIRMAN. Of course, I do not know whether it is so or not, but there might be a contract made on the basis of using 6,000,000 cubic feet a day.

Mr. GRUBB. That is possible, sir.

The CHAIRMAN. That would be highly advantageous.

Mr. GRUBB. Yes.

Senator ECTON. Did your company look into the possibility of obtaining coal at Garrison Dam? I understand that the Army engineers

have uncovered 6,000,000 tons of good coal there, and they do not know what to do with it. That is not very far from the Fort Peck area.

Mr. GRUBB. Yes, sir. Testimony at the last session of the hearing indicated that that coal could be delivered from Garrison to Fort Peck or Glasgow for about \$3 a ton; and on the basis of 500 tons a day it was shown that that would cost \$1,500, which would be less than the fuel cost at Pocatello.

Senator ECTON. Less? You mean less than at Pocatello?

Mr. GRUBB. Yes. That is on the basis of the freight cost only. However, I presume that coal is lying on the ground or in the ground somewhere, and that somebody is going to have to pay for taking it out and putting it in cars and grading it and cleaning it and washing it, or doing whatever else is necessary. And before it is done, the 500 tons a day are going to be dissipated and some more put back in, in order to deliver coal at Fort Peck.

Senator HICKENLOOPER. What is the cost of delivering coal at the Idaho site?

Mr. GRUBB. Well, it is a little difficult to answer that, because the B. t. u. value of the coal available at each of the places is not the same.

Senator HICKENLOOPER. The transportation costs ought to be the same.

Mr. GRUBB. It won't be, no. On the basis of a certain number of B. t. u.'s delivered, we anticipate that the cost for fuel, for coal, at Pocatello, would be approximately \$2,000 a day. That is taking it from the most economical source. At Fort Peck, the coal, from the most economical source, is \$2,800 a day.

Senator ECTON. Did you make any inquiry as to the coal-strip mines there in Montana, south of the Fort Peck site? Those are the most efficient mines in the whole world.

Mr. GRUBB. Yes, we did.

Senator ECTON. It is a fine grade of coal. What did they offer to supply?

Mr. GRUBB. I don't now recall. It does not appear here, and I assume that it was somewhat higher than the other minimum cost.

Senator ECTON. But you did go into that?

Mr. GRUBB. Yes.

Representative MANSFIELD. This is the coal mined by the Northern Pacific Railroad at Colstrip south of Forsyth?

Mr. GRUBB. That is the one. It is in the southern part of the State.

Senator HICKENLOOPER. How far are the deposits where you would get the coal?

Mr. GRUBB. The nearest source is less than 200 miles, I would estimate.

Senator HICKENLOOPER. How far is this source of coal uncovered by the Army engineers in Montana from the site?

Mr. GRUBB. Well, it is difficult to say. Some is between 250 and 300 miles.

Senator HICKENLOOPER. Some place between 250 and 300 miles?

Mr. GRUBB. Yes.

Senator MURRAY. From Garrison to Glasgow?

Mr. GRUBB. Yes.

Senator MURRAY. It is not any such distance from Fort Garrison to Glasgow. I think it would be in the neighborhood of 200 miles.

Mr. GRUBB. It is 170 miles to Williston, or a little better, and from Williston to Glasgow by rail must be another 100 miles.

Senator ECTON. Mr. Chairman, if I may, I would like to ask Mr. Grubb another question on this coal at Colstrip.

Your chart opposite page 143, I believe, does not show that you ever contracted the Colstrip people to get a price, does it?

Mr. GRUBB. Yes. I don't now recall why this wasn't filled in. I do now recall that we did contact the Colstrip people, however.

Senator ECTON. I question it, for the simple reason that it is blank.

Mr. GRUBB. I can see why you question it. I can assure you that that contact was made. I don't now remember why the data was not filled in.

Senator ECTON. You do not remember what the offer was?

Mr. GRUBB. I beg your pardon, sir?

Senator ECTON. You do not remember what the price was?

Mr. GRUBB. No. It was more than the minimum cost from Carbon County, Mont., however.

Representative MANSFIELD. May I ask the gentleman a question?

On the basis of the information brought out about these new coal deposits at Garrison, plus the fact that we have a great deal of electric power at Fort Peck, that would seem to indicate to me that as far as both hydro- and steam-plant facilities are concerned, there would be plenty of power at Fort Peck to take care of this project.

Getting back to the gas situation, does not the new gas field at Roundup, available at low rates, change all of the fuel costs in favor of the Fort Peck area over the Arco site?

Mr. GRUBB. Not necessarily. We don't know anything about the low rates. Furthermore, there is no steam power at Fort Peck.

Representative MANSFIELD. No; but you could create steam power through the building of a plant and the bringing in of this coal which is being dumped, at the present time, because there is no market for it, at the Garrison Dam site.

Mr. GRUBB. We could do many things. Again, let us get back. We were judging these sites on the basis of what is there now.

Representative MANSFIELD. That is true.

Mr. GRUBB. As far as power is concerned, there isn't the tremendous surplus of power at Fort Peck, either, that perhaps you would have us believe.

Representative MANSFIELD. Well, I disagree with you there, because there is a surplus of power at the present time which is under lease to the Montana Power Co. on a temporary basis, but all of that could be used for the construction and maintenance of this plant, and we could be able to generate well in excess of 85,000 kilowatts of power at that site.

Mr. GRUBB. Well, do you wish to discuss power now, Mr. Chairman?

The CHAIRMAN. I think so. As to electrical power, of course, there is not much use in going into it, because you listed it "very good" in both places.

Representative PRICE. But you give the preference to Pocatello?

Mr. GRUBB. On the basis of rates.

Senator ECTON. Where did you get that rate at Pocatello?

Mr. GRUBB. About the same place we got the rate at Peck.

Senator MURRAY. The Fort Peck rate is a Government rate?

Mr. GRUBB. Fort Peck? Five and one-half.

Senator ECTON. What was it at Pocatello, that you figured?

Mr. GRUBB. Let me say first that there were a number of statements made about the capacity of the Fort Peck Dam. Presently there are 50,000 kilowatts installed, two units, one 15,000 and the other 35,000. And a contract has just been let for another 35,000 unit, which will bring the total, some 2½ or 3 years hence, up to 85,000. Now, that is designed maximum capacity for the Fort Peck Dam. In order to attain this figure of 105,000, it will be necessary to tear out an existing 15,000-kilowatt unit and replace it with a new one.

Senator MURRAY. No, we are building another project at Canyon Ferry, which would be concluded about the time this would come in.

Mr. GRUBB. Well, as near as I recall, it was stated pretty definitely that plans were made, already made and perhaps already in progress, for installing 105,000 kilowatts at Fort Peck. I think that is in error, and might well be cleared up. I do not think that is the case.

Representative MANSFIELD. As I understand the Fort Peck power picture, that is what is contemplated to finally get the full hydro benefit out of that dam, 105,000 kilowatts of power.

Mr. GRUBB. That appears to be the maximum potential at that point. Perhaps it might be a little more. There is some difference of opinion.

Representative MANSFIELD. Surely that is more than enough power to take care of this atomic plant.

Mr. GRUBB. It is if you forget the purpose for which the dam was built. The dam was built to supply power for irrigation, and by 1953, I guess it is, or thereabouts, the irrigation load is expected to be some 55,000, as I recall. Yes. Commitments for irrigation are expected to exceed 55,000 kilowatts by 1953.

Furthermore, in the meantime, Fort Peck is intended to supply power for construction to Garrison Dam, and Garrison won't come in for another 5 or 6 years, I guess. Admittedly, Garrison is a very large project. But in the meantime, it is going to be a drain on the Fort Peck system; not an aid.

Senator ECTON. Why did you worry about how much power there was, when Mr. Shugg, I think it was, of the Atomic Energy Commission, and Dr. Raver, both told us that for the first 2 years that new plant in Idaho would not need over 4,000 kilowatts?

Mr. GRUBB. That is right.

Representative MANSFIELD. Which would be supplied through Diesel engines.

Senator ECTON. Yes, if necessary.

Mr. GRUBB. For the first few years, admittedly the power demands are going to be low. However, we had to hang our hat on something, on which to judge this thing, and to see how well it met the requirements.

Now, it is anticipated that the ultimate requirements for the project will be in the order of 70,000 kilowatts.

Senator ECTON. After it is constructed and operating?

Mr. GRUBB. After it is constructed and operating. It is fairly uncertain, but we look forward to it in a matter of 6 or 7 years.

Senator ECTON. In determining the cost, what did you figure the kilowatt rate in Idaho to be, as compared with the Montana rate at Fort Peck?

Mr. GRUBB. We figured in Idaho the power would carry a rate of 3½ mills per kilowatt.

Senator ECTON. Did you get that from Idaho Power?

Mr. GRUBB. We got that from the Department of the Interior.

Senator ECTON. The Department of the Interior does not have any electricity there now?

Mr. GRUBB. They have some. It is all marketed through Idaho Power Co., as I recall.

Senator ECTON. Well, not that much, to take care of 60,000 or 70,000 kilowatts, surely.

Mr. GRUBB. That is true. Not at the moment, at any rate. On the other hand, they, too, have a lot of projects there planned, and some under construction, and more to be started.

Senator MURRAY. That is on the basis of those projects that will be developed later on, that you get the idea that you can get the power cheap, then?

Mr. GRUBB. Well, we recognize that the Federal power program is being expanded, and that any large Government demand is bound to be supplied, either directly by Federal power, or by Federal power transmitted over privately owned transmission lines. And so the rate established by the Federal power authorities, the Department of the Interior and its branches, is bound to govern the rate at which power will be charged to this project.

Senator ECTON. So this three and a half mill rate is based on figures submitted by the Bureau of Reclamation?

Mr. GRUBB. Yes. Well, the Department of the Interior, Bureau of Reclamation.

Senator ECTON. On power that has not even been developed yet?

Mr. GRUBB. Yes. They also made the same statement at Fort Peck: On power that isn't developed yet. They further went on to say that there would always be a rate differential of about 2 mills between power at Fort Peck and power at Pocatello, the difference being that the dams are somewhat less costly in the Idaho area and the transmission lines are generally somewhat shorter. The centers of use are larger. Certainly we could not ignore those factors.

Senator MURRAY. Did they make a written statement of that character?

Mr. GRUBB. Yes, sir.

Senator MURRAY. Where is it? In your records?

Mr. GRUBB. I don't believe we have it.

Senator MURRAY. But you have a written statement from them offering to give you the power at that rate?

Mr. GRUBB. I don't believe that that is what the written statement said. The written statement said that there would always be a difference in rate of about 2 mills between Fort Peck and Pocatello, and that Pocatello would be the cheaper.

Representative DURHAM. These are the only two sites you evaluated at all?

Mr. GRUBB. That is right.

Representative DURHAM. That is, the only ones you were asked to evaluate by the Commission?

Mr. GRUBB. Yes, sir.

Representative DURHAM. The policy has been, of course, that you establish these plants where the power is already available. That

has been the policy to begin with. It looks like we are departing from a policy here that has been pretty well established.

Mr. GRUBB. I would not presume to answer the question you raised. However, power is short throughout the Pacific Northwest, as you probably well know.

Representative DURHAM. Fuel and power are highly important in the operation of these plants?

Mr. GRUBB. Yes, sir.

Representative DURHAM. It is an important factor.

Mr. GRUBB. It certainly is.

Senator ECTON. Mr. Chairman, what I wanted particularly to bring out is this: We want to find out where they got this  $3\frac{1}{2}$ -mill rate. At some of these hearings I understood that they had it from the Idaho Power Co. I sent a wire to the Idaho Power Co., and they sent this back. They said:

Our company has publicly announced both its willingness and availability to furnish power requirements for new atomic plant. Ultimate rate depends upon size of load, annual load factor, delivered voltage, and other service conditions, regarding which final engineering information not yet available.

IDAHO POWER Co., Boise, Idaho.

So, what I am getting at is that this  $3\frac{1}{2}$ -mill rate was a rate which is merely in the making.

Representative D'EWARD. Will the Senator yield to me?

I think it was brought out earlier in this hearing that Bonneville Power had no intention of serving this plant, and this is a Bonneville rate that has been quoted.

Mr. GRUBB. That might well be true. I think that Bonneville looks upon the Snake River and the Columbia River Valley more or less as one system. But, in any case, those are the figures on which we had to work. Now, we were as unsuccessful as you were, Senator Ecton, in getting any statement as to rates out of any of the private power companies, whether it was Montana, Idaho, or Utah. They just won't talk until you know definite figures, as to quantity and the manner in which the load will develop.

Representative PRICE. Specifically, who would furnish the power to the Pocatello site, the Idaho site?

Mr. GRUBB. Two private companies are in there now, Idaho and Utah.

Representative PRICE. And you would have to get the power from them?

Mr. GRUBB. That is correct, sir.

Representative PRICE. And they have not given you any rate?

Mr. GRUBB. No, sir.

Representative PRICE. Where does the  $3\frac{1}{2}$ -mill rate come in?

Senator ECTON. The only possibility, it seems, would be to build a line from Spokane into Pocatello, about 600 miles, or bring it from Hungry Horse down through Montana to Pocatello, about 400.

Mr. GRUBB. Well, within the territory covered by the Idaho Power Co., there are, I guess, sites having potential capacities of well over a couple of hundred thousand kilowatts.

Representative PRICE. Mr. Grubb, you said that power was very good at both Pocatello and Fort Peck. You said the difference, the reason you concluded that you preferred Pocatello over Fort Peck, was on the matter of rate. But you say now that you do not have any

rate for the Idaho site. So, how could you establish a preference on the basis of rate?

Mr. GRUBB. We recognize that the public power will be expanded and that most assuredly public power would ultimately be used in this project. Now, the rate for public power at these two locations, we are informed by the Department of the Interior, is going to carry a differential of 2 mills.

Representative MANSFIELD. Would the gentleman yield there?

In response to the question raised by Senator Ecton, as I interpret it, the implication was made that there was a possibility that power from Hungry Horse would go down to this proposed plant at Arco if it is located there.

I want for the record to emphatically and unqualifiedly deny that that will be the case, and to call to the attention of the committee a letter which I inserted in the hearings 2 or 3 weeks ago, dated March 29, as follows:

DEAR CONGRESSMAN MANSFIELD: At the meeting you attended with the Montana delegation at the Commission offices on March 22, certain questions relative to the AEC power requirements for the proposed reactor test station were discussed.

You will recall it was stated at that time that we planned to obtain the power for the station from generating equipment installed at the station and from the Idaho Power Co., which will be supported by the plants of the Bureau of Reclamation, either existing or under construction in the Snake River Basin in Idaho.

As you know, the Idaho Power Co. purchases some power from existing plants operated by the Bureau of Reclamation and by the Montana Power Co. Both the Idaho Power Co. and the Bureau of Reclamation have new plants and facilities under construction along the Snake River in Idaho, which we believe will be adequate to meet our needs projected over the next several years.

I am further advised by my staff that we have not entered into negotiations with the Bonneville Administration for power for the test station. We do not plan to obtain power from the Hungry Horse project or from the Montana Power Co. Furthermore, we do not expect to require special transmission facilities to bring in out-of-State power to the test station.

Very truly yours,

UNITED STATES ATOMIC ENERGY COMMISSION,  
DAVID E. LILIENTHAL, *Chairman*.

So, I hope that that letter will lay some of the statements at rest, because, as far as I am concerned, I am not boosting these transmission lines, nor the Hungry Horse, nor any other project in Montana, for the purpose of using our power in Oregon, Idaho, Washington, or Utah. Montana power should be used in Montana only, for the development of our State, and that is my contention; and, as far as I am concerned, this power is not going down into Arco.

Mr. GRUBB. May I ask a question, sir?

Representative MANSFIELD. Surely.

Mr. GRUBB. Are public funds used for the construction of the dams?

Representative MANSFIELD. Yes.

Mr. GRUBB. Then certainly the public has some right to use the power.

Representative PRICE. Reclamation, however, is more or less of a loan proposition. The people in the area pay that back into the Treasury.

Mr. GRUBB. Whoever uses the power pays for it.

Representative PRICE. That is right.

Representative MANSFIELD. But the people of Montana are the ones who are going to pay for these projects, and they are the ones who are going to get the use of the hydroelectric facilities.

Mr. GRUBB. If they use it all, then presumably they are going to get it.

Representative MANSFIELD. We will use it all and a lot more.

Senator ECTON. Mr. Grubb, in order to clear it up, what concerned some of us was this fact: We felt that we had available now, and will have within the next year or two, all the necessary electricity at Fort Peck that this plant will use.

Mr. GRUBB. I think the same statement can be made for Pocatello.

Senator ECTON. And we could not see any justification for building an additional 230-kilowatt line for several hundred miles to supply a plant in Idaho at an additional cost of, oh, \$40,000 or \$50,000 per mile, when we already had the necessary number of kilowatts on the site, practically. That is what we have not been able to reconcile in this whole deal, if electricity was one of the major factors.

These engineers have told us that electricity was not one of the important things; other engineers have told us that. Mr. Lilienthal told us that; that electricity was not the essential thing in the determination, and also Mr. Shugg, inasmuch as they would not need more than from 4,000 to 10,000 kilowatts. But now you come in here, as an engineering firm, and tell us that when it all gets set up they will need at least 70,000 kilowatts.

Mr. GRUBB. The demand for the first couple of years, perhaps, is in that order. However, the basis on which we have been working was that the ultimate demand would build up to the figure mentioned. Both sites can now handle the demand.

Senator ECTON. Yes; I think that is true.

Mr. GRUBB. And for several years to come.

Senator ECTON. For the next 2 years.

Mr. GRUBB. Furthermore, the experience of companies in both areas, perhaps, is that, generally speaking, if they are able to anticipate the demand, they can build to meet it in adequate time. Such time was available here, as far as that goes.

Senator ECTON. But I think Congressman Mansfield can recognize our position, too, in the face of this, when there has been so much pressure put on to bring Hungry Horse power down to Anaconda and Butte. Why, it would only be a little farther to bring it on down to Pocatello, and we have seen charts where the Power Commission, in their expansion program, intended to do that very thing.

So you can readily understand our questioning and our concern and our apprehension regarding this.

Representative MANSFIELD. That is true, I will say to the Senator, if the Senator will pardon me, but that question has been raised so many times, Senator Ecton, that I wrote both Dr. Raver and Mr. Lilienthal and got their answers in writing as to just where their power was coming from. I also am of the firm opinion, and have so stated in the record and on the floor of the house, that, as far as I am concerned, these lines are being built for the building up of Montana and not for the building up of Idaho, Utah, Oregon, Washington, or any other State.

You know, we have been in a pretty backward position for a good many years, and I hold pretty fast to the conclusion that it is about

time that we people from Montana got busy and started looking after our own interests, and developing our own interests, for our own benefit.

The CHAIRMAN. Well, you are busy, all right.

Senator ECTON. That is what we are here for.

Representative DURHAM. Is there a shortage of power in that area at the present time?

Representative MANSFIELD. Not in our area. There is a slight surplus. But that surplus is predicated on a number of factors, such as the difference in Pacific coast and mountain time, by means of which the Montana Power ships out power to Washington, and also because of the fact that part of the surplus comes from the use by the Montana Power Co. of the leased hydroelectric capacity from Fort Peck. The Montana Power also has a tie-up with the Utah Power & Light between Butte and Salt Lake, and part of that power from the Montana Power Co.'s tie-up line there goes to Arco, Idaho, for use at the Navy Proving Grounds there.

I do not know how much, or what the rate is, but that is the situation at the present time, and it is anticipated that this time next year there will be no surplus in the State of Montana, and we will begin to experience a shortage as well.

On the basis of the Hungry Horse Dam, we are tying in with the Bonneville at Grand Coulee, because, if Hungry Horse was to operate as an isolated unit, all we would get in Montana would be 77,000 kilowatts of firm power a year. But on the basis of this tie-up, we are assured of a minimum of 187,000 kilowatts of firm power a year in Montana. And the purpose of this line to Anaconda is not to extend down into Idaho or anywhere else, but to develop the phosphate and manganese deposits of Montana.

And Carl, you, as a farmer, know what phosphate means to the future of this country, and all of you know how important manganese is to the development of the steel industry.

**STATEMENT OF GERALD J. SKIBBINS, PERSONAL REPRESENTATIVE OF HON. JOHN BONNER, GOVERNOR OF MONTANA, AND INDUSTRIAL CONSULTANT, MONTANA CHAMBER OF COMMERCE, HELENA, MONT.**

Mr. SKIBBINS. To complete our testimony, I would like to introduce for the record several studies which are pertinent to these hearings.

It is our hope and our respectful request that the questions raised in these studies be answered in detail by the Commission. I am presenting this material as the personal representative of Gov. John Bonner of the State of Montana. Governor Bonner is vitally interested in obtaining adequate answers to each of these points and feels that they might be the subject matter for additional surveys on the subject of locating this reactor laboratory, along with the testimony presented by Montana at the previous hearing.

If the Commission has enough time to spend the entire year of 1949 in drilling for water while a 175-mile-long lake sits unused at Fort Peck, Mont., then there is time to make careful and responsible studies of all the plant location factors which should be considered in locating this billion dollar installation. That money is the prop-

erty of the citizens of the United States, and I feel it would be the highest expression of responsible administration for the Atomic Energy Commission to insist that every type of social, economic, engineering, and field study be completed before they come to a final decision on the location of their new installation.

The well-drilling going on at Arco is in the nature of a field exploration of underground water resources. Negotiations with the Navy Department are exploring the availability of the naval proving ground at Arco. In order to complete the information which should be available before a final decision is reached on the location of this plant, the people of Montana, through their Governor, respectfully suggest that the private engineering firm and the Commission initiate studies to answer all the questions raised at both hearings as well as all the problems and questions raised in the papers I am submitting today.

As a sovereign entity within the United States of America, the State of Montana respectfully requests that the Senate-House Committee on Atomic Energy and the Atomic Energy Commission seriously consider the advisability of this suggested procedure in order to satisfy the serious concern of the people of Montana.

If careful studies on all the subjects involved in this plant location are made, we are willing to abide by a decision made in line with those results. It is our lack of confidence in the premises which have prompted the preliminary decision on Arco, Idaho, which has prompted our recent and present actions in the matter, however, should an adequate body of knowledge be assembled on both sites, and should it clearly demonstrate that every problem involved can be more easily and economically solved at Arco than at Fort Peck, then we will consider the matter closed and will heartily congratulate the good people of Idaho.

On or about April 16 in Salt Lake City, Utah, Mr. Lilienthal released to the press a statement to the effect that the location of this plant at Fort Peck, Mont., would endanger the water in the Missouri River. We had thought that the subject of contamination of river systems was so disturbing to the public at large that it might be avoided in public statements, however, seeing that the subject has been raised, we have urgently requested a study of the matter and I submit a paper prepared by Mr. Norman J. Holter, physicist, director of the Holter Research Foundation at Helena, Mont., and formerly senior physicist in charge of wave measurements with the Bikini expedition. Mr. Holter makes no claim to ultimate wisdom on the subject but he does say, in effect, that it can be argued that the Fort Peck site offers greater protection in the event of an industrial catastrophe than does the Arco site.

Briefly, here is the argument. In the event of the falling apart of a reactor, fission products and primary fuels will be scattered some distance. At Arco, this material will percolate into the lava beds and reach the Snake River 75 years later, according to the Smith, Hinchman & Grylls report. By this time most of the short-lived fission products will be dissipated, it is true, but the tons of primary fuels, uranium or plutonium—which are extremely dangerous in even small concentrations when taken internally—will not lose their radioactivity for thousands or millions of years. Seventy-five years will

have no effect on their potency. How has the Commission decided to control these contaminating products underground where they will be flowing down old channels of the Snake River? What if my previous testimony regarding a show of coliform contamination in the Thousand Springs area proves correct and fission products only take a very short time to reach the Snake River?

At Fort Peck, the Smith, Hinchman & Grylls report has stated that soil is impervious. That is a distinct advantage to Montana's site. In the event of the falling apart of a reactor there, the fission products and the primary fuels would remain on top of this impervious surface. As the site is on top of a table of land with no water drainage into the area, a simple 2-foot retaining wall would prevent any possible leakage of whatever meager rainfall might occur and the flooding of the area with oil after the catastrophe would insure its protection from any winds. After a few months this area would be a valuable uranium mine which could be worth millions of dollars. The uranium or plutonium could be collected and reused to good advantage and no danger of any kind would accrue to man or beast.

I am sure that the people of Idaho ought to be seriously interested in an explanation of the contamination problem. In Montana we respectfully request that this argument be answered in detail because contamination has been used in the newspapers as a reason for the Commission's rejection of the Fort Peck site.

I submit Mr. Holter's paper on the subject which was prepared at our request in good faith.

I also submit excerpts from United States Geological Survey No. 199, entitled "Geology and Water Resources of the Snake River Plains of Idaho" by Israel C. Russell. These excerpts discuss the climate of the Arco-Pocatello area. In one paragraph, Mr. Russell discusses the high winds in the area and the phenomena of miniature whirlwinds which spiral across the area during the summer, forming tall columns of dust. This is a serious point to consider in relation to a possible catastrophe, should such a whirlwind move across the plant site after a catastrophe has occurred.

If, as Mr. Lilienthal and Mr. Pike have stated publicly, the subject of contamination is of great importance, then the measures taken to prevent it are matters of serious public interest wherever this plant is located.

Next, I wish to submit for the record a series of discussions and questions of a technical nature on the subjects of geology, topography, drainage, water supply, disposal of waste water, et cetera, dealing with both the Fort Peck and Arco sites. These questions and discussions relate directly to points in question or in need of amplification within the Smith, Hinchman & Grylls report. They might properly be regarded, along with other testimony submitted in these hearings as the subject matter for further surveys regarding the location of the nuclear laboratory.

On behalf of Gov. John Bonner and the people of Montana, let me say that we are anxious to prove to this committee and to the Atomic Energy Commission our friendliness and our eagerness to help them in this matter. Most of us in Montana are blessed with large supplies of natural gas which is the finest fuel in the world for heating and home and industrial use. You all know that the State of Montana

has every natural resources known to man in superabundance. We proved this statement when we learned that the Commission would like to have natural gas for their use in this new laboratory. We opened up an entirely new gas field in Mussellshell County, Mont., a field that is ideally located for piping gas into the Fort Peck-Glasgow area.

According to the Smith, Hinchman & Grylls report, the laboratory will need 6,320,000 cubic feet of gas daily. For good measure, we have brought in a well which produces 51,500,000 cubic feet of gas daily at a depth of only 1,420 feet. An immediate expansion is going forward in proving the total potential of this field but it can be said now that the nuclear-reactor laboratory can have the cheapest, cleanest, and most efficient fuel in America, Montana natural gas, at Fort Peck, Mont. That one fact should reverse all calculations of engineering and operating costs and place the Fort Peck site in a superior position.

Because this is a time when several very important measures are before the Congress, the people of Montana wish to sincerely thank the Senate-House Committee on Atomic Energy and its vigorous chairman, Senator Brien McMahon, for having displayed a high sense of public responsibility in hearing out our case. We are all grateful for this democratic treatment and hopeful that this entire subject of locating the nuclear-reactor laboratory will now proceed toward its logical conclusion.

(The memorandum from Mr. Holter, dated April 27, 1949, is as follows:)

Memo to G. J. Skibbins.

Subject: Possible catastrophic accident at nuclear-reactor plants.

Herewith a few quick thoughts on possible advantage of Glasgow area over the Arco area in case of explosion. It has previously been emphasized that the soil at Arco is very porous whereas that at Glasgow is very impervious. On this basis it might be argued that the Arco location provides greater hazards to those living at a distance than does the Glasgow area for the following reasons.

Whatever type of nuclear reactor is in operation it will be using some basic fuel such as uranium or plutonium. Both of these materials have long half-lives; that is, they stay radioactive for a long time—many millions of years in the case of uranium. As these materials are "burned" in a reactor they are converted to fission products which in general are more radioactive than the basic fuel elements but which have relatively shorter half-lives; that is, their radioactivity dies out much faster than does that of say uranium. Assume a large-scale industrial-type explosion (i. e., not an explosion in the atomic-bomb sense) occurring in a nuclear reactor. Among the materials scattered about by such an explosion will be the moderator (e. g., graphite) which is present in large quantities but which is harmless, the fission products existing in the reactor at the time of the explosion (highly radioactive at first but "cooling off" within a reasonable interval) and the basic fuel (present in large amounts) with radioactivity which, though less than that of fission products, does not change appreciably in millions of years.

If, as has been stated by the report of Smith, Hinchman & Grylls such materials were to seep through the Idaho soil and take as much as a hundred years to reach a surface river, it is true that the radioactivity of the fission products would by such time have decreased to a safe level but there is some question in my mind whether the tons of primary fuel will have been sufficiently diluted to prevent a hazard to health in such river. Even in a hundred years they will be essentially as radioactive as when they first started seeping into the lava. If uranium or plutonium were to reach any river or water supply which might be used for drinking, the hazard to health would be very great unless it can be conclusively shown that the concentration would be well below the tolerance level.

On the other hand, consider the Glasgow area and assume a protection screen such as a concrete wall 1 or 2 feet high surrounding the plant at a distance

great enough to contain material ejected by an explosion. Regardless of the area of such enclosure a 2-foot wall would require 2 feet of rainfall (so remote as to be considered impossible) at the time of catastrophe in order to wash dangerous materials to surrounding streams. Here likewise consider an explosion with the materials as described above scattered within the enclosure. The imperviousness of the soil if sufficiently great would prevent the materials from seeping down where they would eventually enter the headwaters of the Mississippi. If one then waited until the fission products had lost most of their radioactivity they could reenter the area and operate it as a "uranium mine" thus recovering the primary fuel rather than letting it be transported to where it might cause damage, e. g., through porous soil such as that at Arco. During the time required for fission delay, the area could possibly be flooded with a heavy viscous material which would serve to keep the material from being blown about until it could again be approached.

I do not offer the above as a workable method but to remind you that the hazard from an Arco plant might be as great or greater than at Glasgow when long-lived primary nuclear fuel is considered. The principal objection which I see to the concrete enclosure idea is that radioactive material would be carried into the headwaters by winds at the time of the explosion. This is probably a real difficulty but here again though not solving the Glasgow problem it makes Arco equally untenable if, as I understand it, there are sometimes dust storms reaching thousands of feet high in southern Idaho.

NORMAN J. HOLTER,

*Former senior physicist in charge of wave measurements with the Bikini expedition, now director, Holter Research Foundation.*

(The excerpt from the Bulletin of the United States Geological Survey, No. 199, Geology and Water Resources of the Snake River Plains of Idaho, by Israel C. Russell, is as follows:)

*Climate.*—The climate of the Snake River Plains has for its leading characteristics aridity, prevailing high temperatures in summer, and severe cold in winter. One of the most marked features in the atmospheric conditions at nearly all seasons is the great range in temperature between day and night.

The mean annual precipitation is about 13 inches, but many local variations occur. Nearly all the water that reaches the thirsty lands comes in winter and spring. During the growing season the soil is invariably parched and successful agriculture without irrigation is seemingly impossible.

The summers are decidedly hot. Not infrequently for many consecutive days and even for weeks at a time the temperature during the hours of sunshine is over 100° Fahrenheit and frequently reaches 105° Fahrenheit, and reports by local observers of 110° to 115° in the shade are not rare. Owing to the dryness of the atmosphere, however, the heat is seldom oppressive, and sunstroke is said to be unknown. Under the prevailing clear skies in summer radiation is rapid and the nights are nearly always cool. Exceptionally warm nights occur when the sky is clouded, and radiation from the heated soil and rocks is checked.

In winter the atmosphere is even clearer than in summer, as the rain and snow remove the dust which is ever present when the soil is dry. The air is cold and the temperature has a greater daily range in winter than in summer, frequently falling far below zero Fahrenheit. During the winter of 1898-99 the minimum temperature at Blackfoot was minus 30° F., and at Minidoka, minus 28° F., while the year following at Lost River, situated on the western border of the plains, in the entrance to a tributary valley, a temperature of minus 41 degrees was recorded. During the year 1898 the last killing frost in spring at Blackfoot was on June 5, and the first frost during the succeeding fall was on September 29; at Minidoka the corresponding conditions occurred on May 14 and September 4. The snowfall, while aggregating during certain winters from 30 to 45 inches or more, varies greatly from year to year and from place to place, but seldom remains long on the ground. The sudden snowstorms are usually succeeded quickly by thaws during the hours of sunshine and sleighing is seldom practicable. Warm winds, termed "Chinook winds," frequently occur in winter, during the prevalence of which snow, if present, disappears as if by magic, leaving the plains and the lower slopes of the bordering mountains bare. Large numbers of horses, cattle, and sheep are pastured on the plains throughout the winter and require to be fed only during the more severe storms. In winter the skies, although frequently clouded, are usually clear, especially at night, and the stars are of phenomenal brilliancy.

The prevailing winds, often heavily dust-laden, are from the west, and at many times, especially in the fall, blow with such strength and constancy as to become

trying to a person's nerves. In summer and fall strong afternoon winds frequently occur, which die away at sunset; these are almost invariably from the west. These strong breezes are nearly as regular in their periods as the sea breezes on lands bordering warm seas, but instead of bringing a refreshing coolness they are frequently hot, and to one facing them seem the breath of a furnace. On the broad plains miniature whirlwinds are of frequent occurrence, particularly on hot afternoons, and the dust carried upward by them forms tall columns with hollow centers in which, when they are near the observer, a spiral motion can be discovered. These dust columns are sometimes 2,000 or 3,000 feet high, and are a characteristic feature of the parched desert-like plain when heated by the intense summer sun.

Owing to the great extent of the plains, their variations in altitude, the influence of the adjacent mountains, and other factors, there are many local variations in the climatic conditions. The most marked differences are in temperature and in the length of time the land is snow covered.

These variations are most marked in the broad, nearly flat areas forming the general surface and in the limited tracts of level land in the canyons and canyon-like valleys. In the canyon of Snake River and its tributaries below Shoshone Falls the atmospheric conditions are markedly different from those on the surfaces of the adjacent plains. In the canyons the temperature in summer, owing to the shelter from the winds afforded by the bordering precipices and the reflected and radiated heat from the black rocks, is usually much higher than on the open plains. Cool breezes frequently blow along the river, however, tempering the intense heat. Again, in winter, owing largely to the ameliorating influence of the river, as well as the protection afforded by the bordering cliffs from the freezing blasts that sweep over the plains, the mean daily and monthly temperatures in the canyon are considerably higher than on the neighboring undissected plain. Snow seldom lies on the ground in the canyon bottoms for more than a few days at a time.

The canyons furnish many favorable places for orchards, vineyards, and gardens, not only on account of the intense heat and strong light during the growing season, when they are essentially hothouses, but because water from springs with a temperature of about 60° F. can frequently be had for irrigation.

In brief, the Snake River plains present a typical illustration of an insular or continental climate, such as is characteristic of regions of mild relief, remote from the tempering influences of the ocean, and deprived of their requisite share of moisture by the presence of lofty mountains in the path of the prevailing winds.

One feature of the weather in early fall is the gathering of thunderstorms about the mountains and their advance with fierce lightening and deep-toned thunder over the plains, where they melt away and disappear ineffectually in the drier air. At times these struggles of opposing forces are repeated daily, and a more advanced position is gained each afternoon by the invading storm, until a few pattering raindrops fall, or perchance a brief drenching downpour occurs on the thirsty sagebrush lands. More often, however, the vast banks of brilliantly illuminated cumulus clouds are festooned below with descending rain sheets which fail to reach the earth. Accompanying these inefficient thunder squalls there sometimes comes a heavily dust-laden wind which advances across the land like a wall of blackness, obscuring the landscape, and as it passes the observer producing a twilight even when the sun is high in the heavens. At such times the eyes are blinded and the throat is choked by the all-penetrating dust particles. These dust storms, unaccompanied by rain, explain the origin of the fine yellow soil which covers much of the plains, mantles the sides of isolated volcanic hills, and extends far up the neighboring mountain slopes.

The temperature of the water pouring out of the walls of Snake River Canyon shows that it is not derived from deep fissure springs and, in fact, has not made a deep descent into the earth. The water no doubt comes from the mountains lying north of the Snake River plains and is supplied mainly by the subterranean flow of "lost rivers."

(The geology report on Fort Peck site referred to is as follows:)

#### 1. GEOLOGY

The geology of the Fort Peck area as reported by Mr. H. T. Stearns and Mr. A. M. Piper is believed to be an accurate and adequate description of the general geology of the area, namely, from Milk River to Fort Peck Reservoir and from Larb Creek to Fort Peck Dam site. The report is, however, I feel, inadequate

in specific detail in that it fails to emphasize the geology of the construction site as shown by the engineering firm, namely, ranges 36 and 37 east, township 26 north. In the report generalities have been drawn that may or may not be applicable to the specific area. The following statements as included in the report are in point.

The presence of glacial drift in the area is in general as mapped by Mr. Piper on map 3-A of his report, namely, north of the proposed site and extending across the northern side of the area. Mr. Stearns in his report on page 3, paragraph 4, states:

"A thin veneer of glacial till lies north of the site and locally obscures the Bearpaw shale. It is clay containing pebbles and cobbles of foreign rock transported by glaciers. The thickness of the till is rarely more than 10 feet."

Under III Geology, page 54, of the Smith, Hinchman & Grylls report is found:

"The Fort Peck area is everywhere covered with a gumbo topsoil (weathered Bearpaw shale) 4 to 20 feet deep."

My findings on investigation of the two townships in question were that only a very thin veneer of glacial drift of from a few inches to 2 feet in thickness composed of yellow clay, gravel-sized pebbles, and a few scattered boulders 6 inches to 1½ feet in diameter was present over this area in scattered localities where the Bearpaw shale did not crop out. Glacial drift as much as 15 feet in thickness is present east of Willow Creek in the vicinity of Fort Peck Dam. Presumably based on the above-cited conflicting data, the construction firm of Alvord, Burdick & Howsan in their report under IV E. Construction and operational costs, page 111, state:

"(a) The soil at the Fort Peck site is a glacial drift containing bentonitic clay (gumbo). This soil is not suitable for supporting heavy loads as explained elsewhere in this report, and for that reason excavations for foundations and footings will need to be made to the Bearpaw shale, an average depth of approximately 15 feet."

Continuing in the next paragraph they state:

"A preliminary estimate of the cost of excavation and sealing indicates that it would be approximately \$2 in addition to the normal \$1 per square foot of ground floor area."

#### QUESTIONS

1. How much glacial drift is present at the site where major construction is planned?

2. Assuming the glacial drift is not of an average depth of approximately 15 feet as has been done by Alvord, Burdick & Howsan, what reduction in the cost of excavation, inasmuch as a total of \$3 per square foot of ground floor area is involved, can be made in favor of the Fort Peck site?

Similar discrepancies appear in the report regarding the composition and structure of the Bearpaw shale. The thickness of the Bearpaw shale in this locality is estimated at from 800 to 1,000 feet. The greatest amount of erosion of the upper beds of this shale has no doubt taken place in the valley of the Missouri River. The shale as it was encountered during the construction of Fort Peck Dam in the axis of the Missouri River is described by Mr. Piper. The thin seams of bentonite from a few inches to 1.4 feet encountered at the dam have been discussed in some detail. The elevation of the shale at this site is in the neighborhood of 400 feet lower than it is at the site chosen for construction approximately 25 miles to the west. The fault zones encountered at the dam site have also been mapped and included in the report. From this data the conclusion is drawn that similar conditions would be encountered at the proposed AEC plant site. This is an assumption sufficiently important because of its influence on the construction of foundations that, in my opinion, should not be made without benefit of some exploratory work at the proposed site.

Under III D. Foundation conditions, pages 58 and 59, of the report, following a discussion of the shale at Fort Peck Dam is found the statement, "may be expected to occur" when reference is made to the rest of the area. In my discussions with the Army engineers at Fort Peck I was advised that no serious foundation failures have occurred at the dam and that the steel and concrete power plant requires foundation pressures of 4.4 tons per square foot. The report makes no distinction in the problems that were encountered at Fort Peck that must be considered related only to the construction of a major earth fill dam as distinct from problems that would be encountered in the construction of a plant such as we understand is now under proposal.

On page 10, item 23, of Mr. Stearns' report, a comparison of the surface rocks that would be the foundation material for construction at the two sites is

made. An analysis of the basalt at Pocatello is given in some detail. In comparison in his description of the Bearpaw shales at Fort Peck is found the statement, "No analyses available," following which is cited as conclusions that abundant bentonite is present, also abundant gypsum, in the seams. It is not possible to determine what is meant by abundant and just how thick and of what frequency are the seams.

#### QUESTIONS

1. Do you know that the seams of bentonite and gypsum and the faulting conditions found in the Missouri River Valley at Fort Peck are present at the site chosen for construction of the AEC plant?
2. What is meant by an abundant amount of bentonite and gypsum?

#### II. TOPOGRAPHY AND DRAINAGE

The major part of the two townships chosen as a construction site is best described as tableland, the top of which shows the results of glacial scouring. Well-rounded knolls of bedrock shale with elevations of 30 to 40 feet above the average land surface are the principal relief features. The tableland characteristic is the result of the action of the glacial ice sheet and the large volumes of water released as the ice melted. The broad, flat, scoured-out valleys of Larb, Beaver, Willow, and Lone Tree Creeks are approximately 50 to 150 feet lower in elevation. The location and direction of flow of these creeks, namely Larb Creek on the west flowing north, Lone Tree Creek on the south flowing southeast, Willow Creek on the east flowing northeast, and Beaver Creek on the north flowing southeast, have left the area under discussion as a broad erosional remnant. The tributaries to these creeks have failed to produce any well-defined drainage channels into the tableland due to the low average annual rainfall and the resistance of the Bearpaw shale. Drainage of the proposed site is in all directions with little to no opportunity for the run-off waters to collect in any appreciable quantity until the lower part of Willow Creek is reached. The weathering action of the Bearpaw shales is distinct from that of the soft sandstones and carbonaceous shales of the Lance formation found between Willow Creek and the Fort Peck Reservoir.

In paragraph 4, page 55 of the report, the statement is made that "some terracing has been done on the site to check rapid run-off and to conserve the soil." This statement is incorrect. In the broad alluvial filled valleys under a cooperative agreement between the Soil Conservation Service and the local grazing associations small dikes varying in height from a few inches to about 2 feet were built along the contours to impound the waters released from snow melt in ponds of from 5 to 40 acres. Grass seed was planted in the impounded areas and the small amount of water supported growth of this grass for winter pasture. Such an operation would have been impractical in an area subject to flooding, and the program was not designed to prevent soil erosion.

No stream gaging records are included in the report to support the statement that flash-flooding conditions can be anticipated. A correlation is drawn between streams in the Milk River Valley at some distance from this site. It is not shown that the streams used for comparison purposes drain an area composed primarily of Bearpaw shale or what the elevation of these streams is or the nature of the valleys of these streams.

#### QUESTION

Do you know that floods occur in the creeks that drain the proposed site in the locality of the proposed site?

#### III. WATER SUPPLY

Reference is to III F and paragraph 4 of page 76 of the Smith, Hinchman & Grylls report. The report states:

"The necessary 6,000,000 gallons per day for domestic water supply would be developed by the addition of three wells to the facilities of existing communities. The estimated cost is \$65,000. The addition of an iron removal process to improve water quality would increase the total cost to about \$582,900. An alternate system would use filtered Milk River water at an estimated construction cost of \$825,000. The cost of a distribution system for either proposal is estimated at \$380,000."

It is not apparent why expenditures of these large sums of money are necessary and have been included in the report.

During the construction of Fort Peck Dam the maximum increase at any one time in Valley County of employees, their families, etc., was 50,000 people. The increased demands for water were taken care of by the local communities and by the drilling of a few shallow wells at the sites of the mushroom towns. No charge was made to the Army engineers for any of the increased installations. Neither prior to construction of the dam nor during the construction, nor since construction has been completed has it been found necessary to install iron removing equipment in any of the municipal or local water supplies. The only expense to the Army engineers was the installation of a small filtration plant designed to meet the needs of the Federal employees at the permanent installations at Fort Peck site. It is my belief that the domestic needs for construction of the atomic energy plant at the proposed site can be met in a similar manner. The saving incurred would be the sum total of \$65,000 for wells, \$582,000 for iron removal equipment, and \$380,000 for distribution system, totaling \$1,027,000.

#### QUESTION

Will the requirements for construction of this project as compared to those for construction of Fort Peck Dam be such that the water needs for the construction employees cannot be met in the same way as was done during the construction of the dam?

The water requirements of the plant in the amount of 23,000,000 gallons per year are, according to the report, available from the Fort Peck Reservoir. It is my opinion that the importance of this adequate supply has been underestimated in the report. The availability of the water needs, and more if future requirements demand, in a controlled reservoir appears to have definite advantages when compared with the estimated but inadequately proven supply described at Arco, Idaho, and discussed later in this report.

#### IV. DISPOSAL OF WASTE WATERS

It is not within my experience to know of the requirements relative to the disposal of contaminated water of the type referred to in this report. Factors of a geological and hydrological nature present at both the Fort Peck and Arco sites are, however, believed to be pertinent.

The Bearpaw shale, which is highly impermeable and is known to be present at the Fort Peck site to depths of 800 or more feet, is remarkably uniform in texture. This rock would appear to be an ideal material for the construction of discharge reservoirs with little to no danger in the Fort Peck Reservoir suggests that an available and convenient method for diluting the waste water is present at this site.

The report makes special emphasis of the possibility of a catastrophe. It is not known just what type of a catastrophe is being considered, although Mr. Piper on page 33 of his report emphasized that the location at Fort Peck is understandable inasmuch as it is adjacent to a major river system. It can only be assumed that the reference is to the possibility of contaminated waters getting into the main body of the Missouri and later the Mississippi River. I believe it is important to note that, should contaminated water reach the Fort Peck Reservoir, after dilution at this point it would move down the Missouri Valley through a relatively undeveloped area only to be further diluted and impounded in the much larger body of water that will be held back on completion of the Garrison Dam, and that following release at Garrison Dam its path would be through an undeveloped region until it reached the large reservoir that will be impounded behind Ford Randall Dam, which is also now under construction. Over this entire distance of flow it will have passed only one town of any size—namely, Bismarck, N. Dak., whose population is approximately 18,000. It is difficult under these circumstances to see why reference was made to the possible contamination of the lower Missouri River Valley and Mississippi River Valley.

#### QUESTIONS

1. Do you feel that the possibility of a catastrophe which would endanger large areas in the Missouri and Mississippi River Valleys warrants abandonment of the Fort Peck site?

2. Is the catastrophe under consideration similarly dangerous to the Arco site?

(The geology report on the Pocatello site is as follows:)

#### I. GEOLOGY

The geology of this site was described in the Smith, Hinchman & Grylls report and the reference included in this report—namely, United States Geological Survey Water Supply Paper 774—has been reviewed.

The lava beds, according to the report, are reportedly of a thickness "at least 1,000 feet." These beds are described in the report as follows: "The surface of the lava, which is very permeable, clinkery, spiny basalt with deflated vesicles \* \* \*" and, later on, as "vesicles formed by the expansion of gases as the lava cooled as well as tunnels and caves, open spaces, at contacts, shrinkage cracks, tree molds, and porous clinkery rock. \* \* \*"

Continuing the description, "Little information is available regarding the composition of the overburden. Logs of the well drilled in the Naval Proving Ground are presented as a part of the report of Mr. Harold T. Stearns. \* \* \*" Quoting further from the report, on page 66 the engineers recommend as follows: "However, to safeguard against the possibility of subsequent failure because of large cavities characteristic of this formation, a number of test borings should be made within the area to be occupied by the structure. Load tests are recommended where foundations are to be erected on the gravel and clay beds."

Inasmuch as the sand, gravel, and clay beds are outwashes built up on the surface of previously deposited lava beds, it is apparent that the cavernous nature of the lava beds can also be wash deposits. Based on the geology as described in the report and in part quoted herein, the conclusion of the engineer as stated on page 67 is: "The basalt lava at Pocatello offers excellent material on which to build heavy structures." The surface of the lava flows is described as windblown material, variable in thickness, with considerable increased thicknesses found in depressions. No cost estimates are available to cover the cost of doing the recommended boring for foundation formations nor in any estimate made as to the cost of removing the windblown and outwash material that reportedly cover the lava flows.

#### QUESTIONS

1. Do you know that the site chosen is free of caverns and tunnels and is suitable for heavy construction requiring foundation supports of 8,000 pounds or more?

2. Do you anticipate at this location that some cost will be involved in removing the windblown and outwash material to permit construction on solid basalt?

3. Assuming that borings as recommended encounter tunnels and caves, what adjustments would be necessary at the Pocatello site?

The report describes lava flows in the vicinity of Craters of the Moon National Monument as having occurred in very recent geological times. This igneous activity is described as having taken place approximately 1,000 years ago. No evidence is given to indicate that a repetition of this relatively recent, geologically speaking, igneous activity cannot be expected to reoccur.

#### QUESTIONS

1. Do you believe that this is an area of relatively recent igneous activity?

2. Is there any assurance that this igneous activity is not at present only in a state of resting and will not again become active?

#### II. WATER SUPPLY

The report describes two potential water supplies to meet the needs of the proposed plant.

After suggesting that water can be taken directly from the Snake River at a cost not competitive to the ground-water supply (and also far more expensive than the supply at Fort Peck), it practically eliminates this source by stating that the water in this area is at present committed to purposes of irrigation. The water supply to be considered, therefore, is to be taken from the underground waters found in the lava beds. A description of this potential water supply at the proposed site is given on page 3 of Mr. Stearns' report, "An insufficient number of wells exist in the area to prepare a water-table map. At Cerro Grande, 6 miles due south, the water table has an altitude of 4,430 feet. Other wells at Midway and at Tabor, to the southeast, indicate that contours of the water table slope to the southward and at Midway southwestward at the rate of about

5 feet per mile." Continuing in the next paragraph he states, "Such data as exist indicate that the underflow of Little Lost River, Birch Creek, and some of that of the Mud Lake Basin is moving southward under the site." The water-table contours as drawn on plate 19 of Water Supply Paper 774 of the United States Geological Survey and referred to in the report have not been drawn in the area of the proposed site.

The quantity of water moving underground in the area of the proposed well field is based on a rate of flow of one-half mile per year. This is the rate of flow computed for an area 72 miles northeast of the proposed site: Namely, from Egin bench to Mud Lake. As a basis for determining the specific yield of wells constructed in the proposed field, the results of pumping tests on Navy wells Nos. 1 and 2 are cited on page 9. Well No. 1 was pumped for 18 minutes at a rate of 590 gallons per minute. It has been my experience that a pump test of 18 minutes' duration is not a reliable test and that this is particularly true in aquifers that are cavernous. The large volumes of water adjacent the well are not necessarily removed to create a true cone of depression necessary to compute safe recharge. This is emphasized by the data given for the test on Navy well No. 2 located in the immediate vicinity of the No. 1 well. After 65 minutes of pumping at a rate of 150 gallons per minute, a specific yield of 15 gallons per minute was computed, considerably lower than that computed for well No. 1. Mr. Stearns has seen fit to point out that on an earlier pump test at a rate of 470 gallons per minute made by the driller the reported specific yield was  $11\frac{1}{2}$  gallons per minute or a decrease of 23.3 percent, and the time interval for the driller's test is also an unknown factor.

The logs of Navy wells Nos. 1 and 2 are cited to describe the nature of the rock formations that can be anticipated in the area of the proposed well field which is to supply this plant. The log of well No. 2 is as follows:

Two feet of soil, 8 to 15 feet of stream-laid gravel and sand, 2 to 10 feet of clay, 36 feet of basalt, 18 feet of clay, 67 feet lava, 4 feet of clay, sand, and gravel, 53 feet lava, 4 feet clay, 152 feet lava, 4 feet of clay, 41 feet of lava, 3 feet of clay, 97 feet of lava, 4 feet of sand, 140 feet of cinders and lava, 23 feet of clay, sand, and gravel, and 21 plus feet of lava. In 690 feet of lava no less than 7 interbedded impermeable clays are described. There is no evidence that similar clay beds are found in the Egin bench to Mud Lake area where the figure of one-half foot per mile for underground flow was computed.

Assuming that the direction of flow from the north and east into the well field is as described, there is apparently some question as to the underground geology at the south end of the proposed well field and as to how much recharge can be expected from the discharge of Big Lost River. Mr. Stearns points out on page 7 that much of the water from Big Lost River appears to move southward toward Snake River, a little west of the site, and that the Twin Buttes and Big Butte may be projections of a buried ridge of poorly permeable rock that separates the ground water under the site from that under the main part of the plain south of the line of these buttes or that the buried ridge may have been cut by a pre-basalt canyon, in which case the ground water south of the buttes could be made to move northward if the water table were lowered sufficiently by pumping under the site to cause the hydraulic gradient to slope northward.

#### QUESTION

Is the information available to permit making a definite statement as to the quantity of water moving into the proposed well field, the rate of this underground flow, and the specific yield that can be anticipated from wells intercepting this underground flow at the proposed Arco site?

#### III. DISPOSAL OF WASTE WATER

A very inconclusive and poorly described method for disposal of the contaminated and noncontaminated water at this site is suggested in the report.

The disposal of the waste waters as described in Mr. Stearns' report (p. 12) is as follows: "Uncontaminated waste fluids can be dumped into the lava beds, where they will slowly percolate to the basal water table and find their way to the Snake River Springs. The rate of movement of the ground water is of the order of one-half mile per year based upon the time it took the Egin bench water to reach Mud Lake." On page 8 of the Consultant's Preliminary Report (continued) under item K, Disposal of waste waters, is found, "Waters could be evaporated in the 'sinks' or sink into the basalts southwest of the site."

No mention is made as to the special handling that might be required of contaminated waste waters. If discharge is to be into the "sinks" located just

north of the proposed well field, this water can be expected to return to the well field in accordance with the gradient of the water table as contoured on plate 19 of United States Geological Survey Water Supply Paper 774. The rate of this return is unknown. It can be expected that it would be influenced by the numerous impermeable clay beds as described in the logs of the Navy wells. It is also to be expected that the rate of return would be considerably influenced by the increased draw-down resulting from heavy pumping of the proposed well field.

If the contaminated waters are to be discharged south or southwest of the well field, contamination of the well field is likewise a possibility. Mr. Stearns points out the possibility of water reaching the well field from the main lava field due to draw-downs as cited earlier in this report. The rate of underground movement of the waste water is not given for the well-field area. It appears that something less than a scientific approach to the problem has been presented for an area composed of lava beds estimated to be from a few hundred feet to a thousand or more feet in thickness where tunnels and caverns are characteristic, some of which are as large as 50 feet in diameter, and where numerous impermeable beds of clay are known to be present both near the surface and at depths of 600 feet or more and where the computed transmissibility must be considered as relative.

In addition to the increased gradient toward the well field produced by lowering of the water table by pumping, consideration must also be given to the increase in gradient of the water table at whatever site is chosen for discharging the 23,000,000 gallons of waste water. No safe distance for discharging the contaminated waters is given in the report. Any increase in distance from the site down gradient as measured on the at present unknown gradient of the ground-water table means a decrease in the distance to the ultimate point of discharge, namely, the American Falls Reservoir and the Snake River.

#### QUESTIONS

1. Has a definite location for the discharge of contaminated and noncontaminated waste waters been described in this report?

2. Would discharging contaminated waters in the lower Big Lost River channel and the "sinks" be dangerous to the water supply in the present-described well field?

3. Is it known at what distance from the present well field contaminated waters can be discharged in the main lava bed south or southwest of the present well field?

4. Would discharging contaminated water down gradient as measured on the ground-water table decrease the time interval when such water would be discharged into the American Falls Reservoir or the Snake River?

5. Is the rate on which these contaminated waters would move from any site down gradient into the American Falls Reservoir and the Snake River known to you?

6. Is there danger of contaminating wells in the area north of the American Falls Reservoir before such contaminated waters reach the reservoir or the Snake River?

The report makes no mention of a possible catastrophe that may create serious damage due to the release of contaminated water in the area downstream in the Snake and Columbia River Valleys. Since I have no information as to exactly what is meant in this report by catastrophe, it is not possible to make specific deductions. It is, I believe, worthy of note to point out that the ground waters of the Snake River lava beds are discharged into the main channel of the Snake River and thus become part of that stream's flow.

The CHAIRMAN. Now, gentlemen, we will have to recess because I have to get to the floor.

Senator Hickenlooper had to go and the Members of the House will have to leave.

The Chair will announce future proceedings.

Senator Ecxon. Before you leave I just want to again express my very deep appreciation to you and the members of this committee for listening to this testimony. I appreciate it very much.

(Whereupon, at 5:20 p. m., the committee recessed, subject to the call of the chair.)

## APPENDIX

### UNCLASSIFIED PORTION OF THE ATOMIC ENERGY COMMISSION CONTRACT MANUAL

Bulletin  
GM-No.

Procurement and Contracts  
Contract Manual

Issuance Date:

#### CONTRACT MANUAL FOR ENGINEERING AND CONSTRUCTION SERVICES— CONTRACT BOARDS

For: Managers of Operations.

1. *Purpose.*—The purpose of this Bulletin is to make effective the attached contract manual and to provide for the establishment of Contract Boards in the several Offices of Operations.

2. *Contract Manual.*—The contract manual provides the policies, practices, and procedures to be followed by the Commission and its field offices in contracting for construction and associated architectural-engineering services. To the extent and subject to the limitations of practicality provided in the Manual, these practices and procedures (unless in conflict with the provisions of existing contracts) are to be applicable to the Commission's cost-type contractors and the subcontractors. With respect to these services the manual also establishes certain operating relationships between the appropriate Division Directors and the Offices of Operations. As additional sections and parts are completed or revisions or changes appear necessary, they will be issued by the Director of the Division of Production after appropriate clearance with other Divisions and Offices. The portions of the manual issued herewith have been prepared on the basis that the reimbursable costs and liability provisions of contracts entered into by the Commission and its contractors for engineering and construction work will be substantially similar in those respects to the Army forms of contracts. Suggestions as to improvement of the content of the manual and requests for clarification of its provisions should be addressed to the Division of Production.

3. *Contract Board.*—For the performance of the functions of selection of contractors and contract negotiation (as described in this paragraph 3), each Manager of Operations shall establish a Contract Board in order to assure the use of combined judgment and the preparation of adequate records on these important matters. The Contract Board, for each selection or negotiation, should consist of three members (or more, if desirable) of the Office of Operation's staff designated by the Manager. He should also designate the Chairman and Secretary of the Board. The members of the Board, whether permanent or not, should be individuals of recognized ability, whose collective experience includes engineering, construction, and general contract administration. In each instance of Board action on selection or negotiation, the Board should be the means of bringing to bear the necessary judgments of those members of the Operation's staff having concern with the matter. These staff members may include those concerned with Community Affairs, Finance, Legal, Personnel, Production, Research, and Security as well as representatives of the prime cost-type operating contractor. To assure continuity and uniformity in procedure, it is desirable that at least one member of the Board be a key member of the Manager's staff and carry through its varied activities on a relatively permanent basis. For contracts having an estimated construction cost of less than \$500,000, a panel of one or more members may act for the Board, subject to its review.

(a) With respect to prime contracts for engineering or construction services, the Board shall assist the Manager, as directed by him, in the following:

(1) the recommendation to the Manager of Construction Contractors and Engineer-Constructors to be selected to perform work on a cost-plus-a-fixed-fee

basis, and Architect-Engineers to be selected to perform work on a lump sum or cost-plus-a-fixed-fee basis.

(2) the negotiation of fees to be paid on cost-plus-a-fixed-fee contracts, and the amounts to be paid Architect-Engineers.

(3) the negotiation of other substantive provisions of contracts for architect-engineer services and for construction services on a cost-plus-a-fixed-fee basis.

(4) the negotiation of adjustments in fees or in contract prices because of changes in the scope of the work to be performed under architect-engineer and cost-plus-a-fixed-fee construction contracts.

(5) the performance of such other functions as are provided in the contract manual or are assigned to the Board by the Manager of Operations. Assigned functions might include advice to the Manager on recommendations to reject all bids, award of contracts to other than the low bidder as to price, and other difficult contract problems.

(b) With respect to *subcontracts*, the Manager of Operations will determine the most appropriate manner for the Contract Board to operate in accordance with the provisions of the contract concerned.

4. *Confidential Nature of Part 4, Section IV of Manual.*—Part 4, Section IV and Exhibits II-A, II-B, and III of the contract manual contain information, particularly with respect to negotiation of fees, of a confidential character which makes it incumbent upon those having access to this Part and Exhibits to see that only those employees of the Commission requiring such information in performance of their duties shall receive it.

5. *Offices of Operations.*—Offices of Operations as used in this Bulletin and in the manual includes the Schenectady Operations Office.

6. *Effective Date.*—The provisions of this Bulletin shall become effective not later than thirty days from the date of its issuance. Each Manager of Operations, at his option, may make its provisions effective prior to that date.

7. *Prior Bulletins.*—Any Bulletins, Instructions or other memoranda which provide practices or procedures inconsistent with this Bulletin and the attached manual are superseded.

8. *Administration.*—Responsibility is vested in the Manager of Operations for effective utilization of the contract manual and for the establishment and functioning of the Contract Board. Staff assistance will be provided by the Director of the Division of Production.

CARROLL L. WILSON, *General Manager.*

## CONTRACT MANUAL

### TABLE OF SECTIONS AND PARTS

#### SECTION I. GENERAL PROVISIONS

Part 1. Introduction.

Part 2. Authority to Make Engineering and Construction Contracts.

Part 3. Basic Policies in Contracting for Engineering and Construction Services.

#### SECTION II. FORMAL ADVERTISING FOR CONSTRUCTION SERVICES

Part 1. Use of Formal Advertising.

Part 2. Solicitation of Bids.

Part 3. Submission of Bids.

Part 4. Opening of Bids and Award of Contract.

#### SECTION III. CONTRACTS FOR ENGINEERING AND CONSTRUCTION SERVICES WITHOUT FORMAL ADVERTISING

Part 1. Permissible Use.

Part 2. Award of Construction Contracts Without Formal Advertising.

Part 3. Lump Sum Architect-Engineer Contracts.

#### SECTION IV. COST-PLUS-A-FIXED-FEE CONTRACTS

Part 1. Use of Cost-Plus-A-Fixed-Fee Contracts.

Part 2. Selection of Architect-Engineers and Construction Contractors.

Part 3. Engineering and Construction Information Required in Negotiating contracts.

Part 4. Fees on Cost-Plus-A-Fixed-Fee Contracts.

- Part 5. Salaries and Wages Under Cost-Plus-A-Fixed-Fee Contracts.
- Part 6. Allowances for Work in the Main or General Office.
- Part 7. Procedure in Negotiating Cost-Plus-A-Fixed-Fee Contracts.
- Exhibits I. Record for Proposed Award of Contract.
  - IIA. Schedules of Fees for Various Types of Services.
  - IIB. Fixed Fee Schedule for Procurement of Equipment.
  - III. Examples of Fee Computations.
- Appendix I. GM Bulletin No. 125 (Transmittal).
  - GM Bulletin No. 44.
  - GM Bulletin No. 58.

  - 1-32.3 Improper Combination of Contracts.
  - 1-32.4 Prohibited Contracts.

## SECTION I. GENERAL PROVISIONS

## PART 1. INTRODUCTION

1-10 *Applicability.* For the Commission and its field offices, this contract manual:

- (a) describes the policies to be followed in contracting for construction and architect-engineer services;
- (b) sets forth practices and procedures which should be followed in such contracting; and
- (c) prescribes the method for determination of fees to be paid on lump-sum architect-engineer contracts and on cost-plus-a-fixed-fee construction and architect-engineer contracts.

To the extent and subject to limitations of practicality provided in the manual these policies, practices, and procedures (unless in conflict with the provisions of existing contracts) are to be applicable to the Commission's cost-type contractors and subcontractors. The effective date of the manual is provided in the transmittal Bulletin, a copy of which is included in Appendix I.

1-11 *Supplements and Amendments.* As additional sections or parts of this manual are completed, or revisions or changes appear necessary, they will be issued by the Director of the Division of Production after appropriate clearance with other Divisions and Offices. The Managers of Operations may prescribe supplementary and implementing procedures which are consistent with the provisions of this manual. A copy of any written procedures will be forwarded to the Director of the Division of Production.

1-12 *Deviations From Manual.* No substantial or major deviation may be made without the prior approval of the appropriate Division Director (see paragraph 1-22).

1-13 *Definitions.*

1-13.1 *Prime Contracts.* The term "prime contracts" refers to contracts in which the United States of America, through the Commission, is a party.

1-13.2 *Prime Cost-Type Operating Contracts.* The term "prime cost-type operating contracts" refers to prime contracts for the establishment and operation of Commission facilities and under which the contractor is reimbursed his allowable costs as defined in the contract.

1-13.3 *Subcontracts.* The term "subcontracts" as used in this manual refers to contracts for engineering or construction work made by a prime contractor or by any contractor in a contractual chain wherein all the preceding contracts are on a cost basis.

1-13.4 *Construction.* The term "construction" refers to the erection or installation of any building, structure, plant, ground facility or other real property and material alterations or improvements thereto, regardless of purpose.

1-13.5 *Commission's Representative.* The term "Commission's representative" refers to the Manager of Operations or his duly authorized representative.

1-13.6 *Office of the General Counsel.* The term "Office of the General Counsel" refers to the counsel in the field or his designated representative.

1-13.7 *Director of Finance.* The term "Director of Finance" refers to the staff member having responsibility for accounting, auditing, and related matters in each Office of Operations.

1-13.8 *Other Definitions.* Other necessary definitions are contained in the appropriate portions of this manual.

#### PART 2. AUTHORITY TO MAKE ENGINEERING AND CONSTRUCTION CONTRACTS

1-21 *Commission's Authority.* The Commission's contract authority is set forth in the Atomic Energy Act of 1946, 60 Stat. 755 (42 U. S. C. secs. 1801, *et seq.*).

1-22 *Delegated Authority.* By GM Bulletin to each Office of Operations, and subject to the limitations contained in the Bulletin, the Managers of Operations have been given authority to negotiate and enter into contracts which are in accordance with approved programs and policies. Some of the limitations on this authority are—

(a) the approval of the appropriate Division Director<sup>1</sup> is required of purchases, contracts, extensions or modifications in excess of the amount set forth in the Bulletin;

(b) the Manager of Operations is required to bring to the attention of the appropriate Division Director all new or unusual types of contractual transactions;

(c) restriction of the authority to redelegate, and

(d) further stipulations imposed from time to time by the appropriate Division Director.

1-23 *Division Director's Approval.* Proposed contracts and subcontracts (and amendments) for engineering or construction services which are not within the authority of the Manager of Operations under the applicable Bulletins must be submitted with the information set forth in Exhibit I, attached, to the appropriate Division Director,

(a) for clearance before award and execution or approval of the contract by the Manager of Operations,

(b) after execution or approval by the Manager of Operations, for formal approval of the contract by the appropriate Division Director. The approval of the Division Director is also required in certain other instances as provided in other Sections and Parts of this manual.

<sup>1</sup> Division of Production for Raw Materials Operations Office, the New York Operations Office, the Oak Ridge Operations Office, and the Hanford Operations Office, including Schenectady Operations Office, Division of Military Application for Santa Fe Operations Office, and Director of Reactor Development for Chicago Operations Office.

## PART 3. BASIC POLICIES IN CONTRACTING FOR ENGINEERING AND CONSTRUCTION SERVICES

1-30 *Definitions.* The term "formal advertising" refers to that method of contracting for construction services provided in Section II. The term "invited bids" refers to solicitation of competitive bids from selected contractors qualified to perform the work and award of the contract as provided in Section III. The term "negotiation" refers to any method of contracting except by formal advertising or by invited bids.

1-31 *Statutory Provisions.*

1-31.1 *Section 3709 R. S.* In general, prime contracts are subject to and should be made in compliance with the provisions of Section 3709 of the Revised Statutes (41 U. S. C. sec. 5).

1-31.2 *Atomic Energy Act of 1946.* The Atomic Energy Act of 1946 provides that certain contracts may be entered into without regard to the provisions of Section 3709 of the Revised Statutes.

1-31.3 *Application.* The application of these statutory provisions to contracts for engineering and construction services is set forth in Part 1 of Section III.

1-32 *Methods of Contracting.* It is the policy of the Commission that—

(a) To the fullest extent feasible, construction contracts should be made on a lump sum or unit price basis using the formal advertising procedures provided in Section II.

(b) Where the procedure provided in Section II cannot be used, nevertheless there shall be obtained as full and free competition as is feasible in obtaining required engineering and construction services.

(c) A fair proportion of the total amount of contracts should be placed with small business concerns.

1-32.1 *Engineering Services.* Contracts for engineering services will be made on a lump sum basis in the manner provided in Section III, or if that is not feasible, on cost-plus-a-fixed-fee basis as provided in Section IV.

1-32.2 *Construction Services.* Construction contracts will be let by formal advertising as provided in Section II, or if that is not feasible, by invited bids as provided in Section III, or by negotiation. Construction contracts let by formal advertising or by invited bids will be let on only a lump sum or unit price basis. Construction contracts let on a negotiated basis may be lump sum, unit price, or cost-plus-a-fixed-fee type of contract.

1-32.3 *Improper Combination of Contracts.* A combination of a cost-plus-a-fixed-fee contract and a lump sum (or unit price) contract for engineering or construction services will not be awarded to the same contractor if performance of any portion of the work under each contract is to be concurrent and in the same general location. A lump sum or unit price contract or contracts shall not be let to the same firm for both engineering and construction services where the services are furnished for the same construction job.

1-32.4 *Prohibited Contracts.* Contracts may not be awarded to persons or firms who are disqualified by reason of failure to comply with the provisions of the Davis-Bacon Act (40 U. S. C. 276a to 276a-5), as provided in GM Bulletin No. 58. The cost-plus-a-percentage-of-cost type of contract will not be used.

## SECTION II. FORMAL ADVERTISING FOR CONSTRUCTION SERVICES

#### PART 3. SUBMISSION OF BIDS

- 2-31 Method of Submission.
- 2-32 Time of Submission.
- 2-33 Modification or Withdrawal of Bids.

#### PART 4. OPENING OF BIDS AND AWARD OF CONTRACT

- 2-40 Scope of Part.
- 2-41 Opening of Bids.
- 2-42 Recording of Bids.
- 2-43 Rejection of Bids.
- 2-44 Minor Informalities or Irregularities in Bids.
- 2-45 Mistakes in Bids.
  - 2-45.1 Obvious or Apparent Mistakes.
  - 2-45.2 Other Mistakes.
  - 2-45.3 Mistake after Award.
- 2-46 Award.
  - 2-46.1 Statement and Certificate of Award.
- 2-47 Information to Bidders.

### SECTION II. FORMAL ADVERTISING FOR CONSTRUCTION SERVICES

2-40 *Scope of Section.* This Section sets forth (a) the basic requirements for obtaining construction services by means of formal advertising, (b) the information to be contained in forms used for the solicitation of bids, (c) methods of soliciting bids, (d) policies with respect to the submission of bids, (e) requirements for opening of bids and evaluation of bids and for the awarding of contracts.

#### PART 1. USE OF FORMAL ADVERTISING

2-10 *Meaning of Formal Advertising.* As used in this manual, formal advertising means that method of procuring construction services by competitive bids and awards prescribed in this Section II.

2-11 *Use of Formal Advertising.* In accordance with the basic policies set forth in Part 3 of Section I, construction work shall be generally let by formal advertising. Bids shall be solicited in the manner provided in paragraph 2-21 from all those qualified contractors judged necessary by the Commission's representative, to assure full and free competition consistent with obtaining the required construction services. Subcontracts may be let without compliance with the formal advertising provisions of this Section II. However, in general, these procedures represent good business practice in the expenditure of Government funds. Consequently, insofar as practicable, procedures similar to those applicable to prime contracts should be used in letting subcontracts.

2-12 *General Requirements for Formal Advertising.* No contract shall be entered into as a result of formal advertising unless and until all of the following requirements have been satisfied.

(a) Compliance with the requirements of Part 2 of this Section II for soliciting bids.

(b) Compliance with the requirements of Part 3 of this Section II for submitting bids.

(c) Compliance with all applicable requirements of law, of this contract manual, and of procedures prescribed by each Manager of Operations.

(d) Award has been made to that responsible bidder whose bid, conforming to the invitation for bids, will be most advantageous to the Government price and other factors considered, as provided in Part 4 of this Section II.

#### PART 2. SOLICITATION OF BIDS

2-20 *Preparation of Forms.* The form or forms to be used in the solicitation of bids should contain substantially the following information:

(a) Invitation for Bids:

- (i) An invitation number to be placed in upper right-hand corner.
- (ii) Date of issuance.
- (iii) Name and address of office to which bids will be sent.
- (iv) Date, hour, and place of opening.
- (v) Any requirements as to furnishing of bid bonds and performance and payment bonds.

(b) **Bid Blanks:** Bid blanks are to be filled in by the bidder, and each bid is to be executed in accordance with instructions to bidders.

(c) **Drawings, specifications and other information:** The drawings and specifications, forms of contracts, time for commencement of work and its completion, and other data necessary for the bidder's information, or required by law, should be furnished interested bidders. Each document or attachment must be clearly identified by date, number, etc.

(d) **Other information** as is considered necessary by the Office of Operations.

**2-21 *Methods of Soliciting Bids.*** Bids should be solicited by the methods prescribed in paragraphs 2-21.1 and 2-21.2 and by any other of the following methods as are deemed necessary by the Manager of Operations or his representative in order to assure full and free competition, provided that bids shall be solicited sufficiently in advance of the opening of bids to allow bidders an adequate opportunity to prepare and submit their bids.

**2-21.1 *Mailing or Delivering to Prospective Bidders.*** The form to be used in the solicitation of bids shall be filled out and mailed (or delivered) to each prospective bidder. Each Office of Operations should maintain current lists of construction contractors, classified by type of work they are qualified to perform, such as general construction, heating and plumbing, electrical work, etc. The list should afford as broad a coverage of contractors as is reasonably possible and every effort should be made to include small business concerns on these lists.

**2-21.2 *Displaying in Public Place.*** Copies of the form to be used in the solicitation of bids shall be filled out and displayed at some appropriate public place.

**2-21.3 *Publishing in Trade Journals.*** A brief announcement of construction work proposed to be let may be made available for free publication to trade journals or other publications which inform contractors of proposed construction work.

**2-21.4 *Publishing in Newspapers.*** The essential details of any construction work proposed to be let may be made available to newspapers for free publication. Paid advertisements in newspapers shall generally not be used; but when it is necessary in order to secure effective competition, a brief announcement of the proposed construction work may be inserted in newspapers as paid advertisements, subject to the following conditions:

(a) written authority for such publication has been obtained from the Manager of Operations;

(b) all requirements of law set forth in 44 U. S. Code 321-324 have been met; and

(c) the advertisement shall be prepared in accordance with General Regulations No. 109, issued December 20, 1946, by the General Accounting Office (26 Comp. Gen. 986).

**2-22 *Addenda.*** Changes, including additions, modifications and omissions, in the information supplied prospective bidders and interpretations and explanation of this information shall be issued in the form of addenda or bulletins to all prospective bidders.

**2-23 *Office of Permanent Record.*** Each Office of Operations is the office of permanent record for every invitation for bids issued and distributed by it and for every abstract or record of bids. The file of the invitation for bids should show the distribution which was made and the date thereof.

### PART 3. SUBMISSION OF BIDS

**2-31 *Method of Submission.*** Bids shall be filled out, executed, and submitted by each bidder in accordance with the instructions accompanying the appropriate bid form. Neither telegraphic nor alternative bids shall be considered unless authorized by the invitation for bids or its accompanying papers.

**2-32 *Time of Submission.*** Bids shall be submitted in sufficient time to reach the designated office prior to the time fixed for opening. Bids received after the time fixed for opening are late bids; and the exact date and hour of mailing such bids, as shown by the cancellation stamp or by the stamp of an approved metering device, shall be recorded. Late bids shall be considered, provided they are received before the award has been made, and provided the failure to arrive on time was due solely to a delay in the mails for which the bidder was not responsible; otherwise, late bids shall not be considered but shall be held unopened until the time of award and then returned to the bidder unless other disposition is requested or agreed to by the bidder.

**2-33 *Modification or Withdrawal of Bids.*** Bids may be modified or withdrawn, at any time prior to the time fixed for opening thereof, by written or telegraphic notice received prior to the time fixed for opening. After the opening of bids, no bid may be modified (except as provided in paragraphs 2-44 and 2-45) or withdrawn unless such modification or withdrawal is received before the award has been made and either (a) failure of the modification or withdrawal to arrive prior to the time fixed for opening was due solely to a delay in the mails for which the bidder was not responsible or (b) modification is in the interest of the Government and not prejudicial to the other bidders.

#### PART 4. OPENING OF BIDS AND AWARD OF CONTRACT

**2-40 *Scope of Part.*** This part deals with (a) the opening and recording of bids, (b) the rejection of bids, (c) informalities, irregularities, and mistakes in bids, and (d) the evaluation of bids and the awarding of contracts.

**2-41 *Opening of Bids.*** All bids received prior to the time of opening will be kept secure and unopened until the time of opening (except that an unidentified bid may be opened solely for purposes of identification, provided that such bid shall be resealed immediately and that no information obtained therefrom shall be disclosed) whereupon they shall be publicly opened and read aloud by the official designated to open the bids. Although it is the primary responsibility of bidders to prepare their bids correctly and completely, nevertheless, it is the duty of the Commission's representative, after the opening of bids and prior to award, to examine all bids for minor informalities or irregularities and for obvious or apparent mistakes (as referred to in paragraphs 2-44 and 2-45.1 respectively). The original bids shall not be allowed to pass out of the hands of a representative of the Commission, except when a duplicate bid cannot be made available for public inspection, and then only under the immediate supervision of a representative of the Commissioner and under conditions which preclude the possibility of a substitution, addition, deletion, or alteration in the bid.

**2-42 *Recording of Bids.*** The names of the bidders and the prices bid shall be entered in an abstract or record which shall be available for public inspection.

**2-43 *Rejection of Bids.*** Any bid which does not conform to the essential requirements of the invitation for bids shall be rejected, *provided* that any such bid may be considered when in the interest of the Government and not prejudicial to other bidders. All bids may be rejected by the Commission's representative (a) when rejection is in the interest of the Government or (b) when he finds in writing that the bids are not reasonable, or were not independently arrived at in open competition, or are collusive, or were submitted in bad faith. The originals of all rejected bids, and any written findings with respect to rejection, shall be preserved with the papers relating to the proposed work and they shall be kept available for inspection by duly authorized representatives of the General Accounting Office. Reports of possible violation of any Federal criminal statutes relating to procurement shall be made through the Office of the General Counsel.

**2-44 *Minor Informalities or Irregularities in Bids.*** Bidders shall be given an opportunity to correct minor informalities or irregularities in bids or in the alternative, when it is not to the disadvantage of the Government, the Commission's representative may waive the same if time does not permit correction. Illustrative examples of minor informalities or irregularities are inadvertent failure to furnish bid bond with bid and failure to affix corporate seal.

#### **2-45 *Mistakes in Bids.***

**2-45.1 *Obvious or Apparent Mistakes of a Clerical Nature.*** Any clerical mistake obvious or apparent on the face of the bid may be corrected by the Commission's representative at the time of the opening of bids, if practicable, and in any event prior to award, provided there has been received from the bidder, in response to a request or verification of the bid, a statement as to any such mistake therein. An example illustrative of such mistake is an obvious error in placing a decimal point.

**2-45.2 *Other Mistakes.*** In the case of any suspected or alleged mistake in a bid, other than an obvious or apparent clerical mistake on the face of the bid, the procedure should be as follows:

(a) There should be obtained from the bidder, prior to award, either a verification of the bid or evidence in support of the mistake. If the bidder fails or refuses to furnish evidence in support of the mistake, the bid should be considered in the form submitted.

(b) If evidence in support of the mistake is furnished prior to award, the case should be referred to the Director of Finance who will consult with the Office of the General Counsel on the advisability of presentation to the General Accounting Office. If award of the contract must be made prior to a decision as to the relief, if any, to be given to the bidder alleging the mistake and if there is no room for doubt as to the price or other terms intended in the bid in which a mistake occurred, then:

(i) in the case of a mistake in the lowest bid which as clearly intended would not be the lowest bid, such bid may be disregarded.

(ii) in the case of a mistake in the lowest bid which as clearly intended would still be the lowest bid, award shall be made on the basis of such low bid as originally submitted, but subject to correction if properly authorized, or

(iii) In the case of a mistake in any bid other than the lowest bid, such bid shall be considered on the basis of its price or other terms as clearly intended.

(c) Whenever a mistake in a bid is to be processed in accordance with the procedure set forth in subparagraph (b) above, the following papers should accompany a copy of the bid which contains the suspected or alleged mistake:

(i) A copy of the invitation for bids;

(ii) An abstract or record of bids received;

(iii) A statement from the bidder, and any additional supporting evidence such as work sheets or other data used in preparing the bid, setting forth the complete facts on which the allegation of mistake is based and requesting such definite relief as withdrawal of the bid, change in bid price, etc.; and

(iv) A statement from the Commission's representative showing the date when notice of the alleged mistake was received, and any additional information he may have as to the alleged mistake, together with his recommendations.

(d) Mistakes in bids submitted on subcontracts will not be referred to the General Accounting Office but should be handled by a procedure acceptable to the managers of Operations and the prime contractor.

**2-45.3 Mistake After Award.** When an alleged mistake in a bid is disclosed after award has been made, the case shall be referred to the Office of the General Counsel.

**2-46 Award.** Award shall be made with reasonable promptness by written notice to that responsible bidder whose bid, conforming to the invitation for bids, will be most advantageous to the Government price, previous estimates, and other factors considered, provided that an award shall not be made to other than the lowest bidder as to price except with the written approval of the Manager of Operations or, if he authorizes, the written approval of the Contract Board. A responsible bidder is a bidder who possesses the financial, technical, and management abilities necessary to perform the contract. Among other factors besides price that may be considered in making an award are:

(a) judgment, skill and integrity of a bidder;

(b) reputation and experience of the bidder, and prior work of a similar nature done by him;

(c) changes made or requested in any of the provisions of the solicitation to the extent that such changes do not constitute grounds for rejection under the provisions of paragraph 2-43;

(d) restrictions or conditions imposed in the bid; and

(e) time of performance, provided that the forms soliciting bids made time a material factor.

**2-46.1 Statement and Certificate of Award.** In connection with every prime construction contract let by formal advertising, the Commission's representative shall prepare and execute a statement and certificate of award on U. S. Standard Form 1036, which shall be attached to the original documents and paper constituting the contract which are forwarded to the General Accounting Office. Such certificate shall either—

(a) state that the accepted bid was the lowest bid received in which case neither the rejected bids nor an abstract of the bids need be furnished to the General Accounting Office with the contract; or

(b) list all lower bids than the one accepted together with a detailed statement giving in full the reasons for the acceptance thereof.

**2-47 Information to Bidders.** To the extent reasonable and practicable and consistent with security regulations, any bidder or his authorized representative upon proper inquiry shall be given the name of the successful bidder, the bid amount and other authorized information.

## SECTION III. CONTRACTS FOR ENGINEERING AND CONSTRUCTION SERVICES WITHOUT FORMAL ADVERTISING

## 3-36.1 Permissible Deviation.

## 3-37 Negotiation Procedure.

## 3-38 Letter Agreements.

## SECTION III. CONTRACTS FOR ENGINEERING AND CONSTRUCTION SERVICES WITHOUT FORMAL ADVERTISING

3-10 *Scope.* This Section sets forth (a) the circumstances under which engineering and construction services will be obtained without recourse to the formal advertising procedures set forth in Section II, and (b) the procedures and practices to be followed in entering into lump sum or unit price contracts without formal advertising. Procedures and practices with respect to cost-plus-a-fixed-fee contracts for engineering and construction services are contained in a separate Section IV because of the extent of the necessary provisions and confidential nature of a portion of the text.

## PART I. PERMISSIBLE USE

3-11 *Basic Authority.* Managers of Operations are authorized, subject to the provisions of Section I, to let prime contracts without following the formal advertising procedures set forth in Section II when the procedure followed in letting the contract.

(a) complies with the requirements of Section 3709 of the Revised Statutes (41 U. S. C. sec. 5), or

(b) is authorized under the Atomic Energy Act of 1946.

3-12 *Application of Section 3709.* R. S. Sec. 3709, as amended August 2, 1946, provides as follows:

"Sec. 9 (a). Unless otherwise provided in the appropriation concerned or other law, purchases and contracts for supplies or services for the Government

may be made or entered into only after advertising a sufficient time previously for proposals, except (1) when the amount involved in any one case does not exceed \$100, (2) when the public exigencies require the immediate delivery of the articles or performance of the service, (3) when only one source of supply is available and the Government purchasing or contracting officer shall so certify, or (4) when the services are required to be performed by the contractor in person and are (A) of a technical and professional nature or (B) under Government supervision and paid for on a time basis. Except (1) as authorized by Section 29 of the Surplus Property Act of 1944 (50 U. S. C. App. 1638), (2) when otherwise authorized by law, (3) when the reasonable value involved in any one case does not exceed \$100, sales and contracts of sale by the Government shall be governed by the requirements of this section for advertising.

"(b) Exemptions from Section 3709, Revised Statutes, in other laws in amounts of \$100 or less are hereby repealed."

Subcontracts are not subject to the provisions of Section 3709. Subcontracts on a lump sum or unit price basis for construction services will be let, insofar as practicable, in accordance with the procedures set forth in Section II and, in any event, the letting of lump sum or unit price subcontracts will meet the requirements of Part 2 of this Section III. As stated in Part 3 of Section I, Section 3709 generally is applicable to the letting of prime contracts. This statute will be complied with if—

(a) the contract is let in accordance with the formal advertising procedures of Section II; or

(b) circumstances exist which make applicable one of the four exceptions enumerated in the statute and reviewed in the following paragraphs 3-12.1 through 3-12.4. Paragraphs 3-13.—pertaining to the application of the Atomic Energy Act to contracts, states certain circumstances under which contracts may be let without following the formal advertising procedures. The letting of contracts under these circumstances also may be justified in some instances under Section 3709. Whether Section 3709 or the Atomic Energy Act is used in the justification on Form 1036 will be decided by the Office of the General Counsel.

**3-12.1 Amount Less Than \$100.** Construction contracts in an amount less than \$100 are not subject to the advertising requirements of the statute. Letting of more than one contract as a subterfuge to bring the same within this exception is not to be permitted.

**3-12.2 Public Exigency.** Construction contracts may be let without advertising when the public exigencies require their immediate performance. In order for this exception to be applicable, the need must be compelling and of unusual urgency, as when the Government would be seriously injured, financially or otherwise, if the services were not performed by a certain date, and when they could not be performed by that date if they were obtained by means of formal advertising. This exception might be applicable where a facility must be altered or repaired immediately in order not to interfere with essential production and the need for the work could not have been reasonably foreseen.

**3-12.3 Sole Source of Supply.** Construction contracts may be let without advertising when only one source of supply for such services is available and the Commission's representative shall so certify. A statement of facts upon which the opinion as to the existence of a sole source of supply is based must be furnished by the Commission's representative. This exception might be applicable where a proprietary article which must be purchased from the manufacturer or sole distributor is the only one suitable, and it is customary or necessary to purchase the article on an installed basis.

**3-12.4 Personal Services.** The exception as to services required to be performed by the contractor in person is not applicable to contracts with firms of architect-engineers or to construction services which involve performance of services by more than one individual.

**3-12.5 General Limitation.** The interpretation and application of these exceptions have been the subject of numerous decisions by the Comptroller General. Where there is any reasonable doubt of the application of these exceptions to the circumstances of a case, advice should be sought from the Office of the General Counsel.

**3-13 Application of Exemptions Contained in the Atomic Energy Act.** In general, the other exceptions to the advertising requirements of Section 3709 are found in the provisions of the Atomic Energy Act of 1946. The scope of the exemptions under the Act depends in considerable part upon the factual justifi-

cation for the proposed manner of letting the contract. The manner in which it is proposed to solicit proposals from available prospective contractors, as well as the nature and urgency of the work, are important elements in this factual justification. The circumstances under which exemptions under the Act may be available are outlined in the following paragraphs. The advice of the Office of the General Counsel should be obtained where there is any doubt as to their application to any particular case.

**3-13.1 Practicality.** Formal advertising procedures may be dispensed with when it is not reasonably practicable to secure adequate competition through use of that procedure. Circumstances in which this condition is usually present are:

(a) When the information necessary to be furnished bidders includes restricted data, or when performance of the work will involve access to restricted data, and it will not be practicable to obtain necessary security clearance of personnel of the successful bidder within a reasonable time after submission of the bid. Where this exception is applicable contracts will be let either on a lump sum basis in accordance with the procedure provided in Part 2 of this Section, or if a lump sum basis is not practicable, on a cost-plus-a-fixed-fee basis in accordance with the procedure provided in Section IV.

(b) When the contract is for furnishing architect-engineer services. Contracts for these services will be let in accordance with the procedure prescribed in Part 3 of this Section or if a lump-sum basis is not practicable, that prescribed in Section IV.

(c) When it is impossible to draft, for a solicitation of bids, adequate plans and specifications or any other adequately detailed description of the required services.

(d) When, in order to meet essential program requirements by a certain date, construction work must be commenced prior to development of adequate information upon which to solicit bids by formal advertising.

**3-14 Statement and Certificate of Award.** In connection with every prime contract let pursuant to the provisions of this Part I of Section III, including contracts made pursuant to Parts 2 and 3 of Section III and Section IV, the Commission's representative shall prepare and execute a statement and certificate of award on Standard Form 1036, which shall be attached to the original documents and papers constituting the contract which are to be forwarded to the General Accounting Office. The advice of the Office of the General Counsel should be obtained in preparing Form 1036.

## PART 2. AWARD OF LUMP-SUM OR UNIT-PRICE CONSTRUCTION CONTRACTS WITHOUT FORMAL ADVERTISING

**3-20 Scope.** This Part 2 sets forth the prescribed procedures for letting lump-sum or unit-price construction contracts by invited bids and by negotiation. The procedure in awarding lump-sum architect-engineer contracts is set forth in Part 3 of this Section III, and the procedure for letting cost-plus-a-fixed-fee engineering and construction contracts is set forth in Section IV.

**3-21 Use of Invited Bids.** The invited bids procedure will be used when: (a) formal advertising is not feasible for one of the reasons enumerated in Part I of this Section, and (b) adequate information is available for the solicitation of bids.

**3-22 Procedure.** In general, the procedures followed in letting a contract by invited bids is similar to the formal advertising procedure. The objective is to obtain as full and free competition as is feasible under the circumstances. The procedure will differ to the extent indicated in the following paragraphs.

**3-23.1 Method of Soliciting Bids.** No notice need be posted in a public place nor need notice be given in any trade journals or newspapers. Bids, however, should be solicited from as many qualified contractors as it is feasible to do so. Construction work must not continue to be let, time after time, to a small group of contractors for the sole reason that they have received previous security clearance. If restricted data is involved, consideration should be given to increasing the number of qualified contractors by having security clearance obtained for the personnel concerned in preparing the bid.

**3-22.2. Submission of Bids.** If in exceptional cases time does not permit, formal bids need not be obtained, but any oral bids must be confirmed by written bids prior to award. Prior approval of the Commission's representative must be obtained to solicitation of oral bids.

3-22.3. *Opening of Bids and Award.* No formal opening of bids is required, but to encourage full, free and fair competition the provisions of Part 3 and 4 of Section II should be followed closely. While award of the contract to the lowest bidder as to price is not required where not in the best interests of the Government, award to other than the low bidder should seldom be necessary since the bidders have been selected for financial and technical qualifications. The factors, other than price, that may be considered in making an award are set forth in paragraph 2-46.

3-23 *Lump-Sum or Unit-Price Construction Contract by Negotiation.* Construction contracts may be let on a lump-sum or unit-price basis without formal advertising or invited bids, referred to as negotiation in this paragraph, when

(a) only one bid has been received after formal advertising or invited bids, provided that award may be made on the one bid as submitted, and that in no case may the price paid after negotiation exceed the amount bid.

(b) there is only one source for the furnishing of the construction services, or

(c) no responsive bid has been received from a responsible bidder after formal advertising or invited bids,

and the Commission's representative is able to satisfy himself that a lump-sum or unit-price contract at the price negotiated is in the interests of the Government. If a price which appears to be fair and reasonable cannot be negotiated, consideration should be given to letting the contract on a cost-plus-a-fixed-fee basis. Determination of whether the price is fair and reasonable should be supported by a written memorandum setting forth the Commission's estimate, market information and other available sources of information.

#### PART 3. LUMP-SUM CONTRACTS FOR ARCHITECT-ENGINEER SERVICES

3-30 *General.* The procedures in selection and the method of negotiating lump-sum architect-engineer contracts are similar to, and in many instances, identical with, those used for cost-plus-a-fixed-fee architect-engineer contracts. Accordingly, to avoid repetition cross reference will be made in this Part to the appropriate paragraphs of Section IV.

3-31 *Definition.* A large-sum contract for architect-engineer services provides for the payment of a fixed amount or lump sum to the contractor for the furnishing of architect-engineer services. It may, and as provided in this Part, does, include reimbursement for specified items of cost.

3-32 *Prescribed Use.* A lump-sum contract for architect-engineer services should be used whenever it is practicable to compile in advance of the preparation of plans and specifications adequate information specifically describing the character and extent of services required. The development of this information will not be practicable where (a) the time limits for commencement or completion of the work do not permit advance development of the information, or (b) the nature of the work is such that substantial technical development is required before these data will become available.

3-33 *Selection.* The procedure used in the selection of Architect-Engineers to furnish services on a lump-sum basis is the same as that set forth in paragraph 4-23 of Section IV. The responsibilities of the Contract Board with respect to the selection of Architect-Engineers for both prime contracts and subcontracts under prime cost-type operating contracts is contained in the transmittal GM Bulletin (Appendix I).

3-34 *Required Information.* Before negotiating a lump-sum architect-engineer contract it will be necessary to have the same information set forth in paragraph 4-33 of Section IV, as well as a description of the work as set forth in paragraph 4-36. The information as to the work should be in more detail and on a firmer basis, particularly as to estimated cost, than for a cost-plus-a-fixed-fee contract.

3-35 *Determination of Lump Sum.* The basic policy with respect to fees set forth in paragraph 4-41 is also applicable to the determination of the lump sum to be paid on architect-engineer contracts. A schedule for lump-sum architect-engineer contracts is included in Exhibit IIA. Amounts in excess of the maximum derived from this schedule as adjusted by the provisions of this Part 3 will not be negotiated with respect to original contracts or change orders or supplemental agreements covering additional or less work than was originally contemplated; provided, that if, because of unusual circumstances, a Manager of Operations believes an amount higher than the maximum should be negotiated for particular services, the Manager may request approval for such higher amount from the appropriate Division Director. In this event the request must set forth in

writing the recommended amount and the circumstances and reasons justifying payment of a larger amount.

3-35.1 *Factors Governing Amount.* The schedule in Exhibit II for lump-sum architect-engineer contracts shows the maximum amount (not including the reimbursements referred to hereinafter) to be paid to Architect-Engineers who render all of the services enumerated in paragraph 4-33 for the most complex work to be performed within a normal period. The adjustments are as follows:

(a) For complexity, the same classifications and deductions for the respective classes as those set forth in paragraph 4-42.2 are made from the lump-sum amount derived from the schedule.

(b) For less than full services, percentage deductions within the same ranges as those set forth in paragraph 4-42.3 are made from the lump-sum amount derived from the schedule.

(c) For lay-out or design of manufacturing and operating equipment, its estimated cost or a proportion thereof may be included in determining the lump-sum amount under the circumstances described in paragraph 4-42.5.

(d) For period of service, if an exceptional case arises in which an adjustment of the lump sum appears necessary because of a considerable variance in a normal period of service, the Manager of Operations should forward his recommendations as to the adjustment to be made to the appropriate Division Director.

3-36 *Reimbursable Costs.* The lump-sum amount derived from the schedule, as adjusted by the factors described above, is to be complete compensation to the Architect-Engineer for all the required services except that the Architect-Engineer may be reimbursed for the direct costs of the following items:

(a) Necessary topographical and other field surveys, test borings, and other subsurface investigations which he or his subcontractor may be required to make.

(b) Making *major* changes and deviations from the *approved* preliminary work that may involve either restudy or redesign.<sup>2</sup>

(c) Salaries, including pay-roll costs approved by the Commission's representative, of field engineers and inspectors employed by the Architect-Engineer at the site for the inspection of the construction work and their "on site" transportation. (Compensation for a responsible resident representative together with the required office force, other than the field engineers and inspectors, is included in the lump sum.) "On site" transportation does not include transportation to or from living quarters.

(d) Employment of expert technical assistance when approved by the Commission's representative (this may include services of material testing laboratories).

(e) Furnishing more than 20 copies of drawings and documents.

(f) Traveling expenses for extraordinary services, such as expediting, or inspecting materials and equipment at vendors' plants.

3-36.1 *Permissible Deviation.* If considered to be in the best interests of the Government, the lump sum to be paid the Architect-Engineer may be increased by an amount sufficient to include the estimated cost of any one or of all the items described in subparagraphs (a) to (f). The calculation of the lump sum, to be shown as a part of Exhibit I, shall clearly show the amount included for each of these items.

3-37 *Negotiation Procedure.* The procedure in negotiating lump-sum architect-engineer contracts is similar to that set forth in Part 7 of Section IV for negotiating cost-plus-a-fixed-fee contracts. GM Bulletin No. 44 relative to approval of wage, salaries, benefit plans, etc., on cost-plus-a-fixed-fee contracts is inapplicable except to approval of salaries of field engineers and inspectors or other reimbursable personnel.

3-38 *Letter Agreements.* Authorizations to proceed under a letter agreement, as provided in paragraph 4-72, should be avoided whenever possible. In any event, the letter agreement should contain the essential items agreed upon during the negotiations.

<sup>2</sup> An addition to this manual will be issued on the subject of change orders and supplements to contracts.

## SECTION IV. COST-PLUS-A-FIXED-FEE CONTRACTS

## TABLE OF CONTENTS

Para-  
graph

4-10 Scope.

## PART I. USE OF COST-PLUS-A-FIXED-FEE CONTRACTS

4-11 Definition.

4-12 Prescribed Use.

4-12.1 Contracts for Architect-Engineer Services.

4-12.2 Contracts for Construction Services.

4-12.3 Engineer-Constructor Contracts.

4-12.4 Subcontracts.

PART 2. SELECTION OF ARCHITECT-ENGINEERS AND CONSTRUCTION  
CONTRACTORS

4-21 General.

4-22 Authority.

4-23 Procedure in Selection.

4-23.1 Eligible Firms.

4-23.2 Final Selection.

4-23.3 Submission to Division Director.

4-24 Records.

PART 3. ENGINEERING AND CONSTRUCTION INFORMATION  
REQUIRED IN NEGOTIATING CONTRACTS

4-31 General.

4-32 Type of Service.

4-33 Extent of Services of Architect-Engineer.

4-34 Extent of Services of Construction Contractor.

4-35 Extent of Services of Engineer-Constructor.

4-36 Description of the Work.

4-37 Estimated Cost and Time for Completion.

## PART 4. FEES ON COST-PLUS-A-FIXED-FEE CONTRACTS

4-41 Basic Policy With Respect to Fees.

4-42 Factors Governing Amount of Fixed Fee and Deduction from Maximum  
Fee Schedules for Architect-Engineers.

4-42.1 General.

4-42.2 Complexity of the Work.

4-42.3 Completeness of Services.

4-42.4 Nonreimbursable Representative.

4-42.5 Manufacturing and Operating Equipment.

4-42.6 Period of Service.

4-43 Factors Governing Amount of Fixed Fee and Deductions from Maximum  
Fee Schedule for Construction Contractors.

4-43.1 General.

4-43.2 Complexity of the Work.

4-43.3 Nonreimbursable Representative.

4-43.4 Manufacturing and Operating Equipment.

4-43.5 Period of Service.

4-43.6 Subcontracting.

4-43.7 Construction Equipment.

4-44 Factors Governing Amount of Fixed Fee and Deductions From Maximum  
Fee Schedules for Engineer-Constructors.

4-45 Fixed Fees on Subcontracts.

## PART 5. SALARIES AND WAGES UNDER COST-PLUS-A-FIXED-FEE CONTRACTS

4-50 G. M. Bulletin No. 44.

## PART 6. ALLOWANCES FOR WORK IN MAIN OR GENERAL OFFICE

- 4-60 General.
- 4-61 Architect-Engineer.
- 4-62 Construction Contractors.
- 4-63 Engineer Constructors.

## PART 7. PROCEDURE IN NEGOTIATING COST-PLUS-A-FIXED FEE CONTRACTS

- 4-70 Exchange of Information.
- 4-71 Conclusion of Negotiations.
- 4-72 Letter Agreements.

## SECTION IV. COST-PLUS-A-FIXED-FEE CONTRACTS

4-10 *Scope.* This Section sets forth (a) the circumstances with respect to which cost-plus-a-fixed-fee contracts will be used, (b) selection of Architect-Engineers and cost-plus-a-fixed-fee Construction Contractors, (c) required information to negotiate contracts, (d) on cost-plus-a-fixed-fee contracts, (e) salaries and wages under cost-plus-a-fixed-fee contracts, (f) allowance for work in general offices, and (g) procedure in negotiating contracts.

## PART 1. USE OF COST-PLUS-A-FIXED-FEE CONTRACTS

4-11 *Definition.* A cost-plus-a-fixed-fee contract provides for the payment of all the contractor's allowable costs as defined in the contract; it establishes an estimate of the total cost; it provides for the payment of a fixed fee which does not vary with the actual cost, but is adjusted only in the event a material change in scope or character of the work is ordered by the owner.

4-12 *Prescribed Use.*

4-12.1 *Contracts for Architect-Engineer Services.* In general, cost-plus-a-fixed-fee contracts and subcontracts for architect-engineer services may be utilized only when it is impracticable to compile in advance of the preparation of plans and specifications adequate information specifically describing the character and extent of services required. The development of this information will not be practical where (a) the time limits for commencement or completion of the work do not permit advance development of the information, or (b) the nature of the work is such that substantial technical development is required by the Architect-Engineer before these data will become available.

4-12.2 *Contracts for Construction Services.* Prime cost-plus-a-fixed-fee construction contracts will be entered into only if one of the exceptions set forth in Part 1, Section III is applicable, and it is not practicable to let the contract by invited bids as set forth in Part 2 of Section III. Cost-plus-a-fixed-fee subcontracts will be entered into only if it is not practicable to use a lump sum or unit price contract.

4-12.3 *Engineer-Constructor Contracts.* Cost-plus-a-fixed-fee contracts and subcontracts for both architect-engineer and construction services (called Engineer-Constructor contracts) should not be made except (a) for the reasons set forth in paragraph 4-12.1 for the engineering services, (b) for the reasons set forth in paragraph 4-12.2 for construction services, and (c) where it is manifestly to the advantage of the Commission to combine engineering and construction services in one contract.

4-12.4 *Subcontracts.* The procedures and practices prescribed in this Section IV are applicable to cost-plus-a-fixed-fee subcontracts for architect-engineer or construction services except that Managers of Operations will determine the most appropriate manner for the Contract Board to operate as provided in the transmittal Bulletin.

## PART 2. SELECTION OF ARCHITECT-ENGINEERS AND CONSTRUCTION CONTRACTORS

4-21 *General.* The most important consideration in obtaining economical and efficient performance of work under a cost-plus-a-fixed-fee contract for engineering or construction services is the selection of the firm best qualified to perform the work, considering all applicable factors. The amount of the fee, which is relatively small in proportion to the total construction cost, the adequacy of contractual provisions, or the effectiveness of contract administration, cannot offset the disadvantage in employing an unqualified firm.

4-22 *Authority.* The Manager of Operations is responsible for the selection of Architect-Engineers, Construction Contractors, and Engineer-Constructors en-

gaged upon a cost-plus-a-fixed-fee basis. Under the G Bulletin transmitting this manual, one of the responsibilities of the Contract Board is to recommend to the Manager the Architect-Engineer or Construction Contractor to be awarded a prime contract.

**4-23 Procedure in Selection.** The procedure in selection of Architect-Engineers, Engineer Constructors, and cost-plus-a-fixed-fee Construction Contractors for both prime contracts and subcontracts is as follows:

**4-23.1 Eligible Firms.** The objective should be to give consideration to as many firms within practical limits as may offer possible qualifications for performance of the work. This objective is attained from:

(a) An analysis of the requirements of the work considering such factors as—

- (i) the nature of the work;
- (ii) the magnitude of the job;
- (iii) the time of performance; and
- (iv) the conditions under which the work is to be performed, such as location of the work, local labor conditions, and relations with other contracts.

(b) Available information as to firms possibly meeting these requirements. This information may be derived from:

- (i) the general experience of those making the selection;
- (ii) data furnished to the Office of Operations by Architect-Engineers and Construction Contractors interested in performing Commission work;
- (iii) previous performance for the Commission;
- (iv) information furnished by the Construction-Engineering Branch of the Production Division if requested by the Office of Operations; and
- (v) other various sources, such as trade journals, professional societies, other Architect-Engineers and contractors, etc.

**4-23.2 Final Selection.** To screen the firms which are to be further considered and, finally, to determine the firm best qualified to perform the work, additional data are developed on the factors set forth below through further information supplied by the firms either by letter or through personal interviews, inspection of the facilities of the firm, and any other sources which will supply pertinent and reliable information. The factors are as follows:

(a) Reputation and standing of the firm and its principal members in performance of the contemplated type of work.

(b) Past record in performing work for the Commission and, if available, for other Government agencies.

(c) Adequacy of any necessary home office facilities.

(d) The volume of work of the firm in previous years, and the extent to which the firm is currently engaged in other work.

(e) Ability to assign an adequate number of qualified key personnel, including a resident representative having considerable experience in responsible positions on work of a similar nature.

(f) Additional management qualifications:

(i) its record in labor relations, particularly, effectiveness in preventing work stoppages, and the possible effect of labor relations policies and practices on other contractors performing work at the site;

(ii) its safety record;

(iii) the adequacy of its accounting system.

(g) Ability of the firm to perform a major portion of the work with its own forces.

(h) Ability of the firm to furnish or to obtain adequate construction plant and to procure required materials and equipment.

(i) Financial resources.

(j) Geographic location of the home office and familiarity with the locality in which the project is located.

**4-23.3 Submission to Division Director.** For engineering or construction contracts, including both prime contracts and subcontracts, in which the estimated cost of the construction work is in excess of \$2,000,000, the Manager of Operations should advise the appropriate Division Director of the firms being considered when the number has been reduced to three or four.

**4-24 Records.** The Contract Board should maintain the following records:

(a) As to eligibility, to the extent reasonably practicable, a current record of engineering and construction firms which might be available for work at the Office of Operations, and their qualifications.

(b) As to selection, a record which will:

(i) show the procedure which was followed in the selection of Architect-Engineers and cost-plus-a-fixed-fee Construction Contractors;

(ii) show the reasons for the selection of the firm, including evaluation of the factors set forth in paragraph 4-23;

(iii) show the other firms considered and the reasons they were not selected.

(c) As to performance, a record which will show the effectiveness with which the firm performed cost-plus-a-fixed-fee work, in order that its qualifications may be evaluated in the light of the factors set forth in paragraph 4-23 for any further work at the Office of Operations or at other Offices of Operations. A copy of this record, which should be marked "Confidential," shall be forwarded to the Director of the Division of Production, Attention: Construction-Engineering Branch.

### PART 3. ENGINEERING AND CONSTRUCTION INFORMATION REQUIRED IN NEGOTIATING COST-PLUS-A-FIXED-FEE CONTRACTS

4-31 *General*. Before attempting to negotiate a cost-plus-a-fixed fee contract for engineering or construction services, the following information set forth in this Part 3 should be developed in written form and included as a part of Exhibit I.

4-32 *Type of Service*. Statement regarding type of service required, that is, Architect-Engineer, Construction Contractor, or Engineer-Constructor.

4-33 *Extent of Services of Architect-Engineer*.

(a) Statement showing the extent to which the services of the Architect-Engineer include those set forth in the following three titles:

#### *Title I*

Provide the necessary topographical and other field surveys, test borings, and other subsurface investigations; prepare preliminary studies, sketches, and lay-out plans and reports, including estimates of cost of the proposed project and of all structures, utilities, and appurtenances thereto.

#### *Title II*

Complete design of the work, including preparation of all required preliminary and final working drawings, specifications, estimates, and contract documents; assist in securing, analyzing, and evaluating bids or proposals for construction, check shop drawings, and consult with the owner on all questions arising in connection with the services performed by the Architect-Engineer.

#### *Title III*

Complete architect-engineer supervision and inspection of construction under the direction of a responsible representative. Furnishing of record drawings to show construction as actually accomplished.

(b) A statement showing whether the services of the Architect-Engineer will include the furnishing of a nonreimbursable representative who shall be in responsible charge of the work.

(c) Statement showing whether the services of the Architect-Engineer include process design. Process design normally requires the preparation of flow diagrams showing each operating step to perform the process, the nature, capacity and design characteristics of production equipment, and the general design of connecting flow lines to handle the calculated rates of product and byproduct flow. Under ordinary circumstances the Architect-Engineer is not required to furnish process design.

4-34 *Extent of Services of Construction Contractor*. A statement showing whether the services of the Construction Contractor include:

(a) Construction with the contractor's own forces of all work except specialty items normally subcontracted.

(b) Procurement of all required materials.

(c) Procurement of all manufacturing equipment.

(d) Installation of manufacturing equipment.

(e) Complete management of construction under the direction of a non-reimbursable resident representative who shall be in responsible charge of the work.

**4-35 Extent of Services of Engineer-Constructor.** A statement showing whether the services of the Engineer-Constructor include all of the services set forth in paragraphs 4-33 and 4-34.

**4-36 Description of the Work.** Statement containing a sufficiently detailed description of the work to permit the degree of complexity of its principal components to be evaluated adequately. The estimated cost of the component items should be furnished insofar as applicable and this should include the description and estimated cost of:

(a) Buildings and other structures for which complete designs and specifications are to be prepared by Architect-Engineer, including number and unit cost of each type, with as much information as is available (within security requirements) as to the functional requirements for such structures.

(b) Utilities, giving classifications and unit prices in as much detail as practicable.

(c) Manufacturing equipment to be—

(i) procured by operating contractor or furnished by the Commission;

(ii) to be procured by Construction Contractor or Engineer-Constructor;

(iii) designed by Architect-Engineer; and

(iv) installed by the Construction Contractor or by the Engineer-Constructor.

**4-37 Estimated Cost and Time for Completion.** Statement disclosing (a) total estimated cost of the work exclusive of Construction Contractor's fee, showing separately any amount included for contingencies, and (b) estimated time of completion of design or construction work.

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

THURSDAY, MAY 26, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The committee met, pursuant to notice, at 10 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon (chairman), Representative Durham (vice chairman), Senators Connally, Vandenberg, Knowland, and Hickenlooper; Representatives Holifield, Price, Jackson, Elston, Hinchshaw, and Van Zandt.

Also present: David E. Lilienthal, Chairman, Sumner T. Pike, Lewis L. Strauss, and Gordon E. Dean, Members, United States

Lewis L. Strauss, and Gordon E. Dean, members, United States

The CHAIRMAN. The committee will come to order.

We meet this morning as a result of charges against the Atomic Energy Commission and numerous congressional demands that the Chairman of the Commission be removed from office. Requests for a thorough investigation have been made by Members of the Congress, including members of this committee.

The Chairman of the Commission, Mr. Lilienthal, in a letter to me dated May 25, requested an early opportunity to be heard. For these reasons today's meeting is being held.

I need not emphasize that we are dealing with matters of grave import. This would seem to be a good time for an impartial and independent committee reevaluation of the Nation's atomic energy project, both its good points and its bad. The Joint Committee on Atomic Energy should make a complete inquiry into the grave charges which have been made—so far as possible through public and open hearings.

Now, the Commission is here; the Chairman is here. Mr. Lilienthal, have you a statement which you wish to make in your own behalf and on the behalf of the Commission?

## STATEMENT OF DAVID E. LILIENTHAL, CHAIRMAN, ATOMIC ENERGY COMMISSION

Mr. LILIENTHAL. Yes, Mr. Chairman, and members of the committee, I do have a statement, and it would be helpful to me if I could make this initial statement continuously with questions to follow the statement, if that is consistent with the wishes of the chairman and the committee.

We are happy that this committee of the Congress is providing an opportunity for the Atomic Energy Commission of the United States to render an accounting of its stewardship, a full and complete accounting of this important and serious stewardship which we bear to the Congress, to the President, and to the country. We hope and believe there will be a full opportunity for an accounting.

The country can only appraise the charges, the grave charges, that have been made if the country has before it, through the medium and forum provided by this, the Legislative Committee of the Congress, an opportunity to hear not only of the mistakes and inadequacies of the operation of these some 60,000 individuals who make up the atomic energy enterprise of the country, but also of the accomplishments of this Commission.

I would like to make clear at the outset that we are firmly of the opinion that a full accounting can be made to the country without the revelation of any secret information. This is basic. There are some things, of course, of which this is not true and those must be reserved for an executive session, but it is our opinion, as will be indicated in the outline to which I will come in a moment, that there are ways through the resourceful utilization of the flexibility of democratic methods whereby an accounting of a major public trust, close to the lives and fortunes of the people of this country, can be made to the country before this committee and in public, if supplemented by executive sessions on secret matter.

Later on I shall indicate what is, in our opinion, one or perhaps many devices that can be employed to secure an opportunity for an appraisal, both of the mistakes and of the accomplishments of the Commission.

We strongly urge that the committee make a full report to the American people on these charges. They are grave charges, they are charges which affect the confidence of the American people in the state of their atomic readiness as well as in the progress that has been made in the development of new secrets to supplement the older secrets, and in the progress that has been made toward peaceful applications of this force.

These are charges that affect at once the morale of scientists and contractors—industrial contractors, university contractors—at a time when, in our opinion, as was indicated in the public report to the Congress recently filed, the atomic energy enterprise has come up from a position of being bogged down to a time when it is really rolling.

We are dealing here with something strange and new, and particularly strange and new for government. We are dealing with fundamental forces of nature, forces that are largely unknown, and which have important security implications. Therefore, it is but natural that there should be fears, apprehension, and, inevitably, dangers of panic—fears which are natural enough in dealing with forces of nature which are so little known, so portentous, so little known even by scientists, to say nothing of laymen. These fears have been accentuated by the charges that have been made and by the particular episodes involving instances of operations which have been described before this committee during the past 2 weeks.

We feel in this circumstance, and I gather that this is the disposition of the committee, that it is urgently necessary to tell the country.

whether we are, as implied, virtually bankrupt atomically, and to tell the world where we stand.

As I say, we can do this, we believe adequately, without the disclosure of secret information. So great is our faith in the adaptability of democratic processes even to as difficult a situation as this, that we believe a division line can be made and explicitly made between secret and nonsecret. If we did not believe so, then this would be a rather sad day indeed.

In the most solemn way possible we urge a speedy public report and public hearings on these charges, and we have in this respect some specific proposals to offer. We do not minimize the difficulties—we believe they can be met. We ask that in this inquiry there be a full investigation, not only one dealing with particular episodes and the occurrences and instances of operation, such as the missing uranium oxide and the fellowship issue but where, on the fundamental questions, we are after 2 years of the operation of the Atomic Energy Commission under the McMahon Act.

It seems to me—I submit it with the greatest respect and the deepest concern—that if, when grave charges are made from high places, there is no way for the people themselves to get a picture of the basic results achieved and get a chance to make up their own minds, a chance for the responsible press and radio and others of the country to judge, then this is a tragic chapter in the history of self-government. I do not believe that is the necessary conclusion to be drawn.

The outline that we will present indicates one proposal—I am sure there will be many others—whereby this dilemma can be met. We believe this is one of the deep issues here; this is one that my colleagues and I have talked about in speeches and in reports to Congress for the past 2 years—the need for the people to know the essential facts and results without infringement of secrecy and security. We believe these public hearings can show the world that American self-government can still function despite the real need for secrecy in technical areas.

As I say, we believe there is, then, a great and a solemn issue here, far more important than individuals, and even more important, in a sense, than the operations of a great enterprise. This is a time of tension which will undoubtedly continue for some years to come.

We propose that this inquiry deal not with incidents and cases alone, although these are important and should be explored to the full, but also to consider how the American people can know about their own business, their own security, their own future prospects, and yet not jeopardize the security of information and other aspects of security.

What are the ways by which the people can know where we stand, it having been asserted that we have an enterprise which is incredibly mismanaged, in which there is misplaced emphasis, and in which there is maladministration? What are the ways by which people can determine whether these broad accusations and inferences mean in a sense insolvency, that here is a concern virtually insolvent and weak, or whether it has progressed upward and is in a relatively strong position?

How can the people know what we inherited, what this Commission inherited from the Manhattan District, what the conditions were at

the time this management began, and whether we have gone up or down or simply held our place?

There are a number of obvious possibilities. This could be learned from the President, it could be learned from the Commission—and, to a considerable extent, this Commission has tried to do that in the reports, public reports, that have been presented to the Congress—and from the Commission witnesses. It can be learned from the Joint Committee by way of appraisals and interpretations, on the basis of a full hearing, both public and executive. And it can be learned from experts of great renown and distinction in this country, who know about this undertaking, who as advisers to the Commission or because of their standing in the technical, scientific world or in the world of affairs can present an interpretation and an appraisal to the Committee in open session without violation of security and in closed session on matters of greater detail.

The Joint Committee's own information as to the solvency or insolvency of this undertaking is extensive. The only major omission of information of which I am aware deals with the numbers of atomic weapons now contemplated and in stock pile and the rate of production. These are matters of which at the very first hearing of the Senate side of this Committee, involving the confirmation of the Commissioners and General Manager, it was clear, and this position has not been changed, that for reasons of security the committee itself did not request this information.

The reports to the Joint Committee on Atomic Energy during the past session of Congress are extensive. I have here a listing of over a hundred communications of various categories, ranging from non-classified letters to top secret documents, and there have been about 25 meetings of this committee during this session of Congress. There have been almost daily, I should suppose daily, discussions between the staff of the Commission and the staff of the committee, so that the committee has a great deal of information, both secret and nonsecret, and the people themselves do not have, of course, what the committee has.

This is not difficult to explain. Obviously, any material that is delivered to this committee of a secret category cannot be made public without its being made public to potential enemies.

The real issue, then, is how we are going to have a chance to respond to these charges, which obviously shake the confidence of people and make them apprehensive as to where we stand, how strong we are, what is going on.

I recall, in September 1945, a meeting I attended in Chicago which was held shortly after the drops at Hiroshima and Nagasaki, a meeting also attended by Chester Barnard, at that time president of the New Jersey Bell Telephone Co., now director of the Rockefeller Foundation. He said to me in an informal conversation something that has recurred to me many times. He said, "When I first heard on the radio on August 5 that an atomic weapon had been detonated, had been achieved and detonated, I turned to my wife and said, 'This is the end of democracy.'"

I do not believe that is by any means true, although the natural reaction at the time perhaps was justified, but here, in any case, is a test, and we therefore urge the committee to make a full and careful investigation and make a report and appraisal to the country.

We ask for an appraisal before you by great experts who have been consulted by the Commission, who are familiar with these operations, men about whose impartiality and standing there can be no doubt. We are dealing here with technical and scientific matters, and management matters of great difficulty, difficulty never before met because of the secret character of the undertaking and the strange and unknown facts with which men have to deal.

I should like, if I may, to refer to a number of individuals who, I believe, could be helpful in their appraisal of the state of this undertaking and who could do this, I believe, in open hearing and without any violation of security, and who could follow that by discussions with the committee in closed hearing.

I should like, if I may, to give the names of these men, because I believe it is necessary that men of great renown and experience participate with you in this inquiry.

Among industrial men who are qualified, in our opinion—and there are other individuals, I am sure, but these are a sampling—is Mr. George T. Felback, vice president, Carbide & Carbon Chemical Corp.; Dr. Charles A. Thomas, executive vice president, Monsanto Chemical Co.; Mr. Harry A. Winne, vice president, General Electric Co.; Mr. Malcolm Ferguson, president, Bendix Aviation Corp.; Mr. James W. Parker, president and general manager, Detroit Edison Co.; Mr. Isaac Harter, executive vice president and director, Babcock & Wilcox Tube Co., one of the great engineers of the country; Mr. E. V. Murphree, president, Standard Oil Development Co.

As to accountability, the technical problems, the management problems, the operating problems of accountability for source and fissionable materials, we would suggest the name of Mr. Manson Benedict, Hydro Carbon Research, Inc.

As to raw materials, we would suggest Dr. Donald H. McLaughlin, president, Homestake Mining Co.

All these men are men who are familiar with this undertaking.

In the field of biology and medicine, a very important aspect of this work and a very important part of any accounting of our stewardship. I suggest, among others, Dr. Robley D. Evans, professor of biophysics, Massachusetts Institute of Technology; Dr. James Sterner, medical director, Eastman Kodak Co.; Dr. Joseph T. Wearn, dean of the school of medicine, Western Reserve University; Dr. G. Failla, medical school, Columbia University; Dr. Robert F. Loeb, Presbyterian Hospital, New York; Dr. Donald D. Van Slyke, Rockefeller Institute; Dr. E. C. Stakman, chief, division of plant pathology and botany, University of Minnesota; Dr. P. U. Cardon, Administrator, United States Department of Agriculture.

These men have had an opportunity to explore this undertaking at close range.

As to the scientific and technical individuals whom we suggest might well be called to advise with the committee and to make an appraisal to the country, there are a considerable number. I emphasize the importance of scientific and technical individuals because we are dependent upon the scientific community of the country to make further headway in this field. Among the General Advisory Committee members I would suggest, in particular, Dr. J. Robert Oppenheimer, who is director of the Institute for Advanced Study, Princeton, N. J., who was the wartime Director at Los Alamos; Dr. James B.

Conant, president of Harvard University; Dr. L. A. DuBridge, president, California Institute of Technology; Dr. Enrico Fermi, Institute for Nuclear Studies, University of Chicago; Dr. E. O. Lawrence, director, radiation laboratory, University of California at Berkeley; Dr. James B. Fisk, professor of applied physics, Harvard University; Dr. W. K. Lewis, dean of engineering, Massachusetts Institute of Technology; Dr. Walter G. Whitman, professor of chemical engineering, Massachusetts Institute of Technology; Dr. Robert F. Bacher, who until very recently, May 10, I believe, was a member of the original five-man Commission and who is now chairman of the division of physics, mathematics, and astronomy of the California Institute of Technology; Dr. Edward Teller of the Institute for Nuclear Studies, University of Chicago; Mr. Harvey Brooks and Mr. Kenneth Kingdon, distinguished members of the staff of General Electric Co.; Mr. William Shoupp of Westinghouse Electric Co.; Dr. Norris E. Bradbury, now the Director of Los Alamos Scientific Laboratory; Dr. Walter H. Zinn, who appeared recently before your committee in executive session, and who is Director of the Argonne Laboratory; and Dr. Frank H. Spedding, Director of the Institute for Atomic Studies at Iowa State College.

We welcome the obvious intent and purpose of this committee to make an extensive inquiry and, with a calm and dispassionate purpose, to make a sober appraisal. All of us here realize how much is at stake. This is a good time not to get rattled and not to induce jitters and not to be preoccupied solely with personalities or special or individual incidents, but to get an over-all view, and this was indicated in the Chairman's opening statement.

This program is a great asset, it is novel, it is immense. Even the wisest know little about it; we are dealing with nature in the raw; the engineers have never been confronted with the problems of design that there are here, knowing so little about the materials with which they are dealing.

What are the questions that we urge going into in order that they may become part of this accounting of stewardship? Among these we suggest the subject of weapons, of the production of raw materials and fissionable materials, of research, the question of our relations to our wartime partners, Britain and Canada.

The Commission found this relationship with the partners during the war in a confused state. It has been discussed on a number of occasions with this committee. It was found to be causing bitterness among allies and friends. An exchange of information with these countries is currently going on, as was announced last summer, in a limited way.

We suggest here that in addition to the information presently in the committee's hands, that the committee call General Eisenhower, former Under Secretary of State Lovett, and Secretary of State Dean Acheson.

It will be helpful in this connection to review this wartime arrangement and also to make clear, because I believe it is not clear to the country, what the arrangements were during the war whereby British scientists, with the approval of this Government and of the Manhattan District, engaged in the work of bomb design, development, and production, at Los Alamos and elsewhere.

Mr. Chairman, I submitted a letter to you yesterday, which I should like, if I may, to put in the record at this point.

The CHAIRMAN. Very well.

(The letter referred to above is as follows:)

UNITED STATES ATOMIC ENERGY COMMISSION,  
*Washington 25, D. C., May 25, 1949.*

HON. BRIEN McMAHON,

*Chairman, Joint Congressional Committee on Atomic Energy,*

*Washington, D. C.*

DEAR SENATOR McMAHON: A full, complete, and speedy report on the charges that the United States atomic energy program is virtually a failure is a matter urgently necessary; the investigation initiated by the McMahon committee and to be carried out by it is welcomed.

The charges by Senator Hickenlooper of "incredible mismanagement," "misplaced emphasis," and "maladministration" involve nothing less than the security of this Nation and the peace of the world.

If it is true that the atomic energy program is in an almost bankrupt condition, then this Nation, far from being the custodian and trustee of a substantial stock pile of atomic weapons, and in a favorable production situation, is in a sadly weakened condition. If this were true it is difficult to imagine any single fact more disturbing to the peace of mind of the people of the country or to the security of the world's democracies.

The facts on this crucial test of our stewardship can be readily established. That in an enterprise requiring the services of some 60,000 human beings there have been mistakes and errors goes without saying; this has been freely admitted. Working with the atom does not make human beings perfect and beyond error. For these errors and mistakes the Commission has and will continue to accept full responsibility. The failure to follow explicit Commission regulations in the matter of the uranium oxide at the Argonne Laboratory in Chicago is such an instance. In the handling of many thousands of tons of crucial materials, in various forms, the Commission and its contractor-employees have sought and will continue to seek to improve on methods of accountability that will keep the element of human fallibility at a minimum: no system can eliminate the human factor entirely.

Among the hundreds of decisions of policy thus far made by the Commission, and those that will be made in the future, there are many the soundness of which is and will be subject to differences of judgment among equally sensible men. Such a case is that concerning the scholarships for nonsecret study, awarded by the National Research Council of the National Academy of Sciences as contractor for the Commission. The policy of the Council and the Commission has in the past 10 days been changed to meet the objections, on public policy grounds, strongly expressed by Members of the Congress. But the difference was one of judgment on which equally patriotic and reasonable men could have and do entertain differing views. The export to scientists abroad, of isotopes, announced by the President in September 1947, is another instance. This was done upon the unanimous recommendation of distinguished advisors to the Commission. There are bound to be cases of underestimating of construction costs by contractors of the Commission in connection with urgently needed facilities of a wholly new kind. There are properly subject to criticism. But they were common experience during the war and today in industry generally.

The Joint Committee on Atomic Energy of the House and Senate was established by the McMahon Act to review and consider, among other things, differences of judgment on policy, and to receive and consider and appraise the rate of progress, or lack of progress, in the substantial work of this project—one of the largest enterprises and most complex in history. Numerous reports, largely secret or top secret, and frequent hearings, conferences, and staff liaison have made your committee essentially—and rightly so—a continuous congressional investigating committee.

The test of whether there has been and is "incredible mismanagement" and a grave situation in this country's atomic energy program can be made a quite specific test, or series of tests. The country, I suggest, is entitled to and will want to know the answers to such specific questions as the following, among other, and we welcome the decision of your committee to proceed to the making of such analysis and report.

(1) Has the Commission failed in its stewardship at a time of great tension in its obligation paramount to all others; i. e., the production and improvement of these complex scientific weapons? What is the state of our atomic weapons—the order of magnitude of the stock pile; the improvements made in the past 2½ years in new weapon design? What has been the progress in the past 2½ years of our stewardship? What is the progress today in still further improvements and the quality of personnel and the morale of those engaged in this work?

(2) How about production of fissionable materials—the essential ingredients of atomic weapons? Is it on a secure basis? What situation did the project face concerning disruption of production, and how successful were the steps taken to overcome them? We assert, and our reports to you have made clear, that production is now at the highest level in history, with the same facilities; that new facilities are approaching the production state.

(3) How has basic and applied research progressed since the Commission took responsibility—and where was it when the Commission took over?

(4) How about security?

What was the state of physical protection of plants when the Commission took over? Has this improved, and in what ways?

What about security of secret documents—what was the situation when the Commission began, and what is it today?

What about accountability for source and fissionable materials? What was the situation in 1947? What is it today?

(5) What about the investigation and clearance of personnel—what was the situation, and what is it today?

There are many other areas of inquiry that your committee will engage upon, in addition to those carried on by it continuously as a regular practice in the past.

But the chief question I believe is this: Is this country weak today in atomic weapons and materials, and in their production and improvements, as implied by the broad and grave charges leveled against the Commission?

It can be stated categorically that the record in this respect is a proud one. It is one to give great reassurance to the peoples of the world who, as of this hour, rely upon the strength of the United States of America.

In order that the fears and misapprehensions on this score may be settled beyond peradventure and as promptly as it is possible, it is urged that the Joint Committee call before it immediately not only the Commission, its staff, its principal industrial and university contractors but also other citizens of the highest renown and technical standing, including the distinguished members of the General Advisory Committee and other advisory groups for their testimony and appraisal. In this way the dangerous cloud of uneasiness resulting from these charges will be dispelled.

Sincerely yours,

DAVID E. LILIENTHAL,  
*Chairman, United States Atomic Energy Commission.*

Mr. LILIENTHAL. In that letter, Mr. Chairman, five tests were suggested, and I should like in the next few minutes, with your permission, to expand on this in a rather capsule form, a documentation of the kind of things we believe a full accounting of stewardship and a full appraisal to the country would require. All of the things I shall say have been carefully reviewed, and they do not involve any restricted data.

First, as to production of materials—we suggest an inquiry into, an appraisal of, and a report on raw materials, including the tenuous supply situation when the Commission took over, the long-range program undertaken to expand and assure supply from both foreign and domestic sources, and an inquiry into the domestic programs that have been pushed forward on exploring and pricing and processing; also the development of programs for low-grade ore, the beneficiation of low-grade ores. This raw materials position, I suggest, could be described and appraised by, among other people, Dr. Donald H. McLaughlin, president of the Homestake Mining Co., who is the chairman of the Commission's Committee on Raw Materials and Mining.

As to feed materials: The chain of plants operated by the industrial contractors under the Manhattan District to make feed materials at the time the Commission took over was in need of physical improvement, process improvement, health improvement, in order to raise production, lower costs, assure continuity of production. The Commission has financed major improvements in several plants. There has been brought about the betterment of processes, the raising of yields, quality of product, and lowered costs. Details on this latter, the matter of costs, can be supplied—and they are referred to in general terms—in the Fifth Semiannual Report to the Congress. The critical deficiency in several special materials used in these processes has now been overcome.

As to plutonium production—the Hanford plant in early 1947, as the committee knows, was in need of major repairs, which could not be made until the causes of the trouble were diagnosed and methods of remedying them, technical methods of remedying them, were devised. The Commission and its contractor, the General Electric Co., have completed a major maintenance job without loss in production, have constructed spare and additional plant units, have overcome two major threats to the life of the plant itself, have increased the production rate to a new all-time high and decreased costs per unit of product, have developed plant procedures that bring about a major reduction in the feed materials required to produce a given amount of material. A major research, development, engineering, and construction program for the recovery of uranium from depleted material is well under way. The story of this plant, process improvement, and the results can be given, among other men, by Harry Winne, vice president of the General Electric Co., individuals in the DuPont Co., quite a number of distinguished engineers and business administrators.

As to the production of uranium 235—the Commission took over an efficient operation at Oak Ridge. The problem has been to expand production and cut costs. In the past 2 years the contractor, the Carbide & Carbon Chemicals Corp., with Commission aid and support, has brought about an outstanding increase in operating efficiency and a decrease in costs, and these details are available for executive session. A major maintenance program was accomplished without loss in production. A plant addition was designed to increase production at a percentage rate doubling the percent of increase in the capital cost required. How much this increase is, of course, is a classified fact. Added facilities for extending the degree of completion of product have been accomplished. There has been production and stock piling of an adequate supply of special operating materials. The progress in the uranium 235 program can be recounted by Dr. George Felbeck, vice president of the Carbide & Carbon Chemicals Corp., and by other individuals who have been consultants, experts, or who from the outside know the history and methods involved.

There are special features of this production program to which we hope this accounting of stewardship will extend. When the Commission took over, there was no centralized system of accounting for source and fissionable materials. Such a system has been set up. Dr. Manson Benedict of the Hydro Carbon Research Corp., would be able to explain the difficulties, the technical difficulties, that existed at that time, that were met, and the extent to which they have been overcome.

A radiation detection instrument industry has been developed with Commission aid. This has very great importance in terms of civil defense in the event of atomic warfare. Export control has been set up in accordance with the provisions of the act. An Advisory Committee for Equipment and Material Control, largely of business and industrial men, has been established. A large quantity of excess plant facilities has been disposed of.

As to the weapons program—and here again, I repeat, nothing I say here involves secret material—I refer you for a summary to pages 42 and 43 of the report to Congress.

The aspects to be accounted for would appear to be—

1. The stock-pile situation today in terms of potential military effectiveness and weapons production rates, as contrasted to the situation in previous years. This would be in executive session.

2. Improvement in the scientific stature of the Los Alamos Laboratory, the center of production of weapons, design, and production, since the Commission took over—this we believe can be taken care of in public hearing—rebuilding of physical plant as well as personnel strength, and establishing of outlying facilities, including Sandia and Eniwetok, the testing areas in the Marshall Islands in the Pacific. Dr. Mervin Kelly, director of Research of the Bell Telephone Laboratories, would be eminently qualified to report on this matter, as he has recently made an intensive survey, covering almost a month, of these matters.

3. The organization of the bomb-production program through expansion, dispersal, and duplication of capacity, and through the introduction of industrial management. Appraisal of the effectiveness of this could be made in open hearing without the disclosure of any information, and the details will be provided in closed hearing.

4. The development of the bomb from a “bread-board” model to a “service” weapon, referred to in the report, and the design and production of ancillary equipment for the Armed Forces.

5. Scientific improvements in weapons design, as indicated by the success of the Eniwetok tests and progress since that time, progress which is presently going on at a very encouraging rate.

6. Present research and development programs directed toward new types of weapons of improved reliability and deliverability.

Among the individuals who can make an appraisal, a general appraisal, of the progress in the last 2 years and the present status are Dr. James B. Conant, a member of the General Advisory Committee and president of Harvard; Dr. Norris E. Bradbury, present Director of the Los Alamos Laboratory; Carroll L. Tyler, Director of Los Alamos Operations Office; Malcolm Ferguson, president of Bendix Aircraft Corp.; Dr. Robert F. Bacher, chairman, division of physics, mathematics, and astronomy, California Institute of Technology; Mr. William Webster, Chairman, Military Liaison Committee; and Mr. Mervin Kelly, director of Bell Telephone Laboratories, to whom I referred.

As to the matter of security, a vital and crucial matter, this would break itself down into at least five aspects of security and perhaps more. These would be—

1. Plant protection—what it was in terms of fences, guards, badge system, and so on; what its defects were 2 years ago, what was done

about it, what it is today. It happens that we are proud of this effort and believe that an appraisal of it can be made and details provided in closed session.

2. Security of documents—the committee is aware of the hundreds of thousands of classified documents in this undertaking. We reported on the state of affairs we found when the Commission took over in a communication to the committee of July 21, read to the committee at a meeting on July 21, 1947. A report on the present status would be reassuring and relevant.

The CHAIRMAN. Is that declassified?

Mr. LILIENTHAL. That has been declassified. That letter has been declassified because of the conditions described in it being only of historic interest.

The CHAIRMAN. Do you have that with you?

Mr. LILIENTHAL. I have.

The CHAIRMAN. May I have it?

Mr. LILIENTHAL. Yes. To continue:

3. Question of personnel clearance.

4. The question of shipments of materials.

5. The question of accountability; where it was that the changes have been made, the changes that need yet to be made, and the technical difficulties. This requires a good deal of technical information to make clear.

There is the question of labor policies. The purpose of the Commission's labor policies has been to maintain continuity of vital production against stoppage and yet to preserve the American institution of collective bargaining. The policy has been to require not only that employees of contractors be investigated by the FBI and cleared, where they have access to restricted data, but that the national and international officers and supervisory individuals in unions must be of clear reliability.

This has led to a conflict with the United Electrical Workers, of which the committee has been informed, in which we requested information concerning nonemployees of the Commission or of its contractors; who are officers of the United Electrical Workers' organization. This information was refused, information relating to their reliability in terms of loyalty and other matters.

The Commission directed the General Electric Co. to sever connections at Schenectady with this organization. The problems presented here should be appraised. On the question of general labor policies there has been discussion with the committee and also a report by a special panel created by the President.

There is the matter of research. This committee is aware—I am afraid the country is not as aware as is the committee—that research in nuclear science is the basis for any national advance and progress, both in weapons and peacetime uses, and this depends upon trained men and costly machines, such as the 184-inch cyclotron at Berkeley, accelerations, and synchrotrons which have been and are being built to help solve mysteries in the field of nuclear forces.

Another item to be accounted for is the distribution of isotopes, which has been expanded enormously both in the United States and in shipments abroad. Tagged compounds are now being made available domestically, as well as new types of isotopes.

Work in laboratories and research centers is under way and is designed to increase, and is actually increasing, the uranium supply, finding new materials suitable for construction and shielding of power reactors for improving and developing materials and components for atomic weapons.

The national laboratories have been strengthened, and we believe a survey of this matter will make clear they have been expanded, the scientific and technical personnel increased, and the morale situation recovered from a very low point.

Unclassified research in nuclear physics and related sciences is being supported by direct contracts with universities on some 40 projects and by financing some 50 contracts with universities jointly with the Office of Naval Research.

The problems here—and these are extremely important to general public understanding and to the rendering of any such accounting as the charges made make necessary and relevant and appropriate and fair—can be summed up by such members of the General Advisory Committee as Dr. DuBridge, Dr. Oppenheimer, Dr. Conant, and such individuals as E. O. Lawrence, Arthur Compton of Washington University, Dr. Spedding of Iowa State, and many other individuals.

I want to say just a word about a report on biology and medicine because, where charges are made of mismanagement, grave charges of mismanagement and failures to accomplish good management, the question of the health record in a field in which dangers are involved, as here, is extremely relevant and important. The health record of the Manhattan District was unexcelled by any industry, and this record has continued.

These radiation hazards, both on-site and off-site, have been controlled. There have been only two deaths in the atomic energy program. These were in the Manhattan Engineer District days, although in the handling of radium up to 1941 a hundred persons out of a thousand workers were casualties, handling only 21½ pounds of this material; whereas, in this industry thousands of individuals were handling the equivalent of hundreds of thousands of pounds of radium.

The element beryllium is used extensively in this industry. It is highly poisonous and very tricky. The Commission has pioneered in research in beryllium, which has led to established safeguards for protection of workers. This is extremely relevant in determining quality of management.

Continued research has gone forward on standards limiting exposure of production workers involved in radiation exposure, and many other items in this field.

We suggest that among the individuals who should be consulted are persons whose names I recounted earlier.

I have only one other suggestion as to a general area, although there are many others, and that is the one relating to the development of power.

As the House Subcommittee on Appropriations indicated in its report recently, this ranks in terms of national defense as part of the first line of defense, along with weapons, as an important and consequential program, but it also has infinite possibilities for the future in peacetime applications.

The Commission's first attention had to go, as the rendering of this accounting will show, to shoring up the weapons and fissionable materials programs because this was our paramount obligation and nothing should stand in its way.

The reactor program and power development had to be developed from scratch. The wartime reactors, wartime piles, were solely for the production of atomic explosives. For the past few months it has been possible to turn to the reactor problem and put it increasingly under a head of steam.

During late 1948 and early 1949 a Reactor Development Division was set up with a distinguished gentleman in charge of it, Dr. Hafstad, and a program decided upon. On this the Commission has reported to the joint committee.

A Reactor Safeguard Committee, a very important committee indeed, has developed minimum standards for the safe location and operation of piles. This is a problem fraught with many difficulties. The program has unified efforts on development of reactors for driving ships and aircraft.

The Westinghouse Co. has been obtained as a contractor for Navy reactor work in addition to the General Electric Co. and the work at the Argonne Laboratory.

To carry this program through, action has been taken to establish a testing station at a remote site, to wit, in Idaho, in the Arco area, and to push development. All along the line a coordinated attack has been organized and should be reported upon on the problems that are basic to any and all types of power reactors, whether for ships, for central station operation, or for aircraft, such as problems of cooling, shielding, pumping, and so on.

There are a good many men who can throw light on the problems in the reactor program, and I would indicate among them Dr. Fermi, Dr. Zinn, Dr. Fisk of Harvard, Mr. William Shoupp of Westinghouse, and a number of gentlemen from General Electric, Addison M. Rothrock, Assistant Director of Aeronautical Research of the National Advisory Committee for Aeronautics.

Mr. Chairman, the Atomic Energy Commission, its staff, its employees, its contractors, both industrial and research, welcome this inquiry and look forward to it with confidence that it will be full, fair, sober, and will relate not only to inadequacies but also to the over-all general accomplishments and achievements, with particular emphasis on indicating the place from which we started and the progress that has been made. This, in any kind of audit of any kind of enterprise, would seem to be relevant.

The CHAIRMAN. Mr. Lilienthal, you have certainly outlined a lot of work for this committee. Apparently you have not read in the papers that Congress hopes to go home on August 1.

But the seriousness of it, in my view, demands that a thorough, complete, and above all, a fair investigation of the whole situation be made. Of course, the witnesses whom you have suggested should and will be called before the committee, but other witnesses also will be called before the committee, on the suggestion of any member of the committee, because obviously not only the witnesses whom you have suggested but also all who are qualified to give the committee light on the subject should, and will, be called.

Senator Hickenlooper.

Senator HICKENLOOPER. At this time, Mr. Chairman, I have no particular questions to ask because I, for some reason, did not get notice of this hearing until this morning shortly before 10 o'clock.

I do want to just make a statement, if I may, because I am somewhat involved in this matter. At the outset, I certainly agree with Chairman Lilienthal that this is not and must not be a matter of personalities, nor, by the same token, of generalities.

I call to the attention of the committee at this time that there are many extremely controversial statements made by Mr. Lilienthal this morning, which I believe will merit exhaustive inquiry on both sides. The inquiry, I think, is indicated, but I would like, Mr. Chairman, to clarify the issues. The issues are in administrative policies, not so much in the matter of quantum production.

The issues, as I have them in mind, are in the general trend and tenor of the progress of administration and policies which not only in the past but now, and, from an indication, in the future will mitigate one way or another on the future progress and development of this great new and unique operation in which the American people are so vitally interested.

I cannot, of course, canvass Mr. Lilienthal's statement this morning. I will have to take a look at it. I can say there are many things I can agree with in his statement. There are some substantial things with which I will eventually present violent disagreement to the committee in whatever manner the committee wants to receive it.

I did attempt this morning, just before 10 o'clock, to try to make a short statement here, which I hope will help to maintain the clarity of this issue, not the emotional end of bomb-making or things of that sort, the scientific end of the thing, but to clarify the real issues which I have in mind in a very short and, I am sure, quite unsatisfactory statement, because it is not long. I would like to read that at this time for the record, Mr. Chairman. It has reference to the text of Mr. Lilienthal's letter to you, Mr. Chairman, of yesterday, which I did not have the opportunity of reading in full until this morning.

I have read the text of Mr. Lilienthal's letter to Senator McMahon, chairman of the Joint Committee, as released yesterday evening, with respect to hearings on atomic energy matters.

The Joint Committee has been in continuous investigation and study of the atomic energy program and of the Commission's administration of it for the past 2 years. In fact, the Joint Committee under the leadership of Senator McMahon is at the present time involved in a vigorous investigation of the administration of the program, and I am confident that this investigation will continue in an orderly fashion. The chairman has so announced and certainly has indicated by his speedy action that he intends so to continue. I am of the opinion, however, that the chairman and the Joint Committee will fix the order of the inquiry and the subjects to be considered.

From the standpoint of actual production, the atomic energy program has gone forward due to the zeal and the loyalty of the scientific and technical personnel in charge of the various projects. The point of my objection is not to the activities of these people but to the administrative policies which the Commission under Mr. Lilienthal's guidance and influence has followed and continues to follow. These I believe to be harmful and not in the best interests of the continuing development of the basic programs outlined by Congress.

In Mr. Lilienthal's letter to Senator McMahon of yesterday and in his voluminous public statements he accepts the credit for any progress of the program. By the same token, therefore, responsibility and criticism for misdirected and misguided policies must be accepted by him.

I want to reemphasize that I have not in any degree impugned Mr. Lilienthal's personal honesty nor his personal patriotism to his country. I believe he is sincere in his beliefs and in his policies. It is with his policies and with a continuation of those policies that I sharply disagree.

Mr. Chairman, I merely want to suggest that it is extremely evident or it is very evident here that this matter will require a considerable length of time in developing the various points that the committee may be interested in. A vast amount—in fact, I believe all—of the evidence and the facts that are pertinent to this matter are now contained in the files of the Joint Committee. It will require an orderly examination of those and a presentation of the issues in order to get at the facts.

I believe this to be a matter of great vital interest to the American people, and I believe that it should be impartially and vigorously looked into, and I congratulate the chairman on the vigor and speed with which he is attempting to provide the forum and the means for such investigation; but at this time this morning manifestly I am not prepared to present in any orderly fashion any brief or evidence, but I shall be in a very few days, Mr. Chairman, at your convenience and at the convenience of the committee, and I would like to suggest, if I may, for your consideration the desirability of the Joint Committee, as soon as reasonably possible, having an executive meeting in which the order of this procedure could be determined and the general method of continuing an orderly inquiry in order to save time and to eliminate unnecessary and immaterial and extraneous matter coming into the matter of inquiry.

The CHAIRMAN. Mr. Durham?

Mr. DURHAM. I have no questions, Mr. Chairman.

The CHAIRMAN. Senator Vandenberg?

Senator VANDENBERG. Nothing at the moment.

The CHAIRMAN. Senator Connally?

Senator CONNALLY. I just want to make one observation. This hearing has been provoked, as I understand it, by some rather specific charges, and while it would be desirable at an appropriate time to review the whole program from the beginning, it seems to me our first attention ought to be to the matters that have been brought before us at this time.

To go back and start from the beginning, as outlined by Mr. Lilienthal, to go over the whole program, it would seem to me to tend to obscure the particular matters that Senator Hickenlooper and others have brought to the attention of the committee. It seems to me that those questions ought to be the first object of the investigation.

The CHAIRMAN. Senator Knowland?

Senator KNOWLAND. No questions.

The CHAIRMAN. Mr. Holifield?

Mr. HOLIFIELD. No questions.

The CHAIRMAN. Mr. Price.

Mr. PRICE. No questions.

The CHAIRMAN. Mr. Jackson?

Mr. JACKSON. No questions.

The CHAIRMAN. Mr. Elston?

Mr. ELSTON. I would like to ask Mr. Lilienthal: Have you ever overruled the recommendation of your security officer?

Mr. LILIENTHAL. By "you" you mean the Commission, I take it, Mr. Elston.

Mr. ELSTON. Yes.

Mr. LILIENTHAL. The Commission has in two cases, as I recall, so far as personnel security clearances are concerned, disagreed with the conclusion of its Director of Security. There may be other instances of which I am not presently aware.

The Commission has final responsibility and could not, of course, completely delegate it.

Mr. ELSTON. Was that with respect to the employment of personnel?

Mr. LILIENTHAL. The cases I have in mind—as I say, it could be that there are others—but the cases I have in mind, so far as I can recall the only ones, involve the clearance of the Director of the Bureau of Standards, Dr. E. U. Condon, and the clearance as president of the Oak Ridge Institute of Nuclear Studies of Doctor, now Senator, Frank B. Graham.

Mr. ELSTON. Did your security officer recommend against their employment?

Mr. LILIENTHAL. In the case of Senator Graham my recollection, Mr. Elston, is that the Director of Security at that time was Admiral Gingrich, now Chief of Staff to the Commanding Admiral of the Pacific Fleet, and he sent the file to the General Manager with the statement that in view of the information in this file, he was submitting it to the General Manager under the procedures that existed.

I am not clear whether Admiral Gingrich indicated an adverse report, but it was a matter that called for reference to the General Manager. The General Manager referred it to the Commission and the Commission rendered a decision, with which the committee has been supplied a copy.

The case of Dr. Condon, my recollection is not too clear, but it is that Admiral Gingrich, on the basis of the file, concluded that clearance for the Director of the Bureau of Standards for the work involved at the Bureau should not be granted, and the Commission took a different view.

In both of these cases the conclusion of the Members of the Commission was unanimous.

Mr. ELSTON. Was there any recommendation with respect to FBI examination of candidates for the fellowship program?

Mr. LILIENTHAL. I do not recall that there was, but in any case, in this situation the Commission made a broad policy decision based on the recommendation of the National Research Council, and I do not think the question arose in terms of individual personnel clearances.

Mr. ELSTON. You did begin to have FBI examinations made of candidates for the fellowship program, did you not, and then abandoned that policy?

Mr. LILIENTHAL. Where fellowship candidates were to have access to restricted data, secret information, they were fully investigated. Where fellowship candidates and those to receive awards were to work

in universities, were to study and do research work in universities where unclassified information only was available to them, the policy decision of the Commission was to follow the recommendations of the National Research Council and not to require a full FBI clearance.

At the time the awards were made my recollection is that the Federal Bureau of Investigation took the list of awards and sent what would be in effect a file check—that is to say, the information in their files at that time—on these individuals.

The Commission's policy on this matter, by reason of the clear and unmistakable expression of the views of the Congress in the hearings on appropriations and elsewhere, and on grounds of public policy, that this was not the desire of the Congress, has been with the voluntary approval of the Research Council and the National Academy of Sciences, changed, and an oath of allegiance and an oath that one is not a Communist and does not belong to an organization that advocates the overthrow of the Government is now requested. Letters to all the individuals who have been awarded fellowships have gone out from the National Research Council or are going out tonight, which carries with it the requirement of the taking of this oath.

Mr. ELSTON. Do you think a Communist is going to pay any attention to that oath?

Mr. LILIENTHAL. A real Communist would not. He would then be subjected, as in the case of any other individual taking a false oath, to investigation by the Department of Justice for violation of the law and an indictment for perjury and the penalties therefor.

Mr. ELSTON. What is the difference between a real Communist and an unreal Communist?

Mr. LILIENTHAL. I would say that there is no difference except that a man who professes to be a Communist obviously be unable to take this oath. On the face of it, he would at once be subject to penalties for perjury.

One who is a covert Communist—and these would appear to be the most dangerous kind—might take the oath thinking he would get away with it. This would be taken care of by the Department of Justice investigation as in the case of all other perjurers.

Mr. ELSTON. Sometime ago you indicated in your testimony before this committee that even though you knew one of the fellowship candidates was a Communist, you would accept him in the program if the National Research Council recommended him. Have you changed your position on that?

Mr. LILIENTHAL. The question was then hypothetical. It need not be hypothetical now. The National Research Council, as I was well aware, would not have insisted on that kind of a basis.

They have now accepted an amendment to their contract, and on this score there is no chance of such a situation developing. I was emphasizing at that time—I was reluctant to answer your hypothetical question and, at the same time, did not want to dodge it—that we place such importance on reaching agreement on these matters with the scientific community and its representatives, the National Academy of Sciences, that we wanted this to be handled by their changing their policy and their recommendation; they have done so, and this is now a settled matter.

The fact is now that, in the case of fellows, they are required to take the oath that is required of Government employees generally, and be subjected to the penalties for violation of the oath and to the investigations that pertain to Government employees.

Mr. ELSTON. Now, have you always taken matters up with this committee that you felt were of importance?

Mr. LILIENTHAL. The Commission, as I indicated in my statement, has taken very seriously and in extenso the provisions of the law about keeping the committee fully and currently informed. There are, of course, obviously tens of thousands of items that might fall within such terminology. We have sent hundreds of documents, communications, to the committee and have appeared before the committee or met with such members as were available at the moment on many occasions and covering the widest possible areas. Mr. Elston, as I believe you know.

Mr. ELSTON. Did you inform this committee of your purpose to set up the fellowship program?

Mr. LILIENTHAL. Yes, we did; and this was in the public report to Congress as well as in communications to the committee. We also informed the committee in response to a question contained in a letter from the then chairman of the committee, now its ranking minority member, Senator Hickenlooper, what the policy of the National Research Council was in respect to FBI investigations, and so on, of fellows in the nonsecret field.

Senator Hickenlooper raised serious objection to this. The Commission responded in a letter, I believe, of October 11, 1948, which is in an earlier record of these hearings, stating the views of the National Research Council and our own agreement therewith.

Mr. ELSTON. Do you consider the loss of uranium such as disappeared from the Argonne Laboratory a matter of importance?

Mr. LILIENTHAL. The loss of any material is important in this—

Mr. ELSTON. Did you take that matter up with this committee when the loss was discovered?

Mr. LILIENTHAL. A report was made to the committee as soon as it was clear that such a report would not in anywise affect the investigation then being carried on by the FBI. This was pursuant to a general informal understanding reached quite a while ago that in cases where the FBI was engaged in an investigation of violation and where their preference would be to wait until the investigation reached the stage where it might not be impeded by possible disclosures resulting in reporting except to the FBI.

Mr. ELSTON. The law requires you to keep the committee currently and fully informed. On what date did you notify this committee of the loss of the uranium at the Argonne Laboratory?

Mr. LILIENTHAL. I think the date was April 27.

Mr. ELSTON. What was the date the loss was discovered?

Mr. LILIENTHAL. The loss in the laboratory was discovered in February, the exact date I am not aware, but early in February, as I recall. It was not reported to the Washington office until, I believe, sometime in mid or perhaps the third week in March. My recollection of the exact date is not clear and I would like to straighten it out in the record.

(The following was later submitted for the record:)

The loss was discovered on February 7. It was reported to the Washington office on March 28 by letter dated March 25.

Mr. ELSTON. When was the first time you personally knew of it?

Mr. LILIENTHAL. The matter was first reported to the Commission on April 13. I was absent, at Hanford and the west coast, from the meeting on April 20 at the time it was fully discussed.

Mr. ELSTON. Mr. Chairman, I have some other questions I want to ask later. At this time that is all I care to ask.

The CHAIRMAN. Mr. Van Zandt?

Mr. VAN ZANDT. No questions.

The CHAIRMAN. Mr. Hinshaw?

Mr. HINSHAW. No questions.

Senator HICKENLOOPER. Mr. Chairman, I did not want to go into this matter, and I do not like to raise this issue at the present time. I am not raising it as a matter of personalities, but the name of Dr. Graham was brought into this matter.

It is my understanding, Mr. Lilienthal, that you personally appeared before the Roberts Board, after they had told you what they thought their finding would be, and withdrew the consideration of the Graham matter from the Roberts Board and that thereafter the Commission acted; is that correct? So that it was not a matter of the General Manager's operation?

Mr. LILIENTHAL. The General Manager did express his view and make his conclusion and then he, without referring to the Commission, referred it to the Roberts Board.

I should answer the question, if the committee thinks it should be answered, after making this statement—that is to say, in open session:

It is evident that the relations of the Commission with its advisory bodies of citizens, voluntarily serving and sometimes in onerous capacities, is involved in discussing proceedings which they conduct rather than our own proceedings. The discussion at that hearing was reported in their minutes, and those minutes were reported to the committee, and Senator Hickenlooper and others have seen those minutes. So that the committee has the information.

I only raise the question, Senator: Whether in view of the fact that this would, presumably, require or might require that members of the Roberts Board appear here, whether you would not prefer to have this discussed in executive session. I have no reluctance in saying what the facts were.

Senator HICKENLOOPER. I do not want to request any statement that should be discussed in executive session. I understood the response to Mr. Elston was that this matter was handled by the General Manager, and I merely asked the question as to whether or not you did not appear personally before the Roberts Board and withdraw the Graham file from their consideration.

Mr. LILIENTHAL. Let me answer that question.

Senator HICKENLOOPER. If that is a matter which should be discussed in executive session, I shan't press it.

The CHAIRMAN. Mr. Durham?

Mr. DURHAM. Mr. Chairman, due to the fact that this involves a Member of the Senate, I think if you are going to discuss this any further, we should have him here.

Senator HICKENLOOPER. Mr. Chairman, I am not raising any issue on Dr. Graham one way or the other. That is not the point. It was the mechanics of the answer which was given that I wanted to get cleared, if possible.

I am not raising any issue as to a member of the Senate or Dr. Graham or anything else about any merits or demerits. That is beyond the issue raised in this case entirely.

Mr. LILIENTHAL. I think I can answer the question that has been asked without going into the merits of the matter or the discussions in the committee or with the Roberts Board in this fashion.

The CHAIRMAN. I think this, Mr. Lilienthal: Senator Graham is a Member of the Senate. If his name is going to be discussed or his case is going to be discussed in any way, Senator Graham should have the courtesy of being notified and being present, whether it is in an open hearing or executive session.

Senator HICKENLOOPER. Mr. Chairman, I again want to make clear that I have no intention now or in the future of discussing Dr. Graham's case. I am not going to bring on any discussion of the merits or demerits of this controversy.

Mr. HOLIFIELD. That is what we are doing, Senator.

Senator HICKENLOOPER. I was trying to clear up a statement made in the record. I merely wanted to get the facts.

Mr. HOLIFIELD. I do not see how you can do it with this line of questioning. I think if Senator Graham's name was brought into the hearing, he should be present.

Senator HICKENLOOPER. I am perfectly willing to, but I have no intention of going into any matter of his personally.

Mr. LILIENTHAL. Might I comment to this extent, to make it clear that the minutes of the meeting to which Senator Hickenlooper referred are minutes made by the Secretary of the Roberts Board, not by the Commission, indicating what transpired at that meeting, and those minutes have been examined by this committee and are in your possession and you are aware of what did transpire.

I just want to make it clear that there is no disposition on our part to fail to disclose anything about the proceedings.

The CHAIRMAN. That will have to be discussed by the committee and suitable arrangements made, whether in open session or in executive session, but certainly in Senator Graham's presence.

Are there any other questions, gentlemen? If there are no other questions from Mr. Lilienthal, Commissioner Strauss and Commissioner Pike are present. Have they any statement to make at this time?

Commissioner STRAUSS. I have none, Mr. Chairman.

Commissioner PIKE. I have none, Mr. Chairman.

The CHAIRMAN. I will not ask Commissioner Dean for a statement on the matter inasmuch as he was sworn in yesterday or the day before yesterday. It would appear this is as far as we can go at this session this morning. The chairman will call an executive meeting for discussion of future and further proceedings in this matter.

Mr. LILIENTHAL. May I make one comment? I would like to express my personal appreciation to Senator Hickenlooper for what he said about not having intended to raise any question about patriotism or honesty or sincerity and to say that I had no idea he had done so; there was nothing in his statement that implied any reflection on me individually but rather on the policies and management for which I was in part responsible.

Senator HICKENLOOPER. May I say in response to that, Mr. Chairman, that the reason I have on several occasions stated that I do not question Mr. Lilienthal's patriotism nor do I question his personal honesty—unfortunately, I have received two or three communications from people whom I do not believe know too much about this matter, indicating that there might be some question raised about patriotism, as people will raise some of those questions, and I want to make it abundantly clear and I shall reiterate that is not only not an issue, but I raise no question about patriotism or personal honesty. It is not an issue in this matter, as far as I am concerned.

(Whereupon, at 11:45 a. m., the Joint Committee adjourned.)

## JOINT COMMITTEE ON ATOMIC ENERGY

(Created pursuant to Public Law 585, 79th Congress)

BRIEN McMAHON, Connecticut, *Chairman*

CARL T. DURHAM, North Carolina, *Vice Chairman*

RICHARD B. RUSSELL, Georgia

EDWIN C. JOHNSON, Colorado

TOM CONNALLY, Texas

MILLARD E. TYDINGS, Maryland

BOURKE B. HICKENLOOPER, Iowa

ARTHUR H. VANDENBERG, Michigan

EUGENE D. MILLIKIN, Colorado

WILLIAM F. KNOWLAND, California

CHET HOLIFIELD, California

MELVIN PRICE, Illinois

PAUL J. KILDAY, Texas

HENRY M. JACKSON, Washington

W. STERLING COLE, New York

CHARLES H. ELSTON, Ohio

CARL HINSHAW, California

JAMES E. VAN ZANDT, Pennsylvania

WILLIAM L. BORDEN, *Executive Director*

HAROLD BERGMAN, *Deputy Director*

WILLIAM J. BERGIN, *Editor*

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

WEDNESDAY, JUNE 1, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to notice, at 10:05 a. m., in the caucus room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman), presiding.

Present: Senator McMahon (chairman), Representative Durham (vice chairman), Senators Russell, Connally, Tydings, Hickenlooper, Vandenberg, Millikin, Knowland; Representatives Holifield, Price, Kilday, Jackson, Cole, and Elston.

Also present: Senator Owen Brewster, Senator Charles W. Tobey, Senator Edward J. Thye, and Senator J. Allen Frear, Jr.

David E. Lilienthal, Chairman, Atomic Energy Commission.

Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Walter J. Williams, Director, Division of Production; Brig. Gen. James McCormack, Jr., Director, Division of Military Application; Lawrence R. Hafstad, Director, Division of Reactor Development; Dr. Shields Warren, Director, Division of Biology and Medicine; Kenneth S. Pitzer, Director, Division of Research; Paul M. Green, Director, Division of Finance; Morse Salisbury, Director, Division of Public and Technical Information; and Francis Hammack, Acting Director of Security, of the Atomic Energy Commission.

The CHAIRMAN. The meeting will come to order.

Mr. Lilienthal, would you take the stand, please.

Senator Hickenlooper, a member of the committee and formerly its chairman, has charged Mr. Lilienthal and the Atomic Energy Commission with incredible mismanagement.

Mr. Lilienthal, Chairman of the Atomic Energy Commission, has replied that the Nation's project is not incredibly mismanaged, that, on the contrary, the Commission's record is a proud one.

The issue is one which goes to the heart of our national defense.

The responsibility of the Joint Committee on Atomic Energy to Congress and to the people is now direct and immediate.

The purpose of the hearings which begin today is to get at the truth.

The American people can feel confident that a fair opportunity will be furnished here (within the limits of security) to throw a searchlight on the facts.

If the facts are such as to alarm our people, then they ought to be alarmed. If the facts are such as to reassure our people, let them be

reassured. We must be thorough. We must be just. There must be no persecution and no whitewash.

When the hearings are completed, the Joint Committee will report to the American people. This committee, as the responsible representative of Congress and the people, is obligated to render its judgment. Senator Hickenlooper?

Senator HICKENLOOPER. Mr. Chairman, because of the extreme importance of these hearings, it is imperative that I clarify the issues at the outset. My charges made public on May 22, 1949, and upon which these hearings are based, go solely and entirely to the question of the administrative competency of Mr. Lilienthal as Chairman of the Atomic Energy Commission. I shall produce the proof before this committee. This committee and the American public will be the judge.

It must be clearly understood beyond all question that this is not an evaluation of the Manhattan District; nor is it a comparison between the Manhattan District and the Atomic Energy Commission. The Manhattan District has been out of existence for 2 years and 5 months.

This is not and must not become a dispute between the theories of civilian as against military control. The Atomic Energy Act has established civilian control of atomic energy. That issue is, therefore, not involved in any way. I have continuously supported the principle of civilian control.

This is not, in my view, an inquiry into the production of atomic materials by the major operating contractors, all of whom have had historic connection with the program. I do not intend to inject into this hearing the matter of the scientific or technical operations involved in production.

This is an inquiry into the administrative direction and policies of Mr. Lilienthal as Chairman of the Commission itself. I will resist the attempt of anyone to divert this inquiry by beclouding the issues or introducing extraneous matters.

It must be borne in mind that the Commission does not operate as a producer of materials or directly engage in research. Those things are done through operating contractors. The Commission is charged with the over-all administration and policy direction of this great and unique enterprise.

When news of the atomic bomb first stunned the world, our Nation sought for the best means to control what we had, to advance atomic development, and to maintain our preeminence. After intensive study and exhaustive advice from among the ablest scientists, technicians, industrialists, economists, lawyers, government officials (both military and civilian), and many others, the Atomic Energy Act of 1946, authored by the distinguished chairman of this committee who was then chairman of the Senate Special Committee, was enacted. Together with the chairman and six other members of this committee, I was privileged to be a member of that Special Committee. It wrote the atomic energy program of the United States. The chairman of this committee, Senator McMahon, can take great pride in this act.

The peace of the world and the future of our civilization depend upon the degree of fidelity, integrity, and confidence maintained in

this program. The Congress and the American people consented to the setting up of the greatest Government monopoly in the history of this country. The program is clothed in secrecy, and many phases of it must necessarily remain secret. The law placed vast power and authority in the discretion of the Chairman and the members of the Atomic Energy Commission. In the appropriations of money for this activity, the veil of secrecy has hung and in some cases must hang between the Appropriations Committee and the details of the projects for which they are appropriating money. Such an atmosphere prevents current public checking of most of the policies of the Commission and establishes a climate within which errors and misdirection of human judgment can flourish without detection or restraint.

The Joint Committee on Atomic Energy was established by law to create an arm of the Congress which would constantly study this program and its development. I am certain the Congress has faith and confidence in the zeal of the Joint Committee and in its attention to this unique and new project. In this representative government of ours and under the law the Joint Committee on Atomic Energy constitutes the only real check on the operation of this strange governmental monopoly. The Atomic Energy Commission represents bureaucracy in its most perfect form. With power almost unlimited, it clothes itself with secrecy as it writes and enforces the rules of its own game.

I supported Mr. Lilienthal at the time of his confirmation in the Senate. The transition from military to civilian control had to be made. The program needed direction. Mr. Lilienthal was appointed by the President of the United States. He was a controversial figure then, as now. Long and exhaustive hearings were held which, in my opinion, failed to produce evidence to seriously challenge Mr. Lilienthal's integrity or his competence. An imposing array of witnesses testified as to Mr. Lilienthal's administrative ability in the TVA. These were sincere men. I believed them. On the basis of this testimony and the lack of adverse information I voted for Mr. Lilienthal in the committee and supported him on the floor.

For the past two and a half years I have observed Mr. Lilienthal's administrative actions and have been forced to conclude that regardless of his record at TVA he is inadequate in his present position.

It is an untenable belief to maintain that the administration of the Atomic Energy Commission differs fundamentally from the administration of other large enterprises. To accept that belief would have automatically disqualified any applicant for the position as administrator, for the program was entirely new. Barely three short years ago Mr. Lilienthal was introduced to the subject of atomic energy. He was given his present position not because of any scientific or technical ability but on the basis of his record as an administrator. To be sure the problems which he has faced in the Atomic Energy Commission differ from those which are faced by other Government administrators, but it must be emphasized that these differences are mostly differences of degree and not kind. If Mr. Lilienthal made administrative mistakes in TVA only our domestic economy would have been involved. Mistakes or misdirection of policy in the Atomic Energy Commission, however, can cost us our preeminence in the atomic field.

As the appointed Chairman of the Atomic Energy Commission, Lilienthal is responsible for administrative policies respecting personnel, labor-management relations, security, finance, program planning, and so forth. It is my contention that the Atomic Energy Commission must have the best obtainable administration. Nothing short of the maximum achievement is acceptable.

Now, Mr. Chairman, I shall proceed, but first I would like, so that there will not be any delay about this, to request the delivery to me for examination and for the records that they contain, the following list of documents, information, and records, and it is extremely important that I have them by 5 o'clock this evening.

First, I would like to request from the Commission that they deliver all correspondence and recommendations regarding the question of the custody of atomic weapons.

Second, copies of all reports of all of the Commission's advisory committees together with the status of their recommendations.

Third, the record of all overtime pay to the Washington headquarters personnel of the Atomic Energy Commission.

Fourth, the minutes, progress reports, and recommendations of the General Advisory Committee.

Fifth, the minutes, progress reports, and recommendations of the Military Liaison Committee.

Sixth, the minutes of the Atomic Energy Commission.

Seventh, the security files and local board hearings on the following persons: I shall not make public the names of these persons, but I have a list of the persons whose security files and the results of the local board hearings I request, and I shall pass these to Mr. Lilienthal. I do not want to make them public.

Mr. Chairman, you may open it and look at it.

The CHAIRMAN. Yes.

Eighth, I would like delivered to me for examination, for the benefit of the committee (a) the Quebec Agreement, which needs no further amplification; (b) the Hyde Park Aide Memoire; (c) memoranda relative to atomic energy and the Potsdam Conference; (d) the paper stating the position of the United States and the United Kingdom of January 1948.

Ninth, the inventory turned over to the Atomic Energy Commission by the Manhattan District at the time of the transfer.

Tenth, all reports (including correspondence with the FBI) relative to lost or misplaced fissionable or source material, whether recovered or still missing.

Eleventh, the engineering reports on the reactor sites.

Twelfth, the reports of investigation of all fellows participating in the fellowship program.

Now, Mr. Chairman, because I want to talk about administrative matters this morning, and because I want to go through some matters of personnel, I want to make it clear at the outset that I have no intention of attempting to cross-examine Mr. Lilienthal this morning.

I do not consider that he is, necessarily, here as a witness except as he may care to comment on matters as they go through, and I would like to start with the organization personnel because I believe a fundamental task of administrative competence is deeply involved in the continuity of personnel and in the selection of able personnel.

So, if I may proceed, Mr. Chairman.

**STATEMENT OF DAVID E. LILIENTHAL, CHAIRMAN, ATOMIC ENERGY COMMISSION; ACCOMPANIED BY CARROLL L. WILSON, GENERAL MANAGER, AND JOSEPH VOLPE, JR., GENERAL COUNSEL, ATOMIC ENERGY COMMISSION**

Senator HICKENLOOPER. Mr. Lilienthal, you are acquainted with Herbert Marks, are you not?

Mr. LILIENTHAL. Yes.

Senator HICKENLOOPER. He was the first General Counsel of the Atomic Energy Commission, was he not?

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. Is the office of General Counsel considered an important and a vital office in the Commission?

Mr. LILIENTHAL. It is.

Senator HICKENLOOPER. How long did Mr. Marks stay as General Counsel to the Commission?

Mr. LILIENTHAL. I have forgotten the exact period. My recollection is that it was a couple of years, but I can supply that for the record.

Senator HICKENLOOPER. Well, the Commission has been in operation now about 2 years and 5 months.

Mr. LILIENTHAL. The figure that has been supplied me is that Mr. Marks was General Counsel between October of 1946 and December of 1947, a period of—

Senator HICKENLOOPER. He has now left the Commission as General Counsel?

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. He had originally served in TVA when you were there; had he not?

Mr. LILIENTHAL. Yes, he had.

Senator HICKENLOOPER. Then, I believe, he served in the Bonneville district?

Mr. LILIENTHAL. That is correct. He was general counsel to the Bonneville administration.

Senator HICKENLOOPER. Yes. Then he came from the State Department to the Atomic Energy Commission; did he not?

Mr. LILIENTHAL. Yes. I believe he was an assistant or one of the assistants to the then Under Secretary of State, Mr. Acheson; yes.

Senator HICKENLOOPER. Do you know what he is doing now?

Mr. LILIENTHAL. He is in the private practice of law in Washington.

Senator HICKENLOOPER. Do you know whether he is a consultant to the State Department or to the Economic Cooperation Administration?

Mr. LILIENTHAL. No; I do not.

Senator HICKENLOOPER. Do you know whether or not he spent some time in Paris last summer as a consultant there?

Mr. LILIENTHAL. No; I do not know.

Senator HICKENLOOPER. How long did it take to replace him? Do you care to comment on that?

Mr. LILIENTHAL. I would say a matter of a couple of months, is my recollection.

Senator HICKENLOOPER. Do you consider that Mr. Marks' leaving the program was a loss to the Commission? -

Mr. LILIENTHAL. Yes, I do. He is an able lawyer.

Senator HICKENLOOPER. You are acquainted with Edwin Huddleson, are you not?

Mr. LILIENTHAL. Yes, I am.

Senator HICKENLOOPER. He was Assistant General Counsel at one time, was he not?

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. Did he come from Government or——

Mr. LILIENTHAL. I believe he came directly to the Commission from Government.

Senator HICKENLOOPER. And he terminated his connection with the Commission, did he not, some time ago?

Mr. LILIENTHAL. Yes. He was offered a partnership in a San Francisco law firm, that being his home city, and he accepted it and resigned some months ago.

Senator HICKENLOOPER. Did you consider him an able man?

Mr. LILIENTHAL. Yes, indeed.

Senator HICKENLOOPER. And you considered his leaving the Commission a loss to the Commission?

Mr. LILIENTHAL. Yes, sir.

Senator HICKENLOOPER. Then, your next General Counsel was Mr. Adrian Fisher?

Mr. LILIENTHAL. That is correct; yes, sir.

Senator HICKENLOOPER. And do you recall offhand when Mr. Fisher took up his duties as General Counsel?

Mr. LILIENTHAL. February 1948.

Senator HICKENLOOPER. That was February of last year?

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. And he came from the Department of Commerce, did he not?

Mr. LILIENTHAL. Yes, he was at that time Solicitor of the Department.

Senator HICKENLOOPER. And was appointed by Mr. Henry Wallace, I believe, as attorney or counsel in the Department of Commerce?

Mr. LILIENTHAL. My recollection is that he was appointed by Secretary Harriman, but I could be mistaken.

Senator HICKENLOOPER. I see.

Now, Mr. Fisher has left as General Counsel, has he not?

Mr. LILIENTHAL. Yes. Mr. Fisher has just been appointed by the President for the post of Legal Advisor to the Department of State.

Senator HICKENLOOPER. Incidentally, he is getting approximately the same salary there as he got under the Commission, is he not?

Mr. LILIENTHAL. I am not aware about that; perhaps that is the case.

Senator HICKENLOOPER. Do you consider Mr. Fisher a good man?

Mr. LILIENTHAL. A very able man.

Senator HICKENLOOPER. And you consider that his leaving was a loss to the Commission?

Mr. LILIENTHAL. Yes; I do indeed, and this loss was pointed out to the Under Secretary of State when conversations about the availability of Mr. Fisher were begun.

I regard him as one of the ablest young lawyers in the country.

Senator HICKENLOOPER. Yes.

Now, have you replaced Mr. Fisher?

Mr. LILIENTHAL. Yes. The Commission has appointed Mr. Fisher's deputy, the Associate General Counsel, Mr. Joseph Volpe, Jr., as General Counsel.

Senator HICKENLOOPER. So that Mr. Volpe has now been appointed General Counsel of the Commission?

Mr. LILIENTHAL. Yes.

Senator HICKENLOOPER. The point that I am indicating there is that there has been lack of continuity in the General Counsel's office. I think that is indicated there.

Now, the Director of Organization and Personnel, do you consider that an important office?

Mr. LILIENTHAL. It is.

Senator HICKENLOOPER. Are you acquainted with Mr. Lyle Belsley?

Mr. LILIENTHAL. Yes, I am.

Senator HICKENLOOPER. I believe he was the first Director of Organization and Personnel, was he not?

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. Do you know where he came from, that is, what his previous employment was? Did you track it down?

Mr. LILIENTHAL. He is, I think, a Government career man. Where he came from directly to the Commission, at the moment I do not recall.

Senator HICKENLOOPER. Do you know when he terminated his services in that capacity?

Mr. LILIENTHAL. September 1947. At that time he was, I believe, Secretary to the Commission. At that time his post was that of Secretary to the Commission.

Senator HICKENLOOPER. So he did go from Director of Organization and Personnel to the post of Secretary to the Commission?

Mr. LILIENTHAL. Yes. I think professionally he had both experience as a personnel man, personnel management man, and in other capacities of this character.

Senator HICKENLOOPER. Yes. Now, do you consider his separation as the Director of Organization and Personnel as a loss to the Atomic Energy Commission in that capacity?

Mr. LILIENTHAL. Mr. Belsley was an able man, but I felt at the time there were talents superior to those he had for the kind of work that the secretaryship requires, and I think that the present Secretary, Mr. Roy Snapp, his experience and talents are superior to those of Mr. Belsley for that particular purpose.

Senator HICKENLOOPER. But I was not talking about the Secretary so much as the Director of Organization and Personnel, in that capacity.

Mr. LILIENTHAL. Well, I was of the opinion that—I am of the opinion that Mr. Waller is an abler man for personnel work. This is not intended as a reflection on Mr. Belsley. These are matters of judgment as to comparative value.

Senator HICKENLOOPER. Do you know Mr. Arthur Tackman?

Mr. LILIENTHAL. Yes, I do; rather slightly, but I do.

Senator HICKENLOOPER. He was assistant to the Director of Organization and Personnel in the Washington headquarters, was he not?

Mr. LILIENTHAL. He was an assistant, yes.

Senator HICKENLOOPER. He separated or was separated from that position in that department, is that correct?

Mr. LILIENTHAL. It is my understanding he did resign.

Senator HICKENLOOPER. Do you know what his history or background was?

Mr. LILIENTHAL. I do not have it in mind at the time, no. I think he was in personnel work; that is my recollection of it.

Senator HICKENLOOPER. Do you recall the reasons for his separation?

Mr. LILIENTHAL. No, this was a management matter, and I was informed of it, but I do not have the reasons. I think he went with the Economic Recovery Administration, but I am not clear about it.

(The following was later submitted for the record:)

The agency to which Mr. Tackman went is the Office of the Secretary of Defense.

Senator HICKENLOOPER. I see.

Would you have any opinion as to whether or not he was a loss to the Atomic Energy Commission?

Mr. LILIENTHAL. The opinion of him, of his quality that I heard reported to me by the management, was always high and satisfactory and, therefore, I would assume that this was a loss.

Senator HICKENLOOPER. You are acquainted with Mr. Eric Nicol, are you not?

Mr. LILIENTHAL. Yes, I was.

Senator HICKENLOOPER. He became the second Director of Organization and Personnel in the Washington headquarters, did he not?

Mr. LILIENTHAL. That is correct, sir.

Senator HICKENLOOPER. Do you recall where he came from? When I say "where did he come from," I mean his background.

Mr. LILIENTHAL. Yes. His immediate employment prior to the coming to the Commission, as I recall, was with the Rexall Drug system, and his office, I believe, was located in Pasadena or Los Angeles or some place on the west coast. He was in private business at the time he came to the Commission.

Senator HICKENLOOPER. Do you consider him an able man?

Mr. LILIENTHAL. Yes, I thought he had a good background of experience in personnel matters.

Senator HICKENLOOPER. Do you know what his occupation is now?

Mr. LILIENTHAL. No, I do not. I understood that he had returned to private employment. I am advised that he has returned to private industry.

Senator HICKENLOOPER. I see.

Do you consider that his return to private industry was a definite loss to the organization at the time?

Mr. LILIENTHAL. I think that Mr. Nicol had qualities of understanding about personnel matters derived from his experience that were very helpful to the Atomic Energy Commission, and had he been able to afford to remain, for I am told that the salary limitation which the Atomic Energy Commission must comply with, and which presented great difficulties for him, that he would have developed into a great asset.

He was not with us long enough to make a final judgment, but our opinion was—and this was an opinion transmitted to your committee,

to the committee at the time that you were its chairman—that his work showed considerable ability.

Senator HICKENLOOPER. He was aware of the salary at the time he came to work for the Commission, was he not?

Mr. LILIENTHAL. Yes, he was. He also indicated that there was a good deal of discussion at that time that Government salaries, Government salary scales, would be improved for a man of his background and experience, and that the chance was such a good one, that he took that risk. That did not turn out to be the case, and has not turned out to be the case as of today.

Senator HICKENLOOPER. Yes. So there has been considerable shift and movement and lack of continuity in the office of the Director of Organization and Personnel, Mr. Chairman. I want to indicate that.

Getting into the office of Director of Security and Intelligence, do you consider that an important post in the Commission?

Mr. LILIENTHAL. Yes, very.

Senator HICKENLOOPER. It is a very vital office, is it not?

Mr. LILIENTHAL. It is indeed.

Senator HICKENLOOPER. And probably as highly important an office, subject to the General Manager and the Commission's policy decisions, as there is in the Commission, is that about correct?

Mr. LILIENTHAL. No, I would not say that. I would say that I would think it was a very important and very vital office. I would think that in production and other matters, they might be more important, but it is a vital area indeed.

Senator HICKENLOOPER. Well, just to clarify this, may I ask you, do you consider that the question of personnel security is secondary to other matters in the Commission's operation?

Mr. LILIENTHAL. Well, I would not use the term "secondary." I think it is a very important consideration. That of getting people and getting work done, getting production, getting atomic weapons, these are more important still.

This does not mean that the Director of Security's position is not terribly important, but if that is the only field in which we are strong, we obviously will not be strong in atomic weapons or atomic development. That is all I had in mind.

Senator HICKENLOOPER. Then, I take it that you do consider if it were a question between production and the security and safeguarding of personnel, you would put production as more important?

Mr. LILIENTHAL. I do not regard that as the alternative, Senator. I just think that is a hypothetical situation. These are on all fronts, these things are important, and they must all go together.

Senator HICKENLOOPER. I shall not press you on that point.

Now, who was the first Director of Security and Intelligence that you had, as such, that is not an acting director, but the first director?

Mr. LILIENTHAL. Admiral John Gingrich of the United States Navy.

Senator HICKENLOOPER. Now, do you recall approximately when he entered upon that office?

Mr. LILIENTHAL. I was advised it was August 1947, less than 2 years ago.

Senator HICKENLOOPER. And the Commission formally took office on January 1, 1947; is that correct?

Mr. LILIENTHAL. Well, the transfer of the Manhattan project was made on that date; yes, sir.

Senator HICKENLOOPER. And the Commission had been appointed and had been ordered to cooperate prior to that time—the official transfer took place on January 1, 1947?

Mr. LILIENTHAL. Yes. The Commission spent—did not have a great deal of time to engage in its work until the middle of April of that year, however.

Senator HICKENLOOPER. Yes, I recall the circumstances.

So that for practically the first 8 or 9 months of the Commission there was no Director of Security and Intelligence, except, perhaps, an acting director.

Mr. LILIENTHAL. There was an acting director, Mr. Thomas Jones, who had been with the Manhattan project as a security officer.

Senator HICKENLOOPER. Was Admiral Gingrich a security specialist?

Mr. LILIENTHAL. No.

Senator HICKENLOOPER. Do you know whether he had any experience in security, such as the operation of the security department at all?

Mr. LILIENTHAL. He had had a good deal of experience in dealing with scientific matters, which were matters involved in security, and had a lot of experience with people, which is an important part of a security officer's judgment, because it is mostly judgment.

As I recall, on behalf of Secretary Forrestal, the late Secretary Forrestal, he was in charge of the reserve program in the——

Senator HICKENLOOPER. Do you know whether he had any previous experience, that is of any degree at all, with subversive movements in this country or the history of subversive activities, or whether he had any training in order to be able to detect the subtle activities of the subversives?

Mr. LILIENTHAL. I am not aware that he had.

Senator HICKENLOOPER. Prior to his appointment did you ask the FBI for experienced men along this line?

Mr. LILIENTHAL. Yes. We discussed——

Senator HICKENLOOPER. That is, who might be available to take over the important security department of the Commission?

Mr. LILIENTHAL. Yes. It is the word "available" that produces the difficulty. A number of individuals were spoken highly of by the FBI. One of them, and if I may refer to two of these examples—both of these were former FBI special agents, I believe they were called, perhaps regional agents; one is now and was then the personnel director of the Ford Motor Co., Mr. Bugas.

We spent a good deal of time trying to persuade Mr. Bugas that he should render at least a couple of years' service in this important position. We were completely unable to persuade him to do so.

Then, as another example of individuals who were highly spoken of by the FBI in our consultation with them, there was a man, a former FBI agent, whose name is Whitley, now a practicing lawyer in Florida.

He was brought up here; we got on our knees to him; we did everything we knew to persuade him to give up what he was doing and to take that post, but again we were unsuccessful.

There were other instances, Senator. I do not have them on the top of my mind.

Senator HICKENLOOPER. Do you consider the FBI probably the most experienced investigative agency in the United States, with a

familiarity with subversive methods and subversive individuals in this country?

Mr. LILIENTHAL. Yes.

Senator HICKENLOOPER. Do I understand then that with all the thousands of men who had been trained by the FBI you were unable to locate one, either from that agency or one highly trained by that agency, to take over this vital job?

Mr. LILIENTHAL. We were unable to persuade any of these individuals who had all the qualities required for this post to take over this job; that is right.

Senator HICKENLOOPER. So then, you selected a man who had no qualifications for the job?

Mr. PRICE. Mr. Chairman, I would like to ask a question at this point.

Mr. Lilienthal, was Admiral Gingrich your choice?

Mr. LILIENTHAL. No, he was not, although I was very pleased with the selection. He was suggested to us, and I believe it was a good suggestion, by Admiral Strauss, a member of the Commission.

Mr. PRICE. You have a five-man Commission, do you not, Mr. Lilienthal?

Mr. LILIENTHAL. Yes, Representative Price.

Mr. PRICE. I would like to ask the Senator from Iowa, are your charges directed against the five-man Commission or are they directed against Mr. Lilienthal?

Senator HICKENLOOPER. Mr. Chairman, as I said yesterday, it is going to be essential for me to present my matters in an orderly fashion. I shall unfold them, and the evidence will be developed.

Mr. PRICE. I think we could save some time if we knew whether your charges were directed against an individual or against the Commission.

The CHAIRMAN. The Senator from Iowa is asked whether he would care to answer the Congressman as to whether he is proceeding against Mr. Lilienthal in personam or the Commission in rem.

Senator HICKENLOOPER. My criticism goes to Mr. Lilienthal as Chairman of the Commission. Matters with respect to the general Commission can be discussed at a later date.

Mr. PRICE. Mr. Lilienthal, you make the administrative decision on the basis of the action of the Commission, do you not?

Mr. LILIENTHAL. Actually, Representative Price, the statute provides that management matters may be delegated to a General Manager, as provided by law, appointed by the President, not by the Commission, and confirmed by the Senate; and the Commission, not its Chairman, is the governing body of this enterprise, and this is not only the situation as required by law, but this has been the situation in fact, as I hope, before long we may describe in extenso. There is no power delegated by law to the Chairman to act apart from the Commission.

Senator HICKENLOOPER. Mr. Chairman, inasmuch as I am involved in this matter, and I have some responsibility to present these matters in an orderly fashion, and inasmuch as I discussed this matter with the committee yesterday, I hope that I can get through as expeditiously as possible, and I certainly think that every member of the committee thereafter will have all of the opportunity and right to ask questions that occur to them. But I would appreciate the

courtesy of being allowed to pursue my matters in continuity so that the matters can be before the committee; and certainly, I will thereafter not only not object, but I shall believe it is the perfect right of any member to ask questions; but I would appreciate the opportunity of proceeding.

Mr. PRICE. I am glad that the Senator makes the concession that it is the right of the other members to ask questions.

The CHAIRMAN. All right, gentlemen, we will proceed, at least until the noon recess.

I rather imagine that Senator Hickenlooper is not going to run out of material before we recess, but if any member of the committee wishes to take up any particular matter or procedure, I suggest that we have an executive session of the committee when we come to the recess period.

Now, in the meantime, Senator, suppose you proceed.

Senator HICKENLOOPER. Admiral Gingrich has resigned or separated himself from the office of Director of Security Intelligence; that is the case, is it not?

Mr. LILIENTHAL. That is correct, as of May 1.

Senator HICKENLOOPER. Do you have a new Director at this time?

Mr. LILIENTHAL. No; we do not.

Senator HICKENLOOPER. Do you have any judgment at the moment as to how long it will take to replace him?

Mr. LILIENTHAL. I should think not too long; although it is clear that we will not be able to concentrate on that matter, still it is of such importance that I believe we will be able to replace him in a comparatively short period of time.

Senator HICKENLOOPER. Do you believe his resignation from this post was a loss to the Commission?

Mr. LILIENTHAL. I believe that Admiral Gingrich was a real—I was about to say soldier; I suppose he would resent that—was a real patriot in undertaking so difficult a task at a time when he knew other men had been unwilling to undertake it.

I believe he has served his country very well indeed in the period of the almost 2 years of the rendering of his service.

He had qualities of judgment that were very helpful to the Commission, and I believe to the country, and I, therefore, think that his going is a loss.

I do not mean to say that there are not other men if they can be persuaded to undertake this stormy assignment, who might not, and probably will at a later stage in the undertaking, add things to the enterprise which Admiral Gingrich's background and qualifications, perhaps, did not supply.

Senator HICKENLOOPER. Now, Mr. Jones, I believe you said, was Acting Director of Security prior to Admiral Gingrich.

Mr. LILIENTHAL. Yes, sir.

Senator HICKENLOOPER. Was he an experienced security man?

Mr. LILIENTHAL. Yes. He served during the war, during the Manhattan District days as, I believe, the security officer in charge at Los Alamos, at least for a part of that period.

I am not familiar with the details of that service, but that is one of the important posts he had.

Senator HICKENLOOPER. Did he have a background of security training?

Mr. LILIENTHAL. Well, he was actually a railroad rate man, and in private life that is what he did; when he came into the Army, whatever security experience he had he secured with the Manhattan District.

Senator HICKENLOOPER. He was security officer at Bikini, was he not, the Bikini tests?

Mr. LILIENTHAL. Yes, he was.

Senator HICKENLOOPER. Do you consider Mr. Jones an able security officer?

Mr. LILIENTHAL. Yes; I think he is an able security officer, and an able man.

Senator HICKENLOOPER. What is his position now with the Commission?

Mr. LILIENTHAL. He is Assistant Secretary to the Commission.

Senator HICKENLOOPER. And among other things, he assists in the preparation of minutes of the Commission that they may take?

Mr. LILIENTHAL. Yes. Mr. Jones asked to be relieved of the onerous responsibilities involved in security, and by his own choice he became Assistant Secretary.

Senator HICKENLOOPER. He asked to be relieved from that job, is that it?

Mr. LILIENTHAL. That is my understanding.

Senator HICKENLOOPER. Yes.

Are you acquainted with Dudley Frank, Deputy Director of Security, who was at one time Deputy Director of Security in the Commission?

Mr. LILIENTHAL. I was acquainted with him in a limited way, as one would be on a policy board, but I do know him.

Senator HICKENLOOPER. Do you know where he came from to the Commission?

Mr. LILIENTHAL. No, I do not.

Senator HICKENLOOPER. I believe War Assets Administration as a Government employee, and he came over as Deputy Director of Security.

I take it that you are not familiar with any background of security experience that he may have had.

Mr. LILIENTHAL. No.

Admiral Gingrich, as is true in good organization, was given rather a free hand to select those men that he wanted to work with him, and he did select Mr. Frank. I am not familiar with his background.

Senator HICKENLOOPER. Do you know where Mr. Frank is now?

Mr. LILIENTHAL. No, I do not.

Senator HICKENLOOPER. He has left the Commission, I believe?

Mr. LILIENTHAL. He has left the Commission.

Senator HICKENLOOPER. Do you know enough about him to estimate whether or not he is a loss to the Commission when he left the Commission?

Mr. LILIENTHAL. No; I would not know. I do know that the work for which he and others were responsible during the period of his incumbency has greatly improved. Of this I am sure, that at the appropriate time we will go into that here, and, therefore, he had something to contribute.

Senator HICKENLOOPER. Now, the office of the Chief of Personnel Clearance is also an important office, is it not, that is, as distinguished from personnel and security?

Mr. LILIENTHAL. It is that division; yes, it is.

Senator HICKENLOOPER. Do you know Mr. William L. Uanna who was Chief of Personnel Clearance?

Mr. LILIENTHAL. As I recall he was an officer in the Manhattan District; yes, I do remember him.

Senator HICKENLOOPER. And I believe he had something to do with the operation of the first bomb drops, and things of that kind at the Manhattan District.

Mr. LILIENTHAL. That may be; I am not familiar with that.

Senator HICKENLOOPER. Then, he became Chief of Personnel Clearance in the Washington headquarters of the Commission. Do you know where he has gone?

Mr. LILIENTHAL. No; I do not.

Senator HICKENLOOPER. He is not with the Commission any more?

Mr. LILIENTHAL. No; he is not.

Senator HICKENLOOPER. Would you consider him an able man?

Mr. LILIENTHAL. I have no way of judging. Certainly his service to the Manhattan District, I am sure, was satisfactory, or we would have heard of it. I have no way of judging the man.

Senator HICKENLOOPER. I believe he had a law degree and an engineering degree, and that he has now gone to the Armed Forces Special Weapons Group, with the special weapons group.

Are you acquainted with Judson Ford?

Mr. LILIENTHAL. Yes, I am, rather casually.

Senator HICKENLOOPER. He was the second Chief of Personnel Clearance, I believe, is that correct?

Mr. LILIENTHAL. Under Admiral Gingrich, yes, I believe that is the case.

Senator HICKENLOOPER. Do you consider that the Chief of Personnel Clearance must have a knowledge of security and Communist-front organizations and subversive-front organizations and their ramifications?

Mr. LILIENTHAL. I should think that would be one of the qualities that would make a good personnel clearance officer; yes, sir.

Senator HICKENLOOPER. Do you know where Mr. Ford came from?

Mr. LILIENTHAL. No; I do not.

Senator HICKENLOOPER. I believe he came from War Assets also.

Mr. LILIENTHAL. All I know is that Admiral Gingrich staffed himself, and Mr. Ford was one of his selections.

Senator HICKENLOOPER. I see.

Are you sure about that or was Mr. Ford there before Admiral Gingrich came in?

Mr. LILIENTHAL. That may be, but at any rate he was retained by Admiral Gingrich.

Senator HICKENLOOPER. But is not any longer in that job, as I understand?

Mr. LILIENTHAL. I so understand.

Senator HICKENLOOPER. And has been separated for some time?

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. Do you know Lawrence B. Brock of the Personnel Clearance Department, Lawrence B. Brock?

Mr. LILIENTHAL. No; I do not know him.

Senator HICKENLOOPER. Mr. Brock was a screener, who screened applications, and evaluated the derogatory information that might

be discovered on individuals in their applications for jobs. Do you know why he quit?

Mr. LILIENTHAL. No; I do not. I know that during the period of Admiral Gingrich's services and at his recommendation, a great deal of decentralization of this personnel clearance work took effect; that is to say, the managers of operation, with criteria agreed upon in advance, did a great deal of their personnel clearance work, and this may well have accounted for the changes.

The effort was to get out of Washington and as close as possible to the men doing their work, and their supervisors, the judgments and evaluations of the information about individuals being investigated for clearance, and this may account for the changes.

Senator HICKENLOOPER. Do you know Mr. William Moran, assistant to the Director of Security at the headquarters in Washington at one time, some time ago?

Mr. LILIENTHAL. I assume I have met him, but I do not recall.

Senator HICKENLOOPER. He was also a screener, along with Mr. Brock, who—

Mr. LILIENTHAL. What was he, Senator?

Senator HICKENLOOPER. A screener.

Mr. LILIENTHAL. Oh, I misunderstood you.

Senator HICKENLOOPER. A screener; he was one of the people who took the original applications and gave them their original evaluation as to derogatory information or the lack of it.

Mr. LILIENTHAL. Yes.

Senator HICKENLOOPER. Mr. Moran has quit the project. I take it that not knowing either of these men, you would not be in a position to evaluate their loss to the Commission.

Mr. LILIENTHAL. No; and if I may comment just for a moment on this, the Commission, at the outset, realized that the problem of personnel clearance was of such a magnitude and of such difficulty that if we did not delegate this to the best men we were able to find and set up procedures for this work, that we would be able to do nothing else. In fact, we tried for quite a while to keep in very close touch with all of these files.

There were some hundred thousand investigations involved, a very large undertaking, so we set up procedures and sought to improve them, and to try to get men with the best possible qualifications to do this work. The Commission itself did not, and I believe wisely could not, follow the details of the administration of that work.

Senator HICKENLOOPER. I understand the details could not be followed. I am talking about the key personnel, and I am discussing, of course, the evident lack of continuity in the administrative heads of these important departments.

Mr. LILIENTHAL. Of course, the Senator is fully cognizant of the fact—as fully as I—that a new organization has the problem of finding men best qualified, and it does involve changes from time to time. An organization that does not do it is not likely to be very good.

Senator HICKENLOOPER. Now, do you know Dr. William Shurcliff?

Mr. LILIENTHAL. Yes; I do.

Senator HICKENLOOPER. He was an evaluator in the Intelligence Division, was he not?

Mr. LILIENTHAL. Yes; that was his post.

Senator HICKENLOOPER. And do you consider him to be an able man?

Mr. LILIENTHAL. Everything I heard about him as a scientist, and in other ways, reflected to his credit. He was, I believe, the historian, or one of the historians, of the Bikini enterprise.

Senator HICKENLOOPER. And his job, I believe, was the highly important job of evaluating intelligence in atomic energy, is that not correct?

Mr. LILIENTHAL. Yes, that is correct.

Senator HICKENLOOPER. I believe Dr. Shurcliff quit the project. I do not know—I am not announcing the reasons, but he did terminate his employment with the Commission, is that correct?

Mr. LILIENTHAL. Yes, he did; and Dr. Colby of the University of Michigan later became Director of Intelligence.

Senator HICKENLOOPER. Yes, I am aware of that.

Would you say that the termination of Dr. Shurcliff, the termination of his services to the Commission, resulted in a loss to the Commission?

Mr. LILIENTHAL. I am not in a position to say, because that would be—I would say, my impression is, and this is without any reflection at all on Dr. Shurcliff, that Dr. Colby has the years and the maturity and the war experience that makes him a superior man for this post, so that I would say that we are better off than we were, but this is without any reflection at all on Dr. Shurcliff who is a relatively young man.

Senator HICKENLOOPER. Do you know Dr. Paul Fine?

Mr. LILIENTHAL. Yes, I do.

Senator HICKENLOOPER. Dr. Paul Fine was engaged with Dr. Shurcliff in intelligence evaluation, is that correct?

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. And Dr. Fine is no longer in the intelligence evaluation section or department of the Commission, is that correct?

Mr. LILIENTHAL. Yes. He is now an assistant to Gen. James McCormack, Director of Military Application of the Commission.

Senator HICKENLOOPER. Yes.

Now, in fact, Dr. Fine and Dr. Shurcliff terminated their connection with the intelligence section because of a rather substantial dispute that they got into on policies, is that correct? I do not intend to go into that in detail at the moment but—

Mr. LILIENTHAL. What the occasion for their changing was, I do not know. What I do know, and what the Commission—

Senator HICKENLOOPER. They joined in writing a letter that set out their reasons very clearly, did they not?

Mr. LILIENTHAL. Yes, there were differences about intelligence, and these are not uncommon.

Senator HICKENLOOPER. Yes.

Mr. LILIENTHAL. These are not uncommon, and Dr. Colby, I believe, is doing as good a job as one can hope for in this very difficult field.

Senator HICKENLOOPER. Now, that was a dispute between Drs. Fine and Shurcliff, on the one hand, and Admiral Gingrich on the other, I believe. Is that correct?

Mr. LILIENTHAL. Yes, I believe initially intelligence was in Admiral Gingrich's field.

Senator HICKENLOOPER. Do you care to say whether you sustained Admiral Gingrich or Drs. Fine and Shurcliff in that dispute?

Mr. LILIENTHAL. This is a matter that I do not recall the Commission's intervening in. It was a management matter, except in this respect: That the Commission did decide to separate intelligence activities from security, because of the different characteristics, to make the intelligence activities responsible directly to the office of the General Manager, and to get a man of such years and experience and judgment and maturity that working with the CIA would be more effective than it had been with the younger men.

I think the results and the improvement that occurred indicate that was a wise step to take.

Senator HICKENLOOPER. Drs. Fine and Shurcliff were both younger nuclear physicists of considerable ability and some considerable experience, were they not?

Mr. LILIENTHAL. As physicists, yes. Both of them are able men, good men. These differences were honest differences of opinion in a field in which there is not any absolute yardstick that I know of.

Senator HICKENLOOPER. Well, now, let us go out into the field offices for awhile, which were run by Washington, the administrative office here.

Are you acquainted with Mr. John Mahoney, of Chicago?

Mr. LILIENTHAL. No; I am not.

Senator HICKENLOOPER. I believe he was Chief of the Security Division of the Chicago area, and that he is no longer with the Commission.

Mr. LILIENTHAL. Yes; he has been replaced by an FBI man, Mr. Yore.

Senator HICKENLOOPER. Yes. And Mr. James Yore is now the Security Director at Chicago.

Mr. LILIENTHAL. Yes, Mr. Yore, whose background is principally FBI, is now the security officer in Chicago.

Senator HICKENLOOPER. Would you care to state whether you consider Mr. John Mahoney capable in the Chicago office or not?

Mr. LILIENTHAL. I have no basis for judgment. This was a matter of management that I do not recall being concerned about.

Senator HICKENLOOPER. Do you know how long the Chicago office was without a Security Director?

Mr. LILIENTHAL. No, I do not. I know it is difficult to recruit for the Government services these days, and there may well have been a period in which there was no security officer there.

Senator HICKENLOOPER. Do you know Mr. Walter White, who was security officer, chief security officer, in the Berkeley area field office?

Mr. LILIENTHAL. No, I do not. I know the present security officer because of my visits there.

Senator HICKENLOOPER. Do you know when Mr. White terminated his employment there?

Mr. LILIENTHAL. No, I do not.

Senator HICKENLOOPER. Do you know when the present security officer took over his job?

Mr. LILIENTHAL. No. My knowledge about the security officer at Berkeley is based on my visits there; and how long before my visit the present incumbent took office, took his post, I do not know.

Senator HICKENLOOPER. And so, you would not be in a position to evaluate Mr. White's—

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER (continuing). Service to the program?

Mr. LILIENTHAL. There are other people in the Commission office who would be able to, but I doubt whether the Commissioners would.

Senator HICKENLOOPER. Do you know the Personnel Security Director at Los Alamos—do you know who he was? I do not mean Mr. Sidney Newburger—

Mr. LILIENTHAL. You mean during the Commission's—

Senator HICKENLOOPER. Yes.

Mr. LILIENTHAL. I had the impression that a man by the name of Smith was the security officer there during the entire period of the Commission's—

Senator HICKENLOOPER. I see.

Mr. LILIENTHAL. That was in the laboratory, I am advised.

Senator HICKENLOOPER. But I am talking about the Commission's employees, not the contractor's employees.

Mr. LILIENTHAL. No.

Senator HICKENLOOPER. Do you know who is the security officer at Los Alamos now?

Mr. LILIENTHAL. No, I do not.

Senator HICKENLOOPER. Los Alamos is one of our most vital installations, is it not?

Mr. LILIENTHAL. Yes, I know there is a security officer there, but his name I do not know.

Senator HICKENLOOPER. Do you know whether it is Mr. B. O. Wells or not?

Mr. LILIENTHAL. No, I do not.

Senator HICKENLOOPER. Have you met Mr. Wells?

Mr. LILIENTHAL. I assume I have. I have met almost everyone at Los Alamos.

Senator HICKENLOOPER. I believe Mr. Wells is a retired naval officer.

Mr. LILIENTHAL. I have sat in a good many staff meetings, large staff meetings at Los Alamos, and I am sure it is Mr. Wells, but the name, I do not remember that.

Senator HICKENLOOPER. I may suggest that Mr. Newburger was security officer or Security Director, according to my information, at Los Alamos, and he is still there, but he has had two other people superimposed over him now, and just what his job is I cannot quite find out.

Do you know who the Personnel Director of Security at Hanford under the Commission was?

Mr. LILIENTHAL. The name escapes me at the moment, Mr. Senator.

Senator HICKENLOOPER. I believe it was Mr. Ben Montjoy.

Mr. LILIENTHAL. I think I met the original security officer at Hanford on my first visit to Hanford, which was a good many months after the Commission took over. I know the present security officer, although his name for the moment escapes me.

Senator HICKENLOOPER. Mr. Montjoy, I believe, for the sake of the record, was continued as Director of Security at Hanford, and was formerly security officer under the Manhattan District when Hanford was built.

You do not know when he quit?

Mr. LILIENTHAL. No, I do not. I know that a great many changes have been made, and I would say that comparing the situation when the Commission took over and presently as to security in the over-all, this has been an improvement.

Senator HICKENLOOPER. Yes.

Now, you would have no judgment on whether Mr. Montjoy was a capable security officer or not, not knowing anything about his activities?

Mr. LILIENTHAL. No, I would not. I would assume he was.

Senator HICKENLOOPER. I believe Mr. Shuman is the present security officer at Hanford.

Mr. LILIENTHAL. That is correct. Shuman is also a Manhattan District former employee, I am told.

Senator HICKENLOOPER. Yes.

Now, do you know when Mr. Bernard Menke, the Director of Security at Oak Ridge, arrived there?

Mr. LILIENTHAL. Not exactly. It has been quite a period, but I could find out what that date is.

Senator HICKENLOOPER. Do you have an opinion as to whether or not he is a capable security officer?

Mr. LILIENTHAL. I have every reason to believe that he is an able man, a devoted security officer.

Senator HICKENLOOPER. Yes.

You are acquainted with Mr. Paul Ager?

Mr. LILIENTHAL. Yes, I am.

Senator HICKENLOOPER. He was Director of the Budget, employed by the Commission at the Washington office, and he has now left the Washington office, has he not?

Mr. LILIENTHAL. That is correct; he is at Los Alamos.

Senator HICKENLOOPER. I believe that he gave the reason for the transfer to Los Alamos as his health, is that not so?

Mr. LILIENTHAL. Yes, I believe that is true.

Senator HICKENLOOPER. Is Mr. Ager a good man?

Mr. LILIENTHAL. Mr. Ager is a fine man.

Senator HICKENLOOPER. Do you consider his loss as Budget Director here in the central office in Washington a distinct loss to the Commission?

Mr. LILIENTHAL. With no disrespect at all to Mr. Ager, I believe not, because his health had been adversely affected by the very long hours and strenuous work here, and to the point where it would be only a matter of months before he would crack, and I think, therefore, it is not a loss in that sense.

If I may complete that, I think it is also important to note that Los Alamos needed strengthening greatly in respect to budgets and accounting matters, and Mr. Ager, I believe, has been rendering good service there, so that taking it in the over-all, I would say that he is better placed now than he was before.

Senator HICKENLOOPER. Without getting into the nature of the illness of the individual particularly, if I recall correctly, there was a

visit with Mr. Ager in which he said that his difficulty, as I recall, was some temporary trouble with his back, and I did not get the impression that he was exhausted from overwork, but that may be true.

Mr. LILIENTHAL. He had a very serious operation, Senator.

Senator HICKENLOOPER. Now, you are acquainted with Dr. James Fisk, who was Director of Research for the Washington office?

Mr. LILIENTHAL. Yes; I am.

Senator HICKENLOOPER. When did Dr. Fisk come to the Commission?

Mr. LILIENTHAL. The first of February 1947.

Senator HICKENLOOPER. Yes.

And he left the Commission when?

Mr. LILIENTHAL. About a year and a half later, was it not? August 27, 1948, I am told.

Senator HICKENLOOPER. Of last year?

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. Now, do you consider Dr. Fisk an able man?

Mr. LILIENTHAL. An extraordinarily able man.

Senator HICKENLOOPER. I agree with you on that. He is an extraordinarily able man. In fact, I believe he is an outstanding man.

Do you consider his termination of his employment as Director of Research for the Commission as being a loss to the Commission?

Mr. LILIENTHAL. Yes; and I spent a good many hours explaining in detail just how much of a loss, but without much success. The answer is "yes," definitely.

Senator HICKENLOOPER. And I believe you have replaced Dr. Fisk now with a doctor of research, a new man, have you not?

Mr. LILIENTHAL. Yes; we have Dr. Kenneth Pitzer, formerly of the University of California, a chemist. Also an extraordinarily able man.

Senator HICKENLOOPER. Now, there was a Personnel Security Review Board set up some time ago, a year or so ago, I believe, consisting of Justice Owen Roberts, and Dr. Karl Compton, Joseph C. Grew, former Ambassador to Japan; Mr. George Humphrey, and Mr. H. W. Prentis, Jr. It has been sometime in the last year when that Board was set up, is that correct?

Mr. LILIENTHAL. Yes.

Senator HICKENLOOPER. They all resigned last fall, did they not?

Mr. LILIENTHAL. They were set up January 1948 as an interim board, and resigned in October.

Senator HICKENLOOPER. September or October, as I understand it.

Mr. LILIENTHAL. In 1948, something like that.

Senator HICKENLOOPER. So, they are no longer with the Commission. Have you appointed a new Personnel Security Review Board?

Mr. LILIENTHAL. Yes. It should be said that this board was an advisory board and was temporary in its terms, and it was understood by the members that it would be temporary, and a new board has been named.

Senator HICKENLOOPER. Well, may I suggest that so far as the temporariness of the matter—

Mr. LILIENTHAL. Pardon?

Senator HICKENLOOPER. I say, so far as the temporariness of this board is concerned, when they were set up—I am not disputing that at all, but I would say that in talks with Justice Roberts, I was not given to understand that he at that time considered it to be temporary, and these men—just to hurry on because I want to get through here, so that the other members can ask any questions they may want—I will call attention to the fact that in the Fifth Semiannual Report of the Commission, published in January 1949, there is no mention of the temporary nature of the people of the board, and they are in fact in January—regardless of whether they resigned in September or October—they are listed in January as the members of the Personnel Security Review Board.

Mr. LILIENTHAL. I think there is no question about the record as to their charter in that respect, Senator.

Senator HICKENLOOPER. Now, these people that I have canvassed who are in a few of the key positions of the Washington office, I want to leave them for just a moment.

I would like to go into the definite field operations.

Mr. LILIENTHAL. May I interrupt?

Senator HICKENLOOPER. Yes, sir.

Mr. LILIENTHAL. You asked about a review board.

Senator HICKENLOOPER. Yes.

Mr. LILIENTHAL. May I indicate the names of the new members?

Senator HICKENLOOPER. Yes.

Mr. LILIENTHAL. The chairman of the board is Charles Fahy, who is in private practice of law, and one time Solicitor General of the United States and Legal Adviser to the Department of State; President Arthur S. Flemming, now of Ohio Wesleyan University, and for a good many years member of the Civil Service Commission of the United States; and Mr. Bruce D. Smith, an industrialist of New York.

Senator HICKENLOOPER. Going to the field operations, which are not operating strictly out of the Washington office, I would like to move down to Oak Ridge for just a moment, and I do want to hurry.

Do you recall who the first Manager of the Oak Ridge operations was?

Mr. LILIENTHAL. During the tenure of the Commission?

Senator HICKENLOOPER. Yes; during the tenure of the Commission.

Mr. LILIENTHAL. W. J. Williams, who is now Director of Production, was the operating Manager.

Senator HICKENLOOPER. He was Acting Manager down there, was he not, at that time?

Mr. LILIENTHAL. That is correct. He was the builder of K-25.

Senator HICKENLOOPER. He went in, I believe, after General Nichols left and went back to the Army.

Mr. LILIENTHAL. I believe that is correct.

Senator HICKENLOOPER. Then Mr. Williams was there for a time, and Mr. John C. Franklin was brought in as Manager of the operations there; was he not?

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. Do you recall the approximate date that he came in?

Mr. LILIENTHAL. He came in September of 1947.

Senator HICKENLOOPER. In September 1947. Where does Mr. Franklin come from?

Mr. LILIENTHAL. From Kansas City, where he was vice president of the Trans-World Airlines, in charge of engineering and maintenance.

Senator HICKENLOOPER. I believe he came to the operation there as Manager at a salary of about \$18,000 a year; did he not?

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. As I understand it, that was less than he was either getting or at least as much as he was getting from the job from which he came; is that correct?

Mr. LILIENTHAL. It is my understanding that his salary of \$18,000 was less than what he was receiving with TWA.

Senator HICKENLOOPER. And he resigned from TWA, did he not, completely?

Mr. LILIENTHAL. Yes.

Senator HICKENLOOPER. Retained no connection with TWA at all?

Mr. LILIENTHAL. I believe not.

Senator HICKENLOOPER. He came willing to accept that salary; is that your understanding?

Mr. LILIENTHAL. Yes.

Senator HICKENLOOPER. So that salary was satisfactory with him when he came? Was that your understanding?

Mr. LILIENTHAL. He certainly would not have come if it had not been satisfactory.

Senator HICKENLOOPER. And he understood, I am sure, that this was a most vital and important managerial operation in the Commission when he came.

Mr. LILIENTHAL. Yes, sir.

Senator HICKENLOOPER. You do not know what is in his mind; I do not mean for you to say that.

Mr. LILIENTHAL. I assume that.

Senator HICKENLOOPER. It is a sound assumption.

Mr. LILIENTHAL. We certainly said that to him in many ways.

Senator HICKENLOOPER. He has resigned as Manager of the Oak Ridge operation; is that correct?

Mr. LILIENTHAL. That is correct, and at the appropriate time I will indicate reasons.

Senator HICKENLOOPER. I would be glad to have you do that.

Mr. LILIENTHAL. Mr. Franklin came on the distinct understanding that in not to exceed 2 years he would feel that he had made his contribution and could then return to private industry, where he has every right to expect and I myself expect that he will become in the course of time one of the principal executives in industry in the country at the compensations that are available in industry.

He has done a fine job of getting things started down there, we are very reluctant to see him go, but he has not violated his assurances to us at the outset that he could not stay for very long.

Senator HICKENLOOPER. Mr. Lilienthal, I recall the discussions with the joint committee and the Commission at the time this matter of securing able managers for these installations was had, and I may be wrong about this, but I have no recollection whatsoever of any discussion of any temporary employment on the part of Mr. Franklin, and my memory—I think that can be checked with the minutes—but my memory is that the justification which the Commission offered for paying salaries of this kind and against which no action was taken by the joint committee, but the justification

was to get men of ability from industry who would permanently stay in these jobs.

Now, I do not know—Mr. Franklin may have had some reservations in his mind, I do not say that he did not have, but I can say it was not my impression from those discussions that he did so have any reservations.

Do you know what job he is taking now?

Mr. LILIENTHAL. No; I do not. I do not know that he has any.

Senator HICKENLOOPER. So, as far as you know, he is leaving the Commission management without having definitely determined on another job?

Mr. LILIENTHAL. Yes; I am sure he is not worried on that score because he is an unusual man, unusual executive.

I think I should say, Senator, that both the case of Dr. Fisk and Mr. Franklin are not untypical of the problem the Commission has had in recruitment of people from outside sources where they have indicated that they are very dubious about whether they shall care for Government service, and where they are anxious to make a contribution and have come on that basis. We have always hoped they could be persuaded to stay on.

Senator HICKENLOOPER. Yes, I understand those difficulties.

Do you have a new Manager yet for Oak Ridge?

Mr. LILIENTHAL. No; we have not.

Senator HICKENLOOPER. How long before May 1 did you know that Mr. Franklin was going to resign?

Mr. LILIENTHAL. About 30 days prior. I think about April 1. My understanding is he will not actually leave for some weeks.

Senator HICKENLOOPER. Did he stay out the full 2 years that you understood he might stay?

Mr. LILIENTHAL. Not quite. He came in September and I believe he will leave about the 1st of July.

Senator HICKENLOOPER. Now, I want to discuss this just a moment. You know Mr. Carlton Shugg, Area Manager at Hanford?

Mr. LILIENTHAL. Yes.

Senator HICKENLOOPER. Who was Area Manager at Hanford. Mr. Shugg came from the Todd Shipyards; is that correct?

Mr. LILIENTHAL. That is correct, sir.

Senator HICKENLOOPER. You would consider him an able technical man?

Mr. LILIENTHAL. Yes, indeed.

Senator HICKENLOOPER. He came in at about the same time Mr. Franklin did and for generally the same reasons, that it was considered essential that able men from industry come into the managerial positions in these operations?

Mr. LILIENTHAL. Yes.

Senator HICKENLOOPER. Is that a fair statement?

Mr. LILIENTHAL. As much as possible to get men with industrial or business experience.

Senator HICKENLOOPER. Mr. Shugg came to the management of the Hanford Works as a technical man and at a salary of \$18,000 a year; is that correct?

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. How long was he at Hanford as Manager?

Mr. LILIENTHAL. About a year.

Senator HICKENLOOPER. About a year. Do you consider that he did a good job?

Mr. LILIENTHAL. I consider he did a phenomenal job, considering what he took over and the problems involved; yes.

Senator HICKENLOOPER. You consider, I take it, that he was an able and outstanding manager for that kind of job?

Mr. LILIENTHAL. Yes; he justified the hopes that his record in industry gave us as to what he could do there; yes.

Senator HICKENLOOPER. Where is Mr. Shugg now in the Commission?

Mr. LILIENTHAL. Under the new organization of the Commission, which took place last autumn, he is now Deputy General Manager.

Senator HICKENLOOPER. He came down at the time that reorganization was put into effect, did he not?

Mr. LILIENTHAL. Shortly thereafter; yes, sir.

Senator HICKENLOOPER. And so Mr. Shugg is now Deputy General Manager of the Commission. Is he still receiving the same salary?

Mr. LILIENTHAL. He is.

Senator HICKENLOOPER. \$18,000 a year?

Mr. LILIENTHAL. Yes, sir.

Senator HICKENLOOPER. What is the salary of the General Manager of the Commission?

Mr. LILIENTHAL. The General Manager's salary, as fixed by the McMahon Act, is \$15,000 a year.

Senator HICKENLOOPER. Now, who replaced Mr. Shugg at Hanford as Manager?

Mr. LILIENTHAL. Mr. Fred Schlemmer.

Senator HICKENLOOPER. He is now Manager at Hanford?

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. Mr. Schlemmer came immediately to Hanford from where?

Mr. LILIENTHAL. From industry, from a large woolen mill, the name of which escapes me at the moment, at Chattanooga, Tenn.

Senator HICKENLOOPER. In the South, and he had been there somewhat over a year, either as president of that company or as a top executive; is that correct?

Mr. LILIENTHAL. I have forgotten the period, but that is generally correct.

Senator HICKENLOOPER. And for some 13 or 14 or 15 years prior to that woolen mill experience, do you know what his background had been?

Mr. LILIENTHAL. Oh, yes; he was one of the chief project engineers of the Tennessee Valley Authority and was in charge of the building of Fontana, Chickamauga, Norris, and Watts Dams.

Senator HICKENLOOPER. He was there during your tenure?

Mr. LILIENTHAL. Yes.

Senator HICKENLOOPER. He is getting \$18,000 a year?

Mr. LILIENTHAL. The same salary as Mr. Shugg.

Senator HICKENLOOPER. I believe for the year or so he was with the woolen mills during the interim between the transition from TVA and Hanford, he was getting a salary reputed to be in the twenty thousands, \$25,000 or something.

Mr. LILIENTHAL. In excess of \$25,000, I believe.

Senator HICKENLOOPER. But as engineer of TVA during those years prior to that short period of woolen mills experience, he was getting just short of \$10,000, was he not?

Mr. LILIENTHAL. His dollar compensation was just short of \$10,000.

Senator HICKENLOOPER. Now, may I ask you if you care to state why it was necessary to bring Mr. Shugg to Washington as Deputy General Manager?

Mr. LILIENTHAL. Well, this is part—his coming to Washington or the creation of the office of Deputy General Manager with various functions assigned to that deputy were a part of the general reorganization of the Commission which took place during the summer and early fall. He was brought to Washington as perhaps the man best able to serve as a deputy to the General Manager for a number of reasons, which I desire to go into.

Senator HICKENLOOPER. Yes. It was considered that a reorganization was essential in the more efficient operation of the program; is that correct?

Mr. LILIENTHAL. Yes; it certainly was considered that it was important to reshape the organization after the amount of experience we had.

Senator HICKENLOOPER. In passing, in connection with that point, I have been very interested in an article written by Mr. Richard O. Niehoff, who was Special Assistant to the General Manager of the Atomic Energy Commission in the summer of 1948, and published in the Public Administration Review. I assume Mr. Niehoff, as Special Assistant to the General Manager of the Atomic Energy Commission, was writing this article about the organization of the Commission and its smooth and efficient coordination with the approval of his superiors. I would like without reading it or quoting, Mr. Chairman, to have the article, if I may, put in the record of the hearings.

The CHAIRMAN. Very well, it may be done.

(The article referred to is as follows:)

[From Public Administration Review, Spring 1948, Vol. 8]

# ORGANIZATION AND ADMINISTRATION OF THE UNITED STATES ATOMIC ENERGY COMMISSION

(By Richard O. Niehoff, special assistant to the General Manager, Atomic Energy Commission)

## STATUTORY BASIS

Within a few weeks after the first atomic bombs had exploded over Hiroshima and Nagasaki, the Congress of the United States, in full realization of the tremendous potentialities of the new force, addressed itself to the difficult task of creating an act of public policy to guide its further development. The lucid declaration of policy contained in the Atomic Energy Act of 1946 is the result of months of hearing and considering the testimony of scientists, military experts, administrators, and men of affairs qualified to evaluate the manifold aspects of the Nation's atomic energy project. The Special Committee on Atomic Energy of the United States Senate unanimously reported the draft bill, the Senate voted unanimous approval, and an overwhelming majority of the members of the House concurred in the expression of policy which follows:

Research and experimentation in the field of nuclear chain reaction have attained the stage at which the release of atomic energy on a large scale is practical. The significance of the atomic bomb for military purposes is evident. The effect of the use of atomic energy for civilian purposes upon the social,

economic, and political structures of today cannot now be determined. It is a field in which unknown factors are involved. Therefore, any legislation will necessarily be subject to revision from time to time. It is reasonable to anticipate, however, that tapping this new source of energy will cause profound changes in our present way of life. Accordingly, it is hereby declared to be the policy of the people of the United States that, subject at all times to the paramount objective of assuring the common defense and security, the development and utilization of atomic energy shall, so far as practicable, be directed toward improving the public welfare, increasing the standard of living, strengthening free competition in private enterprise, and promoting world peace.

More specifically, the Congress set forth the following programs to effectuate this general policy:

(1) A program of assisting and fostering private research and development to encourage maximum scientific progress;

(2) A program for the control of scientific and technical information which will permit the dissemination of such information to encourage scientific progress, and for the sharing on a reciprocal basis of information concerning the practical industrial application of atomic energy as soon as effective and enforceable safeguards against its use for destructive purposes can be devised;

(3) A program of federally conducted research and development to assure the Government of adequate scientific and technical accomplishment;

(4) A program for Government control of the production, ownership, and use of fissionable material to assure the common defense and security and to insure the broadest possible exploitation of the fields; and

(5) A program of administration which will be consistent with the foregoing policies and with international arrangements made by the United States, and which will enable the Congress to be currently informed so as to take further legislative action as may hereafter be appropriate.

Throughout the more than 1,000 pages of published testimony given before the Special Senate Committee to investigate "problems relating to the development, use, and control of atomic energy" and before the same committee in hearings on the proposed McMahon bill (S. 1717), plus additional hearings before the Committee on Military Affairs of the House of Representatives, there are paraded the will-considered thoughts of scores of the country's ablest and best qualified authorities on this new problem. Additional testimony presented off the record undoubtedly put the legislators in a position to become familiar with even more complex and deeply disturbing domestic and international implications of the new force with which they were dealing. Strong arguments were made to delay legislative action until satisfactory international safeguards and agreements could be developed. But the study of the problem in its entirety convinced the Congress of the necessity for the early establishment of basic policy which would place our peaceful intentions before the world and also for getting on with the work necessary to realize the great constructive possibilities which unhappily were slowly eroding as a result of the understandable postwar lack of governmental policy for peacetime development.

Out of the close questioning of witnesses and the conscientious weighing of conflicting testimony, the Congress distilled the principles out of which a legislative framework was created for the guidance of the Atomic Energy Commission. The provisions which bear most directly on the organization and administration of the country's atomic energy program are indicated below. This article does not attempt to present a detailed analysis of the legislative history of the statute; rather, it summarizes selectively the most important determinations bearing on organization and administration.

1. The provision of a full-time five-man civilian commission appointed by the President and confirmed by the Senate for an initial term of two years at salaries of \$15,000 per annum for four commissioners and \$17,500 for the chairman. Alternatives offered to the Congress included a combination of possibilities—a part civilian, part military commission; a part-time commission; a mixed commission of part-time Cabinet officers and full-time commissioners not involved in other governmental pursuits; and a commission of nine or more persons selected with a view to securing representatives of business, scientific, and other interests. Various witnesses expressed concern over the country's ability to persuade men of the necessary stature to serve on a full-time policy board, at even the highest salary levels ordinarily paid by the government, when such service required renouncing all private interests which might possibly be in conflict with the public interest in this somewhat nebulous field.

2. The provision of the position of general manager appointed by the President and confirmed by the Senate at a salary level commensurate with that of the com-

missioners. No serious debate was introduced to challenge the need for a manager to carry out commission policies. A recommendation to put the new agency under a single head was considered; it was recognized, however, that complex policy issues needed to be considered by a variety of minds and backgrounds and the appeal of this more "streamlined" conception of administration was overruled. To assure a healthy integration of policy and administration the Congress provided the commission with advisory powers to the President with respect to the appointment or removal of the general manager.

3. The provision for four statutory divisions (research, engineering, production, and military application) within the commission, each division to be headed by a director appointed by the commission with compensation at the rate of \$14,000 per annum. The commission was also authorized to create other organizational units as required. The specification by the Congress of part of the internal organization of the commission is doubtless a byproduct of the intensive and extensive acquaintance which it developed with the program content of atomic energy. The creation of the division of military application is of key importance as a recognition of the need for technical military participation in an agency essential to the military defense of the United States. The director of the division of military application is required to be a member of the armed forces; as a matter of practice all members of this division, except the secretarial and administrative staff, are members of the armed forces.

4. The provision of a part-time, nine-member General Advisory Committee to advise the commission on scientific and technical matters relating to materials, production, research, and development, to be appointed from civilian life by the President. The provision for the General Advisory Committee clearly grew out of congressional recognition of the commission's need for advice on the immensely complex technical and scientific problems of this new "industry." Furthermore, its creation cleared the way for the appointment of commissioners who, although one or more of them might well be persons with scientific background, could act on policy matters as a group from the broadest, general perspective. Being assured of independent advice on complex technical matters, the commission is not tempted to compartmentalize its judgments or specialize as members in one or another phase of the program. The independent character of the committee, assured in part by direct presidential appointment of the members; the requirement of holding at least four meetings per year; the provision of better-than-average governmental compensation (although far below fees for comparable private consultation) combine to create an essential facility which provides the commission with highly objective advice on the more technical problems which are constantly emerging.

5. The provision of a Military Liaison Committee "consisting of representatives of the Departments of War and Navy,<sup>1</sup> detailed or assigned thereto, without additional compensation, by the Secretaries of War and Navy in such number as they may determine." The commission is obliged to "advise and consult with the committee on all atomic energy matters which the committee deems to relate to military applications" and to keep the committee fully informed of all such matters before it. The committee is also obliged to keep the commission fully informed of all atomic energy activities of the War and Navy Departments. The committee is further empowered to bring to the attention of the Secretaries of War and Navy any action or proposed action on the part of the commission which is deemed adversely to affect the discharge of the responsibilities of their departments.

This very broad provision for exchange of significant information clearly sets forth the pattern of working relationships which must be maintained between the civilian commission and the armed forces. The procedure for carrying disputes arising out of these relationships to the Secretaries of War and Navy and through then to the President is important. These provisions met with the approval of the Secretaries of War and Navy, who testified in favor of the McMahon bill in all its essential features.

6. The provision of a bipartisan congressional Joint Committee on Atomic Energy empowered to make studies on its own initiative, review legislation, hold hearings, appoint staff and consultants, report to the Congress, and "keep fully and currently informed with respect to the commission's activities." The provision of this unusual vehicle of coordination between operating policy developed by the commission and legislative policy is clearly an outgrowth of concern that the ordinary congressional controls secured through voting appropriations, reporting, and similar services were not enough. The creation of the joint com-

<sup>1</sup> Now modified by passage of the National Security Act of 1947.

mittee, with its broad powers to perform continuously on behalf of congressional interests, assured the legislators that no great hiatus need develop between operating policy and congressional policy.

7. Other major statutory provisions bear directly on organization and administration of commission activities.

(a) *Methods of performing work.*—The statute provides the commission with broad powers to administer directly or secure through contracts such research, development, and production services as it requires.

(b) *Advisory boards.*—The commission has broad powers to establish advisory boards on any phase of operations, policy, or legislation.

(c) *Personnel.*—The statute provides that officers and employees "shall be appointed in accordance with the civil service laws and their compensation fixed in accordance with the Classification Act of 1923, as amended, except that to the extent the Commission deems such action necessary to the discharge of its responsibilities, personnel may be employed and their compensation fixed without regard to such laws." Congress clearly anticipated that the agency responsible for the development of this new field would encounter problems of internal management which would require flexibility, originality of approach, and freedom from complete conformity to normal governmental personnel regulations and practices.

(d) *Reports to Congress.*—Reports to Congress are of two types—those to be submitted semiannually on all aspects of commission operations and those which are concerned with the utilization of atomic energy. In connection with the latter Congress has specified that "whenever in its opinion any industrial, commercial, or other nonmilitary use of fissionable material or atomic energy has been sufficiently developed to be of practical value, the commission shall prepare a report to the President stating all the facts with respect to such use, the commission's estimate of the social, political, economic, and international effects of such use and the commission's recommendations for necessary or desirable supplemental legislation."

(e) *Other provisions.*—Other important statutory provisions having a bearing on administration cover (1) control of information, (2) compensation for patents, (3) licensing of source material, (4) ownership and procurement of fissionable and raw materials, and (5) a number of other provisions which permit the commission to administer its affairs with considerable flexibility.

In the light of the complexity and public importance of atomic energy, Congress recognized the need for the orderly amendment of the Atomic Energy Act of 1946. To date no revisions in the statute have been made. Under a rider to the 1948 Independent Offices Act, however, the commission was denied authority to except some management positions from the Classification Act salary ceiling.

#### TIME SCALES AND MAGNITUDES

In the development of atomic energy so many great events have been crowded into so short a period that it is useful to review briefly the time relationships and magnitudes of operations that have shaped the nation's program. The following highly selective time schedule is a reminder of events having particular importance for understanding the organization and administration for atomic energy development and control:

(a) June 1940–August 1942, development of plans and organization for the production of atomic weapons, starting with the National Defense Research Committee and culminating in the establishment of the Manhattan Engineer District.

(b) July 16, 1945, exploding of test bomb at Alamogordo, New Mexico.

(c) August 6 and August 9, 1945, dropping of bombs on Hiroshima and Nagasaki.

(d) December 1945–August 1, 1946, legislative hearings, ending in the passage of the Atomic Energy Act of 1946.

(e) October 28, 1946, interim appointment of five commissioners.

(f) December 30, 1946, interim appointment of the general manager.

(g) January 1, 1947, transfer of properties and responsibility for administration of the program from the Manhattan District of the Army Engineers to the commission.

(h) January 15, 1947, nomination of commissioners and general manager.

(i) April 9, 1947, confirmation of commissioners and the general manager by the Senate.

Magnitudes of commission operations which indicate something of the size of the organization and volume of operations are given in the following key statistics:

## (a) Full-time civilian employees:

1. Washington AEC staff as of Jan. 31, 1948.....	535
2. Field AEC staff as of Jan. 31, 1948.....	4, 162
3. Contractor employees as of Dec. 31, 1947.....	50, 231

## (b) Estimated budget obligations for fiscal 1948 (subject to revision):

1. Procurement, production, and processing.....	\$204, 310, 467
2. Research and development.....	76, 054, 077
3. Construction activities.....	340, 982, 072
4. Operation of community facilities.....	33, 730, 139
5. Operation of field offices.....	23, 132, 886
6. Operation of Washington office.....	4, 577, 500

Total..... 682, 787, 141

## ORGANIZATION AND INTERNAL FUNCTIONING OF THE COMMISSION

The commission officially took over the organization and operation of the war-created Manhattan District of the Army Engineers on January 1, 1947. Approximately 4,000 civilians, 235 military officers, and 2,500 enlisted men were in the Manhattan District; there were an additional 40,000 in the employ of contractors. The district had a small liaison and control office in Washington. The operating headquarters office was located at Oak Ridge, Tennessee, with principal centers of operation at New York City, Chicago, Richland, Washington, and Los Alamos, New Mexico. Smaller offices were located at Berkeley and Los Angeles, California, Ames, Iowa, and Schenectady, New York. The operations were fairly highly centralized. Because of the single objective of the district and the almost complete secrecy of its operations, a number of the management services such as budget, legal, and public information were not very well developed. The heavy reliance on military personnel for the key administrative, technical, and supervisory positions depressed, by comparison with civilian governmental organizations, the importance of the civilian personnel office.

The first urgent organization and personnel jobs of the commission under a much broadened and more complex peacetime charter were clear cut. They were (a) to transfer all personnel, delegations, properties, etc., from the Manhattan District to the Atomic Energy Commission, a transfer that was accomplished without any interruptions; (b) to build in Washington around the four statutory program divisions and the management offices the staff organizations necessary to put the commission and the general manager in a position to assume administrative direction of the giant enterprise which they inherited; (c) to establish the office of the general manager and develop effective working relationships with the commission and the staff; and (d) to recast the operating field organization in terms of greater decentralization, broadened functions, and civilian leadership.

These tasks were accomplished largely (a) through the active cooperation of the key military officials of the Manhattan District, who continued to assist the commission as needed—some through February 1, 1947, many until June 1947, and a very few until September 1947; and (b) through the establishment of the office of field operations headed by the former director of operations, who kept the going organization intact while the decentralized offices were being established and the civilian operating managers recruited.

*The Commission.*—The organization of the offices of the five commissioners reflects the fact that the commission acts exclusively as a policy board. The commission looks primarily to the general manager and through him to the rest of the organization for any information and judgment which they need to discharge their policy-making functions. The staff of their offices is limited, therefore, to secretarial and administrative assistant personnel.

Until recently, the commissioners, while becoming fully acquainted with a myriad of complex policy problems, have been in session almost daily. Regular meetings are now scheduled for three days each week for action on current business brought to the commission's attention by the general manager, for their own executive sessions, for informal meetings with individual managers and directors, and for conferences with the Military Liaison Committee. Additional meetings are held with the Joint Congressional Committee on Atomic Energy, representatives of other governmental agencies, and other organizations as required. Some unscheduled time is thus available to commissioners for individual work, planning, and policy interpretation.

As a matter of administrative practice, commission meetings are attended by the general manager, secretary, general counsel, recording secretary, and staff members who have taken primary responsibility for preparing the staff papers which are the substance of the agenda.

*The Office of the General Manager.*—Because the general manager is convinced that the principal technical and managerial strength of the organization must be located in the offices of the field managers and directors of staff divisions and offices, he has limited his immediate staff to persons concerned exclusively with coordination and special assignments: an assistant general manager, an assistant to and a special assistant to the general manager, the executive officer of the program council, and the secretary of the commission. The functioning of most of these staff members will be described in the discussion of the coordinative machinery of the commission.

The commission has authorized and directed the general manager to discharge personally, or to delegate to others responsibility for discharging, those executive and administrative functions necessary to carry out the provisions of the Atomic Energy Act of 1946. The general manager thus is responsible for the internal management of the commission under broad commission policies, subject only to such prior review of his managerial decisions as he elects. As a matter of working relationships, considerable formal and informal collaboration is obtained on such important managerial determinations as the making of major personnel appointments, the negotiation of major contracts, the solution of complex labor relations problems, and similar matters.

Although the major lines of demarcation between policy determinations and managerial determinations are understood and faithfully adhered to, the working organization is sufficiently flexible to allow for informality of relationships in the exchange of judgment on important items of mutual interest.

*The Program Divisions.*—For long-range program planning and staff judgment on the technical and scientific aspects of the program the general manager and the commission rely largely upon the directors of the four divisions created by statute (research, engineering, military application, and production) and the two divisions created by the commission (raw materials and biology and medicine). The assignment of functions and delegation of authority to each of the directors is broad. Particularly close interrelations between the divisions are specifically set forth to aid in effecting a correspondingly close integration of effort. All of the divisions are small, the maximum number of professional personnel in the largest being seventeen, thus making possible an informal give and take of professional judgment which is essential for the development of coordinated staff policies. More formal coordination is achieved through the operations of the program council which is described later in this article. All of the directors report to the general manager and as members of the general manager's staff have responsibility for participating in the evaluation of policies for the direction and appraisal of all aspects of the program. Specific obligations are placed upon the directors for keeping the director of military application apprised of developments which have a bearing in his field. The effective working of this simple requirement has made it unnecessary for the director of military application to staff his division with liaison informational personnel to assure himself that he learns of important developments.

Directors and their staffs are authorized to have the direct informational exchanges necessary for effective program planning and assistance on current operations with their counterparts on the staffs of AEC managers and contractors. Policy direction can be given on behalf of the general manager or in his name depending upon the judgment of the director and the general manager as to the importance of the directive. Generally speaking, paper directives have been kept to a minimum. In cooperation with the director of budgets, directors of divisions review program budgets and testify on program matters before the Bureau of the Budget and committees of Congress.

Most of the program problems brought before the General Advisory Committee for review and appraisal have had prior consideration by the program council.

*Management Offices.*—Organization units concerned with staff work and management policies are called offices. The offices are: security and intelligence, organization and personnel, budgets, comptroller, general counsel, public and technical information service, and administrative operations. The general counsel and the comptroller in addition to reporting directly to the general manager on all matters of regular business are expected on occasion, as required, to report directly to the commission. Most of the judgment of these two office heads, like that of the

directors, is presented in staff papers prepared by staff members of other divisions and offices and submitted by the general manager to the commission. The coordination of congressional relations is centered organizationally in the office of the general counsel. As a matter of operating procedure, however, all members of the staff are expected to work with the Joint Committee and its staff.

The director of the office of security and intelligence has particularly close relations with the general manager and the commission on complex questions of security. On difficult borderline cases of personnel security, the commission is assisted by a special Personnel Security Review Board composed of Ex-Justice Owen J. Roberts, Karl T. Compton, Ex-Ambassador Joseph Grew, George M. Humphrey, and H. W. Prentis, Jr.

Directors of offices perform in their respective spheres in much the same manner as directors of program divisions. They all report to the general manager, issue instructions by his authority or in his name as necessary, conduct their relationships with their counterpart staffs of managers of operations and contractors in much the same manner as directors of divisions, and are broadly responsible as members of the general manager's staff for participation in policy development and administration generally.

Staff coordination between offices, divisions, and the field offices of directed operations is effected through the assistant general manager, whose functions will be described more completely in the section on internal coordination.

With the exception of those offices required to perform services for Washington operations such as security and intelligence, organization and personnel, administrative operations, and to a lesser degree the office of the comptroller, these organizations are of extremely small size, being limited in their responsibility to the development of programs and policies and the creation of standards and operating guides.

#### OFFICES OF DIRECTED OPERATIONS

Responsibility for supervising the operations of the Atomic Energy Commission is delegated to the managers of five highly decentralized field offices which are organized on the basis largely of functions. All of these managers report directly to the general manager. They are responsible for the supervision of the AEC field organizations which negotiate contracts and provide policy direction, control, and assistance within the broad framework of commission policy to research, engineering, production, construction, and other contractors who do almost all of the actual operational work of the commission. Managers of directed operations have varying authority, depending upon the functions being carried out under their direction, to enter into contracts ranging from two to five million dollars for each contract on programs which have been approved by the general manager. They are obliged to bring only those operational problems to the attention of the general manager which raise new policy problems of a very complex nature or which are likely to affect the work of the entire organization.

In addition to their authority to contract, managers have broad delegations of authority to:

(a) Establish positions and make appointments, subject to general security restrictions. Exceptions to this broad grant include only those personnel actions affecting (1) persons appointed to positions involving principal supervisory responsibility for major functional units having counterparts in staff divisions and offices in Washington, (2) employees whose duties require professional legal training, and (3) persons appointed by contractors to positions at annual salaries of \$15,000 or above. The first two limitations on the delegation of appointing authority are intended merely to secure essential concurrence between managers and directors of divisions and offices on top staff. This concurrence is necessary to assure effective informal working relationships between operating and staff personnel responsible for staff policies and operating practices in the same fields of endeavor. The temptation to resort to more formal practices and cumbersome procedures is thus substantially diminished.

(b) Issue certificates and licenses where appropriate, develop instructions, and take all other administrative actions necessary for the performance of the assigned functions unless clearly inconsistent with the limited number of the directives and instructions of the general manager.

In general, the organization of each of the offices of directed operations parallels closely, but not uniformly, the organization of the Washington office, thus making it possible to conduct the business of the commission with a minimum of organizational complications or barriers. Such differences as exist reflect the responsibility

which field offices have for direct dealings with contractor organizations. Only major organizational changes require prior approval of the general manager.

In addition to their responsibility for direct supervision of the operations of the commission, managers of directed operations are considered to be members of the general manager staff *in absentia* and as such share responsibility for the development of commission policy and the effective and economical administration of directly administered and contract activity. A brief sketch of the program of each of the offices of directed operations follows:

*New York.*—The office of New York directed operations was established on June 9, 1947. This office, under the direction of the manager of New York directed operations, is authorized to administer the following principal functions:

1. Receive and warehouse source material and procure other materials as required.
2. Direct all phases of the commercial production of uranium and thorium metals, and certain compounds and special materials for AEC installations in accordance with approved AEC programs.
3. Negotiate and direct the administration of the contract provisions of all construction and related contracts entered into or assigned to the New York office.
4. Administer research contracts, including that of the Brookhaven National Laboratory.
5. Locate and negotiate with contractors for the development and manufacture of certain special materials and engineering equipment for use at other AEC installations.
6. Administer the system of source material licensing established by the commission.

*Oak Ridge (Tennessee).*—The office of Oak Ridge directed operations was established on September 15, 1947. The principal functions of this office are to:

1. Direct the operation and maintenance of plants and facilities for the production of fissionable and related materials to meet schedules under programs approved by the general manager. These research, engineering, development, and supply plants and facilities are located at Oak Ridge, Tennessee; Miamisburg, Ohio, and elsewhere.
2. Direct and design the construction of plants and facilities as may be required.
3. Administer research and development contracts including the Oak Ridge Institute for Nuclear Studies.
4. Administer the AEC program for the production and distribution of radioactive and stable isotopes.
5. Direct the construction, maintenance, and administration of housing and community facilities for the town of Oak Ridge which has a population of approximately 36,000 persons.

*Chicago.*—The office of Chicago directed operations was established on August 31, 1947. The principal functions of this office are to:

1. Administer research and development contracts for work performed at the Argonne National Laboratory. The work of this laboratory is focused chiefly on problems of reactor development, with fundamental supporting research on relevant problems in chemistry, physics, metallurgy, medicine, and biology.
2. Direct the contractors responsible for the design and construction of buildings and facilities authorized for the new Argonne National Laboratory and such other authorized buildings and facilities as are needed for the program.
3. Administer research and development contracts for work performed at Iowa State College.
4. Administer research and development contracts for work at the University of California at Berkeley concerned with research in nuclear physics, high-energy accelerators, chemistry, biology, and medicine.

*Santa Fe (Los Alamos, N. Mex.).*—The office of Santa Fe directed operations was established as of July 2, 1947. This office manages contracts for atomic research, for developmental engineering, and for the construction and maintenance of facilities for the production of atomic weapons. One of the more important facilities is the town of Los Alamos which has a population of approximately 8,600 persons.

*Hanford (Richland, Wash.).*—The office of Hanford directed operations was established as of September 1, 1947. The principal functions carried out under the authority of this office are:

1. The manufacture of plutonium and other products at Hanford and at other locations directed from Hanford.
2. The administration of research contract activities at Hanford directed toward improvement of operations.

3. The construction of new and the operation and maintenance of existing production, research, and community facilities at Hanford.

4. The direction of research activities at the Knolls Atomic Power Laboratory and other research at Schenectady, New York. Most of this work is administered by the same prime contractor which administers the work at Hanford.

5. The construction of new and the operation and maintenance of existing laboratory and other facilities for the Knolls Atomic Power Laboratory at Schenectady, New York.

6. The management of the town of Richland, Washington, which has a population of approximately 17,000 persons.

*Eniwetok Proving Ground.*—The commission is developing a proving ground for atomic weapons in Eniwetok Atoll in the South Pacific.

#### INTERNAL COORDINATIVE MACHINERY

The organization of the Atomic Energy Commission runs counter to many textbook concepts and conventionally espoused administrative principles. An important concept which appears to be violated in the AEC is the number of persons reporting to the general manager. There are twenty-three such persons in the AEC: five managers of operations; six division directors; seven office directors; and five members of his immediate staff. The successful maintenance of this simple organization arrangement, with its structural and personnel advantages, depends upon three important requirements:

1. The essential willingness of the general manager to delegate responsibility.
2. The quality of the top staff—with particular consideration of capacities for self-coordination and self-direction, which have an important bearing on the frequency and method of reporting to the general manager.
3. The functioning of effective coordinative machinery.

The first condition, namely, the willingness of the general manager to delegate responsibility, is clearly demonstrated in all that has been reported thus far. The second point will have to rest in this article with the assertion that there is a high correlation between the creation of a basically simple organization and highly responsible top personnel. There follows an abbreviated account of the coordinative machinery employed by the general manager.

*Coordination of Program Matters.*—Most program-planning work and the development of current program policy involve several divisions. The program council is designed to secure coordinated judgment on matters affecting the soundness of program planning and execution. The active members are the general manager, the directors of the divisions of research, production, military application, and engineering, and the assistant general manager. The general manager acts as chairman; each division director serves by rotation in the capacity of vice chairman to conduct the business of the council in the general manager's absence. The assistant general manager serves as a member of the council with particular responsibility for early identification of administrative problems which may arise in connection with the implementation of program policy. The directors of the divisions of biology and medicine and raw materials, and the assistant to the general manager, who aids the general manager directly on program matters, are also in the council and participate in its activities to the extent that their fields of interest are involved. The executive officer of the council is the key to the administrative effectiveness of the body. He plans the agenda, keeps the minutes, carries on many of the preparatory conferences, and otherwise keeps the council operating effectively.

The council meets regularly twice each week and has as many additional sessions as necessary. No program matter is brought to the attention of the commission without clearance through the council.

*Assistant General Manager.*—The duties of the assistant general manager for assistance in program coordination have already been described. In addition to these duties the assistant general manager is principally responsible for (1) coordinating and integrating the activities and relationships among the offices of organization and personnel, budget, comptroller, general counsel, public and technical information service, and administrative operations; (2) coordinating contracts initiated in Washington or referred by managers of directed operations and developing standards affecting contract negotiation and administration; (3) advising the general manager regarding problems requiring more extensive analysis and coordination which can be performed by the assistant to or special assistant to the general manager, by consultants, or by other means; and (4) making referrals of mail and other communications to the general manager, executive officer of

the program council, the secretary, managers, and directors for handling in accordance with assigned duties and keeping necessary control records on these referrals.

*Commission Secretary.*—The secretary of the commission assists the general manager on all matters affecting his formal relationship with the commission. With the exception of executive sessions of the commission the agenda of commission meetings are the agenda of the general manager. The secretary develops these agenda and gives staff assistance to the rest of the organization in the preparation of the formal staff papers which serve as the vehicles for putting complex problems and recommended solutions before the commission. The secretary keeps all the necessary records and minutes of commission actions. As a direct aid to the general manager and the staff he prepares summaries of commission actions, pending determinations, and other control records.

*Other Coordinative Devices.*—In addition to the organizational units directly concerned with assisting the general manager in performing his coordinative responsibilities, the following devices are used: (1) weekly meetings of the Washington staff, (2) meetings of managers and principal Washington staff at approximately quarterly intervals, (3) policy manuals and instructions, (4) communications of the secretariat, and (5) other communications.

#### THE ROLE OF ADVISORY COMMITTEES

The legislative history of the Atomic Energy Act of 1946 clearly reveals the tremendous impression made on the minds of congressmen by the stream of witnesses who pointed out the great complexities associated with guiding the young but prematurely husky infant known as atomic energy. Congress was presented with a great temptation to translate this complexity into cumbersome organizational forms. The more fortunate distillation of its judgment expressed itself in the creation of three statutory advisory bodies and the authorization of such additional advisory bodies as the commission might see fit to create. The following notes constitute a brief discussion of the utilization of advisory bodies by the commission.

##### *Statutory Bodies*

1. *General Advisory Committee.*—The nine distinguished members of the General Advisory Committee are presidentially appointed for six-year terms. Although constituted within the general framework of the AEC organization, the GAC enjoys a healthy objectivity and independence with reference to the commission as such. The committee has its own secretary who is not an employee of the commission. The agenda for committee meetings is developed out of suggestions from the general manager and commission staff—principally from the program divisions but not limited thereto—and from suggestions made by the committee's own members who are very familiar with various phases of atomic energy developed before and since the creation of the commission. The commission's appraisal of the GAC is indicated in the following quotation from the Third Semiannual Report to the Congress:

"\* \* \* Not only has the General Advisory Committee assisted in the solution of specific problems, it has provided a most helpful evaluation service in the reorientation of research and development programs. As a result of its own surveys and studies, the committee has recommended specific projects and made suggestions to strengthen the program at several points."

Although obliged to meet only four times a year, the full committee met formally eight times during the past year. In addition, there were many meetings of subcommittees and special surveys by individual members.

2. *Joint Committee on Atomic Energy.*—The eighteen-member Joint Committee on Atomic Energy was established by the Congress as its own device to receive full reports on commission activities on a current and continuing basis, including the reporting of secret matters. The recognition of the especially complex character of atomic energy and the necessity for secrecy in connection with many of its most important operations, plus an acute awareness of the difficulty of legislating with any degree of finality on atomic energy matters, doubtless motivated Congress to take this unprecedented measure to keep itself informed.

Members of the committee and the commission have frequently discussed many matters relating to the commission's activities in both formal and informal meetings. Representatives of other agencies of the government, such as the State Department and the National Military Establishment, have also participated in some of these meetings. The commission has also informed the committee of its activities by means of many letters, memoranda, and written reports. In

addition, members of the committee and the committee staff have visited the major installations of the commission throughout the country. No amendments to the Atomic Energy Act of 1946 have been passed, although a few bills have been introduced. The committee has a staff of nine professional persons and a budget for fiscal 1948 of \$150,000.

*3. Military Liaison Committee.*—The commission's Third Semiannual Report to the Congress succinctly summarizes the operating relationship between the commission and the MLC as follows:

The commission meets regularly with the Military Liaison Committee on alternate Wednesdays and oftener when required, and the staffs of both work closely together. The committee is housed in the commission's headquarters. Twenty-two formal joint conferences were held during the year, 14 of these since July 1, 1947, and there were numerous staff and informal conferences. Working relationships were maintained with the armed services at various levels in Washington and in the field and were much broader than the activities involved in establishing and meeting military requirements.

The mutual interests of the commission and the services extend throughout the broadest range of subjects: Security of information and facilities, production, procurement, construction of facilities, biology and medicine, certain field operations, intelligence, support of basic research, appropriations and other fiscal matters, export controls, mobilization planning, and participation of industry in the atomic energy program. Organizing for effective relations with the Military Establishment in these many fields—relations which recognized the responsibilities, explicit and implied, of the commission and the services—was a major objective of the commission during 1947, and progress toward this objective has been substantial, in a year which was a formative period for the commission and a period of reorganization for the services.

Differences arising in initial presentation of matters considered jointly have thus far been resolved by discussion and through analysis by the members and staffs of the Military Liaison Committee and the commission. Of the wide range of matters relating to the entire atomic energy program that have been discussed with the Military Liaison Committee, no case has yet arisen where it has been necessary to refer any disagreement to the President for decision as provided for in section 2 (c) of the Atomic Energy Act.

#### *Advisory Committees Established by the Commission*

The following listing of advisory committees suggests something of the scope of the program and of the effort on the part of the commission to secure widespread participation in the development of program and administrative policy. Each committee, whether permanent or ad hoc, is composed of persons who have distinguished themselves in the particular fields in which advisory recommendations are made. The interested reader is referred to the Third Semiannual Report of the Commission to the Congress for a more complete record of the scope and membership of these committees.

1. Advisory Committee for Biology and Medicine
2. Advisory Committee for Exploration and Mining
3. Patent Administration and Patent Advisory Panel
4. Industrial Advisory Group
5. Safety and Industrial Health Advisory Board
6. Advisory Board on Relationship of the Atomic Energy Commission with its Contractors
7. Committee on Scientific Personnel
8. Committee on Isotope Distribution

#### ORGANIZATION AND ADMINISTRATION—THE CONTINUING PROBLEMS

The first year of the nation's peacetime development of atomic energy has afforded heartening evidence of the soundness of the legal structure created by the Congress in the Atomic Energy Act of 1946. Under its provisions the commission has been able to construct an organization and an administrative machinery which is both strong and flexible in operation.

Strength and flexibility have been essential from the start and will continue to be essential. The unprecedented problems of atomic energy development, the size and complexity of operations, and the urgent time schedule of the program in both production and research demand an organization that can act positively and decisively on a nation-wide scale. At the same time, the organization must be acutely self-critical—vigilant in detecting unworkable policies or administrative

devices and quick to make improvements, whether they are called for by errors in original determinations or by unpredictable changes in circumstance.

To meet these operational demands, the commission has chosen to combine wide delegation of authority for operations with an alert and sensitive centralized staff organization. The continued workability of the organization as now conceived will be tested by:

1. The continued basic soundness of the commission determination to have all or almost all of the operations of the AEC carried on by contractors;
2. The continued effectiveness of the field organization to give useful direction to the work of contractors;
3. The continued and quickened development of basic program and management policies and standards by Washington divisions and offices to guide the operational direction of contractors by the AEC field staff; and
4. The continued effective integration of program policy and operational needs at the level of the general manager and the commission—incorporating at this level the advice of top military, congressional, and scientific bodies.

The continued effectiveness of the commission's staff and organization is now, and will be in the future, tested in the crucible of intensive internal and external scrutiny. No agency has ever been put to such severe tests. It is necessary for the public welfare that the tests be focused exclusively on the achievement of results.

Mr. LILIENTHAL. I did not understand what your assumption was, that it was written with the approval——

Senator HICKENLOOPER. I assume that inasmuch as Mr. Niehoff, the author of the article, was assistant to the General Manager at the time, that his publication in this review was with the authorization and approval of his superiors.

Mr. LILIENTHAL. I do not know whether that is true or not. I just did not understand it.

Senator HICKENLOOPER. I am not stating it is true, I assume it. But I might ask, if you care to consult Mr. Wilson, the General Manager, if he knew about that article or in any way authorized it.

Mr. WILSON. The article was written by Mr. Niehoff; the views were his own; I reviewed it; I saw no objection to his publishing it.

Senator HICKENLOOPER. Fine.

Now, do you know Captain Huntington, a retired naval officer, who was the AEC manager of division at Sandia Base?

Mr. LILIENTHAL. I certainly must have met Captain Huntington, but I do not recall his name. I have been at Sandia Base.

Senator HICKENLOOPER. You do not know why or would have no way of knowing why at the moment he terminated his employment there?

Mr. LILIENTHAL. No. I assume someone was regarded as better fitted for that particular post who had been selected, but I do not know.

Senator HICKENLOOPER. You know the present manager at Sandia Base, the so-called Z Division?

Mr. LILIENTHAL. Yes.

Senator HICKENLOOPER. Captain Kraker, also United States Navy, retired; is that correct?

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. You have no way of evaluating at the moment Captain Huntington's loss or the Commission's gain in connection with his separation?

Mr. LILIENTHAL. No, sir; I assume before the hearings are completed, an evaluation of that whole Sandia enterprise will, I hope, be presented to you by the executive vice president of the Bell Laborato-

ries, who recently made a survey of it, and you will get then an outside and qualified appraisal of the whole undertaking, including—

Senator HICKENLOOPER. Are you acquainted with Mr. Ted Jensen, Chief of the Atomic Energy Construction Division at Los Alamos?

Mr. LILIENTHAL. I have met Mr. Jensen.

Senator HICKENLOOPER. Do you know when he quit his employment there?

Mr. LILIENTHAL. No, I do not, Senator.

Senator HICKENLOOPER. Do you have a new chief of construction at Los Alamos now?

Mr. LILIENTHAL. I am not offhand familiar with the answer to that question.

Senator HICKENLOOPER. Do you know the amount of construction in dollars currently going on at Los Alamos in the general program?

Mr. LILIENTHAL. Very large, I do not carry the figure in my head, but I can get it.

Senator HICKENLOOPER. There is no necessity for that, but it is probably in the neighborhood of \$150,000,000 in operation or more.

Are you acquainted with Dr. Philip Morse, who was Director of the Brookhaven Laboratories?

Mr. LILIENTHAL. I have met Dr. Morse and I knew him slightly.

Senator HICKENLOOPER. Do you recall when he terminated his employment as Director of the Brookhaven Laboratories?

Mr. LILIENTHAL. Not very long ago. I am advised that is exactly a year ago, last summer.

Senator HICKENLOOPER. Do you consider his termination of employment as a loss to the Brookhaven Laboratory?

Mr. LILIENTHAL. Here I have to depend on the judgment of those who were responsible for the Brookhaven Laboratories, the Trustees of Associated Universities, and they quite evidently thought there was an individual better qualified for that post and, therefore, the answer would probably be "No."

Senator HICKENLOOPER. I see.

Mr. LILIENTHAL. The Brookhaven Laboratory, as the Senator is aware, but others may not be, is not operated directly by the Commission, but by the Associated Universities, nine major universities of the Northeast; their governing board and management selected Dr. Morse in the first instance, and replaced him a year ago in the second instance.

Senator HICKENLOOPER. You are acquainted with Mr. Hood Worthington, who was a member of the General Advisory Committee?

Mr. LILIENTHAL. Yes, sir; I am.

Senator HICKENLOOPER. The General Advisory Committee is a very vital and important arm of the Commission?

Mr. LILIENTHAL. Yes.

Senator HICKENLOOPER. Composed of eminent men?

Mr. LILIENTHAL. That is correct, sir.

Senator HICKENLOOPER. How long has it been since Mr. Worthington resigned as a member of the Advisory Committee?

Mr. LILIENTHAL. His term expired, Senator, his term under Presidential appointment expired in August of last year.

Senator HICKENLOOPER. He was not reappointed. Do you know whether at his own request?

Mr. LILIENTHAL. It is my understanding he did not only not desire reappointment, I recall he very firmly did not desire appointment in the first place, but at his request, he was not considered, and Dr. Oliver Buckley, the director of the Bell Laboratories, was appointed by the President in his stead.

Senator HICKENLOOPER. The General Advisory Committee maintains a current fund of very vital information of the operations of the Commission in order to be better able to give advice to the Commission, does it not?

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. Do you know Mr. William Waymack?

Mr. LILIENTHAL. Yes.

Senator HICKENLOOPER. One of the Commissioners who resigned.

Mr. LILIENTHAL. Yes; I do.

Senator HICKENLOOPER. Last December, I believe. I believe Mr. Waymack you testified you had recommended for appointment to the Commission.

Mr. LILIENTHAL. That is correct, sir.

Senator HICKENLOOPER. Mr. Waymack, I take it, we consider to be, both of us consider to be, an able man.

Mr. LILIENTHAL. Yes. I think both of us do consider him that.

Senator HICKENLOOPER. Dr. Robert F. Bacher, a Commissioner, who I believe was the other one you recommended to the President for appointment, resigned a short time ago.

Mr. LILIENTHAL. As of May 9 or 10, I believe.

Senator HICKENLOOPER. And a few weeks ago new appointments were made in those cases and they are now confirmed.

Mr. LILIENTHAL. That is correct.

Senator HICKENLOOPER. Now, Mr. Chairman, I have tried to hurry on this matter to illustrate and develop the point that there has been a startling lack of continuity in key positions in the operation of the atomic energy program from the general administrative viewpoint in Washington.

I have here that I can run through very quickly—the committee may want to look at it further—I have here a statement of the employment and the terminations of the Commission since it was set up.

In the Fifth Semiannual Report of the Commission to the country in which the Commission says it is telling the country everything that can be told about the operation of the program, on page 121 I find this statement, and I quote:

The number of people employed by the Commission itself is small and the turn-over among them is relatively low.

Now, I want to be sure to make clear that I am not talking about the employees of the contractors, I am talking about the employees of the Atomic Energy Commission, who number somewhere in the neighborhood on an average of around 5,000 people, and I would like to read in summary—I have the figures here month by month, which I will not at this moment burden the record with, but I would like to read this statement, which is a compilation of the first 2 years.

This statement is based upon the Commission's reports to the joint committee.

In order that a continuing study may be made of the personnel situation of the Atomic Energy Commission, the joint committee early in 1947 requested a monthly report from the Commission

reflecting the strength, hires—that means the people hired, promotions, and terminations of all Federal employees of the Atomic Energy Commission.

Information has been received for 24 months beginning with January 1947 and concluding with December 1948.

An analysis of the information reveals the following:

Number of Federal civilian employees of the Commission as of the end of 1948 or as of January 1, 1949, was 4,971. The largest number of Federal civilian employees on the Commission pay roll at any one time was in August 1948 when the total was 5,010.

During the year 1947, 2,581 employees were separated for all causes. Since the highest number of employees at any one time in 1947 was 4,715, this makes a turn-over of 54 percent.

In 1948, 1,685 persons were separated for all causes, and since the highest number of employees at any one time in 1948 was 5,010, this was a turn-over of 33½ percent in the employment of the Commission.

In the 2-year period of the Commission's operations, 4,366 employees have been separated for all causes. The highest number of employees on the Commission's pay roll at any one time has been 5,010; which means that in the 2 years of operation the percentage of turn-over has been 87 percent of the total number.

In 1948 the highest number of employees at any one time, any one month, in the Washington headquarters was 986, and during the year 1948, 228 persons were separated for all causes, for a percentage turn-over in 1948 of 23 percent.

In the Offices of Directed Operations, the largest number of Federal employees was 4,185 in the year 1948. There were separations for all causes of 1,427, for 34 percent in that year.

In January 1948 Santa Fe Office of Directed Operations had 1,139 employees, and in December 1948, the same office had 1,314 employees, for an increase of 175 employees.

During 1948, 448 employees were separated for all reasons, for a percentage turn-over of 34 percent in the AEC in 1947—34 percent.

In the Atomic Energy Commission in 1947, 761 persons were separated under the category of reduction in force; yet, during the same 12-month period the total employees were increased from 4,103 to 4,715.

In 1948, 319 individuals were separated by reduction in force, and over the 2-year period there were 1,180; yet, the increase in personnel from January 1, 1947, to January 1, 1949, is 721, or a total increase of 17 percent.

In other words, I have the month-by-month records of separations or terminations, or as we call it—well, I think I should use the words “separations and terminations”—and those that were hired, and it shows this startling percentage turn-over among the almost 5,000 employees.

Now, I have taken the figure of 5,010 as the highest number at any time on the rolls, and I have not taken the average employment during 1947 and 1948. I believe if I took the average employment, the percentage of turn-over in total would, of course, be somewhat higher.

Now, Mr. Chairman, this morning in hurrying through I wanted to present this matter of what I believe to be administrative indecision and administrative noncontinuity as a basis, because administration depends upon human beings, administration depends upon ability,

and continuity of work, and the familiarity of people with their jobs; so at this point—I have transgressed a little longer than I thought I would on the time of the other members—so at this point I believe I will summarize this by saying that I believe at least what I have put in this morning is very ample and substantial evidence of lack of continuity in key positions in these important and vital areas and a lack of continuity in the ordinary personnel run of the Commission's operations.

I believe that I should now stop at this point and let other members pursue their own questions.

The CHAIRMAN. Mr. Lilienthal, have you any comment to make upon the figures which have just been read to you as indicating a turn-over of rather high proportions?

Mr. LILIENTHAL. Not at this time, and I assume we will have an opportunity to submit an analysis of these figures.

The CHAIRMAN. I think it would be very helpful if you would give us such an analysis and a break-down of the classifications in which the turn-over took place.

Mr. LILIENTHAL. Yes. I assume also an opportunity will be afforded at the proper time to make a statement of organization so as to provide a background for the criticisms that have been made this morning, and I think it would serve the interest of the atomic energy program and of the country as a whole if an opportunity were afforded to describe with examples the grave problems of the recruitment of able men, particularly from industry and universities, into the Government service or into the service of contractors in the atomic energy program, because this is one of the problems that I am sure from a legislative point of view the joint committee will want to consider in its report.

The CHAIRMAN. I want you to go ahead with it right now, because we are talking now about the rapid turn-over in the Commission. That is, Senator Hickenlooper has been emphasizing that, and, as he just summed it up, he believes there has been a lack of continuity in the top positions.

Now, from you, sir, let's have your explanation right now. This is the place for it, and I think this is the occasion for it. You can proceed.

Senator HICKENLOOPER. Mr. Chairman, if I may interrupt: I have the records here, which I would like to put in the record at this point, of the details and the numbers and the reasons and the classifications, if that is satisfactory.

The CHAIRMAN. Do you have the break-down?

Senator HICKENLOOPER. The break-down is right there in those documents.

The CHAIRMAN. Well, they will be put in the record.  
(The data referred to is as follows:)

Atomic Energy Commission, strength, hires, promotions, and terminations, January through October 1947

Month	Full time strength end of month	Hires	Promotions					Separations

Senator HICKENLOOPER. Mr. Chairman, I would like to have put in, for the sake of the record, two reports, one filed on January 30, 1948, which is a report of the joint committee, to the Congress; another filed on May 17, 1948, which is a majority report on S. 2589.

The CHAIRMAN. Without objection, it is so ordered.

(The reports referred to are as follows:)

[S. Rept. No. 850, 80th Cong., 2d sess.]

## DEVELOPMENT AND CONTROL OF ATOMIC ENERGY

### FIRST REPORT OF THE JOINT COMMITTEE ON ATOMIC ENERGY TO THE CONGRESS OF THE UNITED STATES

This report is submitted to the Congress by the Joint Committee on Atomic Energy in order to give the Members of Congress a brief outline of the general fields of activity of the joint committee from the time of its active organization, to date. The Atomic Energy Act of 1946 imposes strict injunctions of secrecy against revealing details or other information falling within the classification of restricted data and in order that these legal prohibitions be observed, it will be necessary to make this report in general terms.

Section 15 (b) of the Atomic Energy Act of 1946 (Public Law 585, 79th Cong.), among other provisions, states:

"The joint committee shall make continuing studies of the activities of the Atomic Energy Commission and of problems relating to the development, use, and control of atomic energy."

#### HISTORY OF THE ACT

Shortly after the first military use of the atomic bomb in August 1945, a number of proposals for exercise of control over the production, use, and development of atomic energy were introduced in both Houses of Congress. On October 3, 1945, the President sent a message to the Congress stressing the necessity of legislation. On October 29 the Senate adopted Senate Resolution 179 establishing the Special Committee on Atomic Energy, and all bills concerning atomic energy introduced in the Senate were referred to this committee. Bills concerning atomic energy introduced in the House were referred to the Military Affairs Committee. Both committees held open and executive hearings, receiving the testimony of a large number of witnesses in the scientific, technical, military, business, and Government fields.

Following weeks of discussion in the Senate special committee, S. 1717, introduced by Senator McMahon, chairman, was reported back to the Senate on April 19, 1946, as amended in committee. On June 1, the bill was passed by the Senate and was referred to the House Military Affairs Committee. After a number of amendments, this committee reported H. R. 5364 (S. 1717, as amended), which passed the House of Representatives on July 20 and went to conference. Here the bill was agreed upon in its final form and the conference report was accepted by both Houses on July 26. With the affixing of the President's signature on August 1, 1946, Public Law 585 came into force and effect.

With the enactment of this law, it was declared to be the policy of the people of the United States that—

"\* \* \* Subject at all times to the paramount objective of assuring the common defense and security, the development and utilization of atomic energy shall, so far as practicable, be directed toward improving the public welfare, increasing the standard of living, strengthening free competition in private enterprise, and promoting world peace."

Following the effective date of the act, the President, on October 28, 1946, announced the recess appointments of the members of the Atomic Energy Commission as follows:

David E. Lillienthal, Chairman

Robert F. Bacher

Sumner T. Pike

Lewis L. Strauss

William W. Waymack

These appointees took their oaths of office and assumed their duties on November 1, 1946, and it was directed by the President in Executive Order 9816 that title

to the properties of the Manhattan Engineer District be transferred to the Atomic Energy Commission effective midnight, December 31, 1946, and this was done.

On December 12, 1946, the President appointed, as provided by the act, members of the General Advisory Committee, as follows:

Dr. James B. Conant, president of Harvard University  
 Dr. Lee A. DuBridge, president of California Institute of Technology  
 Dr. J. Robert Oppenheimer, University of California  
 Dr. Enrico Fermi, University of Chicago  
 Dr. I. I. Rabi, Columbia University  
 Mr. Hartley Rowe, chief engineer of United Fruit Co.  
 Dr. Glenn T. Seaborg, University of California  
 Dr. Cyril S. Smith, University of Chicago  
 Mr. Hood Worthington, chief chemist of E. I. du Pont de Nemours & Co.

These appointments are not subject to Senate confirmation.

Thereafter, on January 4, 1947, Dr. J. R. Oppenheimer was named chairman of this General Advisory Committee.

On December 30, 1946, the President announced the recess appointment of Carroll L. Wilson, to be General Manager of the Commission, subject to Senate confirmation. The announcement of this appointment completed the Presidential appointees provided for in the act who are subject to Senate confirmation.

Pursuant to section 2 (c) of the act, the Secretary of War and the Secretary of Navy appointed, as representatives of their respective Departments, members of the Military Liaison Committee, as follows:

Lt. Gen. Lewis H. Brereton, United States Army, Chairman  
 Maj. Gen. Lunsford E. Oliver, United States Army  
 Col. John H. Hinds, United States Army  
 Rear Adm. Thorvald A. Salberg, United States Navy  
 Rear Adm. Ralph A. Ofstie, United States Navy  
 Rear Adm. William S. Parsons, United States Navy

On January 31, 1947, Maj. Gen. Lunsford E. Oliver was reassigned and Lt. Gen. Leslie R. Groves was appointed to this vacancy.

On August 2, 1946, the day of adjournment of the Seventy-ninth Congress, second session, the Joint Committee on Atomic Energy, as provided by the act, was appointed as follows:

By the President pro tempore of the Senate, Mr. McKellar, on the part of the Senate:

Mr. Brien McMahon, of Connecticut  
 Mr. Richard B. Russell, of Georgia  
 Mr. Edwin C. Johnson, of Colorado  
 Mr. Tom Connally, of Texas  
 Mr. Harry F. Byrd, of Virginia  
 Mr. Arthur H. Vandenberg, of Michigan  
 Mr. Eugene D. Millikin, of Colorado  
 Mr. Bourke B. Hickenlooper, of Iowa  
 Mr. William F. Knowland, of California

By the Speaker of the House, Mr. Rayburn, on the part of the House of Representatives:

Mr. R. Ewing Thomason, of Texas  
 Mr. Carl T. Durham, of North Carolina  
 Mr. Aime J. Forand, of Rhode Island  
 Mr. Chet Holifield, of California  
 Mr. Melvin Price, of Illinois  
 Mr. Charles H. Elston, of Ohio  
 Mr. J. Parnell Thomas, of New Jersey  
 Mr. Carl Hinshaw, of California  
 Mrs. Clare Boothe Luce, of Connecticut

This joint committee organized on August 2, 1946, and Senator McMahon was elected chairman and Representative Thomason, vice chairman.

On January 20, 1947, after the commencing of the Eightieth Congress, the Joint Committee on Atomic Energy was appointed as follows:

Mr. Bourke B. Hickenlooper, of Iowa  
 Mr. Arthur H. Vandenberg, of Michigan  
 Mr. Eugene D. Millikin, of Colorado  
 Mr. William F. Knowland, of California  
 Mr. John W. Bricker, of Ohio  
 Mr. Brien McMahon, of Connecticut  
 Mr. Richard B. Russell, of Georgia

Mr. Edwin C. Johnson, of Colorado  
Mr. Tom Connally, of Texas

By the Speaker of the House of Representatives, Mr. Martin, on the part of the House of Representatives:

Mr. W. Sterling Cole, of New York  
Mr. Charles H. Elston, of Ohio  
Mr. Carl Hinshaw, of California  
Mr. James E. Van Zandt, of Pennsylvania  
Mr. James T. Patterson, of Connecticut  
Mr. R. Ewing Thomason, of Texas  
Mr. Carl T. Durham, of North Carolina  
Mr. Chet Holifield, of California  
Mr. Melvin Price, of Illinois

The first meeting of the joint committee was held on January 21, 1947, at which time Senator Hickenlooper was elected chairman and Representative Cole, vice chairman. Later, upon his appointment to the Federal district court, Representative Thomason resigned from the House of Representatives and Representative Lyndon B. Johnson, of Texas, was appointed by the Speaker to succeed him on the joint committee.

The Presidential nominations for the members of the Commission and the General Manager were referred to the Senate section of the joint committee on January 20, 1947. Hearings on these nominations were conducted by the Senate section of the joint committee over the period from January 27 through March 4, 1947, and consisted of 32 public sessions and 6 executive sessions. Fifty-five witnesses were heard and interrogated, including all of the nominees, and the committee afforded full opportunity to other Members of the Senate who were not members of the committee to request witnesses, to question witnesses, and to participate in the hearings.

At the conclusion of the hearings, the committee voted to and did recommend to the Senate that the Senate advise and consent to the appointment of all of the nominees and on April 9, 1947, they were confirmed by the Senate. Under the provisions of the act, the terms of the Commissioners will expire 2 years after August 1, 1946, which was the effective date of the act. The terms of each member of the Commission will eventually be 5 years, but the terms of the members appointed in 1948, when all present terms expire, are as follows: One Commissioner to be appointed for a period of 1 year; one Commissioner for a period of 2 years; one Commissioner for a period of 3 years; one Commissioner for a period of 4 years; and one Commissioner for a period of 5 years. Each of these terms expires on August 1 of the year in which the respective term ends, and as each term expires, an appointment for that position is to be made for a period of 5 years.

#### ACTIVITIES OF THE JOINT COMMITTEE

Section 15 of the Atomic Energy Act of 1946, among other provisions, defines the activities of the joint committee as follows:

"The joint committee shall make continuing studies of the activities of the Atomic Energy Commission and of problems relating to the development, use, and control of atomic energy. The Commission shall keep the joint committee fully and currently informed with respect to the Commission's activities. All bills, resolutions, and other matters in the Senate or the House of Representatives relating primarily to the Commission or to the development, use, or control of atomic energy shall be referred to the joint committee."

It also provides:

"The committee is authorized to utilize the services, information, facilities, and personnel of the departments and establishments of the Government."

Fully aware that the field of atomic energy is of vast significance to the people of the United States and of the world, and conscious of the unprecedented problems created by this revolutionary development of science, the committee members undertook, as their first activity, the task of familiarizing themselves with the general nature of this new field. It seemed axiomatic that there must be general comprehension of the nature of this complex subject before the committee could undertake to evaluate the activities of the Commission or to make future recommendations to the Congress.

Immediately subsequent to the confirmation of the Commissioners and the General Manager, the joint committee began a program of consultations and executive hearings with the Atomic Energy Commission and with other departments and agencies of the Government that have varying degrees of responsibility

in the program. These meetings have been held frequently and for the purpose of acquainting the committee with the operation of the program and policies of the Commission and to keep the committee informed with respect to the efficiency of the integration of the various activities and responsibilities of all departments and agencies of the Government in the advancement of the research and development of atomic energy in this country. These inquiries have, in general and in varying degrees of detail, covered the fields of over-all objectives, physical plant, security, production, personnel, materials, town management, labor, international objectives, health and biological programs, raw materials, weapons, industrial and agricultural prospects, military application, and other matters incident to these general fields.

Beginning with the organization of the committee, the selection of a staff was commenced. This staff now numbers 16 people and is set up under an Executive Director, a Deputy Director, and 4 sections—Information, Production, Security, and Development. Five members of the staff spend a substantial portion of their time visiting the various installations for inspection of activities coming within their particular fields, and they, together with other members of the staff, keep in constant touch with the Atomic Energy Commission through its headquarters staff. A constant liaison and flow of information from the field and the headquarters is maintained, designed to keep the joint committee "currently and fully informed." In addition, the committee maintains continuous liaison with the atomic energy representation of the United States at the United Nations headquarters, with one member of the staff in continuous assignment there.

It should be stated at this point that the joint committee does not attempt to pass judgment on specialized scientific or technical procedures involved in the program. The committee represents the legislative branch of the Government and is not equipped to be an authority in highly specialized fields of research or technology. Moreover, the committee has not assumed the responsibilities for administrative policies that are clearly vested in the Atomic Energy Commission under the act, but is attempting to gain as much information and knowledge from an over-all standpoint as will enable the committee to recommend, from time to time, any legislation that may be desirable and to keep abreast of the potentially changing needs and requirements of a tremendous program, that, without doubt, is still in its infancy.

Following numerous hearings and consultations by the committee between April and the 1st of August 1947, most of the committee members undertook inspection trips to the major physical installations of the Commission, such as those at Oak Ridge, Los Alamos, the radiation laboratory at Berkeley, the Hanford Works, the Argonne National Laboratory at Chicago, and some other installations. These inspections by committee members, based upon a background of information previously developed by studies, are invaluable in creating a more comprehensive understanding of the project and a first-hand view of the physical properties and the objectives and progress of this development.

The value of these inspection trips has proven itself in many ways. The sheer size and complexity of the plants and the diversity of the laboratory activities cannot be comprehended without personal observation. Information secured on these trips has helped provide the committee with factual background against which to evaluate progress. Many opportunities to acquire information and make independent appraisal of specific activities presented themselves. Such personal observation and inquiry provide an important means for independent judgment which the committee feels is essential to the fulfillment of its duties under the act.

Close liaison with key personnel of the Commission also has been maintained through continuous contact by the committee staff members with the Commission headquarters in Washington. Numerous conferences have been held with the chiefs of the statutory divisions, other division heads, and with personnel at varying levels within the organization, both in Washington and in the field. Periodic reports of these activities are made to the committee which keep the constantly developing picture available to its members.

The joint committee has also been aware of the importance of keeping fully informed of the progress of international purposes and plans for the control of atomic energy. For the achievement of this purpose, the committee maintains a staff representative at the United Nations who acts in the capacity of unofficial observer for the committee at the meetings of the United Nations Atomic Energy Commission. Studies have been made of the various proposals for international control, the working papers of the subcommittees and the progress of the negotiations. In this connection, the committee has also heard reports from the Under

Secretary of State and the deputy American delegate to the United Nations Atomic Energy Commission.

Besides the information which comes to the committee directly from personal inspections and conferences, from the Commission and from its own staff, committee members have examined and considered a vast quantity of information obtained from other sources. Staff members have carried on a continuous program of research, compilation, and analysis of unclassified information relating to scientific development, practical applications, international negotiations, and activities in foreign countries. This has made it possible for the committee to continue its educative program as well as to carry out the directive of the Atomic Energy Act to "make continuing studies \* \* \* of problems relating to the development, use, and control of atomic energy."

Much information of a classified nature, especially information relating to security, production, and military matters, has been presented to the committee in executive session. In addition to the Chairman and the Commissioners of the Atomic Energy Commission, witnesses appearing before the committee in executive session, have included the General Manager of the Commission, and his principal technical aids; the General Counsel; the Director of Security; Secretary of National Defense; Under Secretary of State Lovett; former Under Secretary of State Acheson; Dr. Frederick H. Osborn, deputy delegate to the United Nations; the Joint Chiefs of Staff; members of the Military Liaison Committee; the Director of the Central Intelligence Agency; Gen. Leslie R. Groves, Chief of the Armed Forces Special Weapons Project; Dr. Vannevar Bush, Director of the Research and Development Board; and Harry A. Winne, vice president in charge of engineering of the General Electric Co. Further meetings will be held periodically with these and other persons.

It is the considered conviction of the committee that, until such times as an effective, enforceable, and reliable program for the international control of atomic energy is in successful operation, the most vital business of the Atomic Energy Commission must be the meeting of the atomic requirements of national defense. Executive and administrative responsibility for adequately meeting these requirements is combined by law in the President, the Department of National Defense, and the Atomic Energy Commission.

The joint committee has been assured that those charged with these responsibilities are keenly aware thereof. This phase of the atomic energy program is of paramount and continuing interest to the joint committee and the committee considers that continuous knowledge and reassurance of the adequate discharge of these responsibilities is fundamentally necessary to its reliable evaluation of the general success of our program.

The concern which large segments of the public, the press, and Members of Congress have shown for the security of our atomic energy program, is shared most actively by the members of the joint committee.

The joint committee is informing itself as completely as possible on all phases of the vital problem of maintaining security in the whole field of atomic energy. The scope and ramifications of the security responsibility which faces the Atomic Energy Commission are tremendous. Clearance for employment of thousands of persons, physical protection of numerous plants, adequate safeguarding of production, as well as accounting for and protection of millions of restricted documents, are major problems of the security program.

Numerous visits have been made to the various facilities of the Commission for the specific purpose of observing the status of physical security at these installations. Such matters as physical protection afforded by fences and protective lighting; the qualifications, training, and efficiency of the guard force; the visitor control system; shipment security; document control; and the storage of restricted materials have been the subjects of intensive study.

The joint committee has reviewed the investigative files of the Atomic Energy Commission relative to the employees of the Commission and its contractors. In a number of these cases reviewed, certain questions were raised by the committee and the matters were discussed in detail with the Atomic Energy Commission and its security staff. (In certain of these cases, the committee has requested that the Commission outline in detail its security policy as applied to these specific instances. In the majority of these cases, the personnel involved had been employed during the time when the project was operated by the Manhattan Engineer District.) The committee feels strongly that it must continue to follow closely, as it has in the past, the type of personnel engaged in the atomic energy program. To this end the committee staff will continue to conduct these studies of the personnel investigative files of the Atomic Energy Commission. It is the

opinion of the committee that the matter of security of personnel is of extreme importance in the over-all problem of the protection of the vital aspects of this important program.

The joint committee has been assured by the Atomic Energy Commission that it is vitally concerned with the problem of personnel security and has recently established a Review Board, headed by former Associate Justice Owen J. Roberts, to assist it in establishing standards and criteria with regard to the employment of personnel in this program. In this connection, the Commission is increasing its efforts to assure itself that there will be no weak links in the chain. The Commission is mindful of the importance of guarding against losses of security through weaknesses or disloyalty of personnel. The Canadian incident involving Dr. Allen Nunn May is ample warning to all of us of the consequences of relaxed vigilance.

The intent of the Congress with regard to security is clearly indicated in the terms of the Atomic Energy Act of 1946. The joint committee is convinced that the Atomic Energy Commission is devoting continuous attention to the responsibility of carrying out this intent. It has inaugurated programs designed to strengthen security and to further protect the vital phases of the project.

While recognizing that the Atomic Energy Commission is unique among Federal agencies, the committee, nevertheless, is aware of parallels, in many of the Commission's production activities, with major American industries such as petroleum refining, heavy chemical production, construction and power equipment manufacture. It is, therefore, the policy of the committee to apply certain criteria applicable to private industry as yardsticks in studying the operations of the Commission.

To this end, the joint committee has requested from the Atomic Energy Commission a statement of its major programs in terms of present accomplishment and long-range forecasts for future activities. While the difficulties of formulating and stating such programs against a background of currently changing events are acknowledged, the committee believes it is impossible to examine current activities, expenditures, and programs intelligently without possessing a clear-cut definition of the aims of the Commission in discharging their responsibilities under the Atomic Energy Act. The first report has been received and is being studied. Subsequent reports will be received on a quarterly basis.

Inquiries are made on such matters as production; construction; contractor performance; town management; personnel policy; power development; radioisotope sales; medical, biological, agricultural, and basic research; fiscal policy; stock piling; export licensing; health and safety standards; and national research laboratories.

The relative importance of each of the above, and other subjects, to the joint committee's activities varies, but every effort is being made to integrate the total information so as to compose a relatively complete picture of atomic energy development today and in the months and years to come.

As a result of the threatened strike at Oak Ridge in November and December 1947, the joint committee has undertaken a thorough investigation of the important problem of a formula that will assure continuity of work in the atomic energy program. The committee is unanimous in its conviction that the national security demands uninterrupted operation of the critical facilities of the Atomic Energy Commission. Of the several operating production plants of the Atomic Energy Commission, Oak Ridge is the only one where labor is organized and bargains collectively for the production workers involved. The threat of a strike posed serious potential results as a consequence of interruption in the flow of materials from a possible shut-down of facilities and pointed up sharply the necessity for such an investigation. The committee expects to continue with its investigation and to recommend such action as its conclusions may justify.

#### LEGISLATION

The committee has heretofore requested, and the request is in continuous effect, from the Atomic Energy Commission and from the Secretary of Defense, that any problems which they believe to exist or are reasonably foreseeable in the future, and which may require legislation or alteration of the act, be suggested to the committee from time to time for study and recommendation. At the time of filing this report, no such suggestions or recommendations have been received. It is the opinion of the committee that sufficient time has not yet elapsed to warrant any conclusions as to whether or not additional or supplemental major legislation will be needed in the program but constant attention is given at all times to this subject.

## SUMMARY

The joint committee is a legislative committee which was created as a special servant of the Congress to follow this vast and complex program within the terms of the act. The joint committee does not at this time recommend to the Congress any major legislation affecting the policies or the philosophy of the act. As a legislative committee, it does not feel that it should at this time draw any final conclusions respecting the operation of this program or the administrative policies in effect. Sufficient time has not elapsed to warrant conclusions of this kind. This is not to be construed either as an attitude of hostility or an attitude of approval, but on the contrary expresses an attitude on the part of the committee to objectively evaluate the various phases of the program as a result of more mature opportunity.

The Nation is presently far ahead of any other nation in the over-all knowledge and development in the atomic energy field, and the joint committee believes that we must continue to maintain our preeminence in this field in the future.

Respectfully submitted.

THE JOINT COMMITTEE ON ATOMIC ENERGY,  
BOURKE B. HICKENLOOPER, *Chairman*.  
W. STERLING COLE, *Vice Chairman*.

---

[S. Rept. No. 1342, 80th Cong., 2d sess.]

#### PROVIDING FOR EXTENSION OF THE TERMS OF OFFICE OF THE PRESENT MEMBERS OF THE ATOMIC ENERGY COMMISSION

The Joint Committee on Atomic Energy, through the Senate members thereof, to whom was referred S. 2589, a bill to extend the time of the expiration date of the terms of the members of the Atomic Energy Commission from August 1, 1948, to June 30, 1950, report the bill back to the Senate with the recommendation that the bill do pass.

The atomic energy program was developed during World War II as a military project for the production of atomic weapons. They were successfully produced under military direction as a result of the unprecedented coordination of the highest degrees of scientific, engineering, and industrial skills ever mobilized.

In the process, startling and revolutionary scientific discoveries were made which suggested unlimited future possibilities for research and development in the field of social and humanitarian benefits. Complete emphasis, however, was placed on the development of a weapon and these other discoveries or possibilities were laid aside, at the time, for future investigation, research, and development in a peaceful atmosphere.

With the end of the war the problem of how to handle atomic energy for the good of mankind became paramount. It was universally agreed that the bomb must be secured, if possible, against international use in war, and this principle became a major consideration in all domestic approaches or suggestions to the problem. It also became a special and intensive problem of the United Nations within which a special Atomic Energy Commission was immediately set up with specific terms of reference directed toward a solution of this problem.

Meanwhile, the Congress commenced immediate studies for the purpose of passing proper legislation for the control and for the advancement and development of the limitless possibilities of this science. A special committee of the Senate and the Military Affairs Committee of the House over a period of months devoted time and held extensive hearings which eventually resulted in the passage of the Atomic Energy Act of 1946, approved by the President on August 1, 1946.

In considering the original legislation, the Congress, and eminent citizens who testified, recognized the pioneering nature of the project; the revolutionary power of the bomb; the perils of unrestricted tampering with the dangerous products of atomic fission and the possibilities of new and unforeseen dislocations in industry and social fields. The fact that there was no historical experience for guidance, when considered with other factors, indicated that any legislation and any program undoubtedly would be subject to future change as a result of mature experience.

In section 1 (A) of the act, it is clearly stated as follows:

"The effect of the use of atomic energy for civilian purposes upon the social, economic, and political structures of today cannot be determined. It is a field in which unknown factors are involved."

The declaration continues:

"Therefore, any legislation will necessarily be subject to revision from time to time. It is reasonable to anticipate, however, that tapping this new source of energy will cause profound changes in our present way of life."

In section 1 (B) (5), the law further states:

"A program of administration which will be consistent with the foregoing policies and with international arrangements made by the United States, and which will enable the Congress to be currently informed so as to take further legislative action as may hereafter be appropriate."

The report from the Senate Special Committee on Atomic Energy, which accompanied S. 1717, states:

"It is recognized that many unforeseeable developments may arise in this field requiring changes in the legislation from time to time."

The Congress recognized that under the provisions of the Atomic Energy Act of 1946, which placed this vast enterprise in the hands of a commission to operate, there was being created the greatest administrative monopoly with the most far-reaching power ever set up in this country; but there was no other course. The authority of this Commission is greater than any other commission or bureau either heretofore or presently established in government. It ramifies throughout industry, management, labor, and natural resources. Its authority extends into the international field of atomic energy. Because of the secrecy necessary to preserve the knowledge essential to the production of atomic weapons the operation of this vast set-up is clothed with restrictions and mandates for security, and the opportunity for public examination and evaluation of its progress and of the impact of its activities upon our normal peacetime or even potential wartime economy are nonexistent. This situation is unique in administrative policy of our Nation. It places solemn responsibility upon your joint committee.

The Atomic Energy Commission is presently operating on an annual basis of over \$600,000,000 in cash and \$300,000,000 in contract authorizations. It has unlimited discretion in the types and kinds of goods and raw materials it buys; it has complete control over the extent to which private enterprise may venture in this field; it preempts patents; it has full authority over all phases of production and activity in atomic energy; it has, subject to certain responsibilities of periodic direction by the President, complete discretion and control over the production of atomic weapons; it can make foreign contracts and arrangements; it can contract with State and local governments; it operates municipalities, is the landlord, and subsidizes many local services traditionally within the province of private enterprise; it has the duty of extensive participation in the fields of public health; it is authorized to participate and is participating in agricultural and industrial research and development and may give or withhold its aid in its discretion. Its broad powers enable it to establish and maintain countless programs which are not clearly defined. It employs, either directly or through its operating contractors, over 55,000 people who, with their families, probably total 200,000; it has discretionary authority over the release or the withholding of information affecting the program.

The Atomic Energy Commission, because of the nature of its duties and the extent of its powers, can exercise decisive control over the destiny of our Nation and the lives of our people.

The Congress, under the Atomic Energy Act, and in consideration of the inherent dangers and problems involved, deemed these broad powers essential for the protection of the public and in order to prevent if possible the devastating use of atomic weapons in war. In addition, these powers have been deemed initially essential in order that we may make the greatest progress and maintain our pre-eminence in the advancement of the science of atomic energy. Your committee refers to these powers therefor to illustrate the magnitude of the social and economic area within which atomic energy operates and to emphasize that its growth and integration into the American system of individual free enterprise must be carefully measured and that hasty decisions as to a permanent administrative pattern are unwarranted and unwise.

Because of the unprecedented monopolistic control of atomic energy set up in the Government through the Commission, the Congress, in section 15 of the act, created the Joint Committee on Atomic Energy composed of nine members of each House. This committee has a responsibility to—

"\* \* \* make continuing studies of the activities of the Atomic Energy Commission and of problems relating to the development, use, and control of atomic energy."

This section further provides that—

"The Commission shall keep the joint committee fully and currently informed with respect to the Commission's activities."

It was intended that by setting up such a joint committee, necessary secrecy of the project could be preserved, but at the same time a responsible body of Congress would be constantly kept informed so that it would be able, from time to time, to make such recommendations for legislation affecting the policy and operation of the atomic energy program, and to make such reports, as might be indicated in the public interest.

Although the law went into effect on August 1, 1946, the President did not appoint the members of the Commission until October 28, 1946, and the General Manager was not appointed until December 30, 1946. The transfer of the affairs of the Manhattan District (which was the wartime agency in charge of this project) to the Commission occurred on January 1, 1947. The nominations were sent to the Senate by the President on January 20, 1947, and thereafter beginning on January 27, a substantial portion of the time of the Commissioners and the General Manager was devoted to hearings on the question of the confirmation of their nominations until their confirmation on the 9th of April 1947. The first terms of the Commissioners were fixed by law for expiration 2 years after August 1, 1946, which was the effective date of the act.

In fixing the term of office for the first Commissioners at 2 years after the effective date of the act, it was the purpose of the Congress to provide at least a 2-year period for examination and observation of the program. The legislative intent to provide an initial 2-year term was predicated upon the sound reasoning that in an undertaking of this magnitude a minimum of 2 years would be necessary before any valid evaluation of the administrative policies could be made. These terms all expire on August 1, 1948. Since the Commission was not confirmed until the 9th day of April 1947 and from a practical standpoint has had uninterrupted and unquestioned security in the performance of its duties only since that time, it is obvious that there has been but 1 year for the reliable formulation of programs and for observation and study instead of the 2-year period wisely contemplated by the law.

The transition from the military operation to eventual full control by the Atomic Energy Commission was accompanied by many dislocations and uncertainties. Following the confirmation of the Commissioners, they and the joint committee undertook the coordination of their respective duties; on the one hand, the Commission went forward with plans for the development of their administrative policies under the act and, on the other, the joint committee began to inform itself and receive information as to the entire situation and the proposals for future development.

As noted before, the necessary activities of the Commission ramify throughout the general economy and the national policy of our Nation. It is a pioneering venture of a new, vast, and startling nature; there was no history or experience of a similar peacetime operation upon which the Commission or the joint committee could rely. In this year that has passed some programs have been set up and many policies considered, some of which have been adopted; many have remained under consideration without determination; others have been rejected. There has been some reorientation of attitude in connection with the setting up and expansion of these policies and programs. Not only have problems of personnel, science, industry, and labor been confronted, but many questions involving the interpretation of the act and the powers and responsibilities of the Commission have arisen.

Many of the key members of the Commission's staff have been employed in recent months in connection with the establishment of new policies and new administrative approaches. Many of the Commission's policies are in the process of formulation. Many of the plans of the Commission are on the drafting table. These are conditions to be reasonably expected. Fairness to the Commission dictates that additional time be allowed for the Commission to develop more definitely its administrative policies in order to justify conclusion as to the final direction of this program.

The Commission has just announced the recent test of an atomic weapon which is the culmination of researches and plans begun 3 to 4 years ago. The results of such progressive developments cannot now be adequately or properly evaluated as to their long-range effect upon the national needs.

In the field of patents, while the law sets up a framework for establishing a program for patent acquisition and compensation, no such program has as yet been finally established in this field hitherto sacred to the individual.

Recent events have shown that labor-management disputes in vital installations have threatened continuity of operation. In one instance a settlement was had 2 hours after the so-called deadline for a walk-out. At the time of filing this report, this same installation is again in the throes of a labor dispute and is presently operating as a result of injunction proceedings instituted under the Taft-Hartley Act. The effective period of that injunction is rapidly running out. The joint committee is determined that labor-management policies be reliably established so that continuity of operation can be assured in these vital plants. The joint committee has held hearings on this subject, but no satisfactory formula was presented or developed. The joint committee has asked the Atomic Energy Commission to provide it with its plans for the accomplishment of this purpose. The joint committee is aware that the Atomic Energy Commission is also vitally interested in the accomplishment of this purpose, but the Commission has not as yet developed its specific proposals for the reliable solution of this problem.

The Commission recently has begun to put into effect a changing theory of sectional operation of the program which is in the nature of decentralization. This method of operation may have much to recommend it but only experience can demonstrate whether or not it is a progressive move.

While many advisory groups have been set up by law and by the Commission, to give it advice and suggestions as to the development of pertinent phases of the atomic energy program, it is to be noted that the joint committee has received few reports of these advisory groups and, therefore, is in no position to reliably gauge either the extent of these recommendations or the degree to which such recommendations have been accepted and put into effect or held in abeyance, or rejected, by the Commission.

In a number of areas the joint committee has requested, from the Commission, and other vital coordinating agencies, information, conclusions, and recommendations which will aid in evaluating the national program and its operation. Information has not as yet been furnished to the joint committee enabling it to fully comprehend or determine long-range goals of production and operation policies of the Commission. This reference is not made by way of criticism but merely to indicate that the composite circumstances involved in our public affairs and within our economy create a certain indefiniteness that needs time and the unfolding of events before long-range policies can be fully justified.

It is to be noted that the Military Liaison Committee, the vital link between the defense establishments and the Atomic Energy Commission, has undergone a reorganization within very recent weeks. What the beneficial results of this action may be cannot be presently evaluated.

Due to the nature of the Commission's operation, its budgetary and accounting problems are ramified and very extensive. The accounting situation has been more complicated because of the fact that under previous wartime operation of this project necessitating complete secrecy, utmost speed, etc., standardized accounting procedures were not in effect; therefore, historic detailed costs are not fully available. A satisfactory system has not yet been set up. This fact is recognized by the Appropriations Committees of the Congress as well as by the Commission itself in its most recent report of February 2, 1948.

It is to be noted that, in addition to strict scientific and production activities of the Commission, it is involved, under existing policies, in the operation of cities and towns within the project. The problems of such operations are under serious consideration, both by the Commission and by the joint committee. Complicated problems of jurisdiction, of administrative authority, of voting rights, including prerogatives attendant upon residence, town management, court jurisdiction, heavy subsidies, schooling, public utilities, and other problems, demand careful and more mature experience and examination before any final policies with respect thereto can be adopted by the Congress or by the Commission.

A vital section of the efficient and progressive advancement of atomic science is the reactor program. Recently a basic change in the operation of this program has been decided upon and certain preliminary steps to effectuate this change have been undertaken. The operation of this proposed program will be and must be continuously under the most careful observation for a substantial period of time. Only experience can evaluate this move.

The importance of establishing satisfactory and adequate personnel programs in the operation of this project is evident. The necessity for security cannot be disputed. Policies for assuring the personnel security of the project under conditions of fairness to individuals but at the same time protecting inviolate the rights of the public and the integrity of this national venture, have been and still are in a state of study and trial. The Commission has been searching for a final

formula and the joint committee has been concerned with the necessity that a reliable formula be established.

The unsettled international situation has a direct effect upon the pattern of our atomic energy program. Had a satisfactory system of international control been established, certain provisions of the Atomic Energy Act, in due time, would have automatically become void and many vital powers of the Commission would have been transferred to an international agency. It is now conceded, however, after nearly 2 years of exhaustive effort in the United Nations, that satisfactory universal agreement for reliable international control of atomic energy is presently impossible. Only time and maturing events will enable us to determine the permanent direction of our administrative policies in this field.

It is important to emphasize that these matters which have been referred to are conditions which suggest the formative nature of our atomic energy program and by no means indicate a lack of progress. Further, they must not be interpreted as a criticism of the Commission or as evidence that the joint committee lacks confidence in the present Commission. Since the confirmation of the Commissioners on April 9, 1947, very definite progress has been made in our atomic energy program. This fact is encouraging but would in no way justify any hasty conclusions based upon insufficient knowledge as to the advisability of any particular permanent administrative pattern in this gigantic but infant national venture.

On January 30, 1948, your joint committee filed a unanimous report to each House of the Congress and, clearly recognizing the present inadequacy of the cumulative information and the definite need for continued examination before a final conclusion of any kind could be drawn about the long-range administration of this program, stated:

"As a legislative committee, it does not feel that it should at this time draw any final conclusions respecting the operation of this program or the administrative policies in effect. Sufficient time has not elapsed to warrant conclusions of this kind. This is not to be construed either as an attitude of hostility or an attitude of approval, but on the contrary expresses an attitude on the part of the committee to objectively evaluate the various phases of the program as a result of more mature opportunity."

The passage of this bill will immediately give assurance of uninterrupted continuity in office for 2 years and 2 months following the date of this report during which the present Commission can continue without disruption or without the necessity of reappointment. Any programs and policies now under way can be observed and brought into substantial operation; it will give approximately 2 years more for the over-all evaluation of the atomic energy program and its theory of operation. It will insure continuity and confidence and it will give assurance of continuity of operation and program upon which all employees, contractors, and consultants may rely.

The joint committee strongly emphasizes to the Congress that in the performance of its duty it has conducted, and intends to conduct, its business relating to atomic energy and to the Atomic Energy Commission on a totally nonpolitical basis. The joint committee unequivocally declares its determination to support the best and most progressive atomic energy program which can be developed to maintain our preeminence in this field. The committee has been guided, at all times, by one paramount principle and that is to maintain a course of conduct which will best serve to build confidence in, acceptance of, and support for a sound and vigorous atomic energy program. This is essential for the safety of the United States and for the peace of the world. It is in furtherance of this principle that your committee considered this legislation.

Your committee therefore recommends that the bill do pass.

Mr. PRICE. Mr. Chairman.

The CHAIRMAN. Just a minute, Mr. Price.

I would like to have Mr. Lilienthal, if he cares to, right now, comment upon the difficulties that the Commission has had, if any, in securing the kind of technical personnel and qualified personnel that it is imperatively necessary to have to run a commission of this kind.

Mr. LILIENTHAL. Let me say, first of all, that so far as the analysis of this detailed list of figures is concerned, that will have to await an opportunity to study it.

As far as the problem of continuity is concerned, this can best be illustrated by turning to a few particular cases referred to by Senator Hickenlooper.

In the case of Bill Waymack and Dr. Bacher, so far as the Commission is concerned, so far as the Commission itself is concerned, I think the best indication to Mr. Waymack is to put into the record at this point his letter of resignation to the President. I would not, and I am sure no one would care to have me, expand on the problems of strain involved in the kind of responsibility these five Commissioners bear, particularly in the formative organizational period of this undertaking, nor of the very great strain which trying to carry on an undertaking in secrecy in a country in which our habits are all against secrecy involves.

(The letter referred to is as follows:)

DECEMBER 15, 1948.

The President has sent the following letter to the Honorable W. W. Waymack, accepting his resignation as a member of the United States Atomic Energy Commission:

DECEMBER 13, 1948.

MY DEAR MR. WAYMACK: Because of the urgent considerations presented in your letter of November 9, I have no recourse but to accept at the close of business on Tuesday, December 21 next, your resignation as a member of the United States Atomic Energy Commission.

You have earned in the public service the rest which you hope to enjoy in the immediate future. I appreciate the patriotic impulse which caused you in compliance with my request to stay on for full 2 years of service with the Commission.

It is most encouraging that after this period of pioneering work in control of a new and incalculable force you are able to bear witness that key members, drawn from industry, government, and academic life, have responded to the unique challenge which the problem of this new force presented. Your own contributions to the Commission and to the national interest have been exceedingly valuable. It is a pleasure to assure you of my appreciation of work performed at such sacrifice.

I trust, after the period of rest which you so greatly need, you will find a new happiness and continued success in private pursuits.

Very sincerely yours,

HARRY S. TRUMAN.

Following is the text of Mr. Waymack's letter to the President:

November 9, 1948.

DEAR MR. PRESIDENT: This is my resignation as a member of the United States Atomic Energy Commission, effective at the earliest date you find to be feasible prior to Thanksgiving Day.

I have served full 2 years. On October 28, 1946, we five Commissioners first met in Washington, with you. On November 5, 1946, I personally took the oath of office. On November 13, 1946, the first official meeting of the Commission was held at Oak Ridge.

My reasons for asking relief now are altogether compelling. I intend first of all, and for the first time in years that seem countless, to try to get some rest. It happens to be needed, for reasons not unrelated to a succession of attempts at public service, including this one.

When I accepted appointment to the Commission originally, at several kinds of sacrifice, it was because I knew that some five men had to take on the job and duty of getting our national atomic energy development going on an entirely new basis—under law, with objectives much wider and of much longer term than the wartime mission, and with vigor. I did not contemplate, nor was I until last spring asked to contemplate, serving beyond the original term, which expired August 1.

On March 19 last you requested all the Commissioners to accept reappointment for the staggered terms then prescribed by the Atomic Energy Act. I expressed a strong wish to be relieved. This you overruled, on the ground, with which I had to agree entirely, that the Nation could not afford another sag in its atomic energy development, that to prevent this it was essential to maintain stability and continuity through a period admittedly critical, and that the best way of maintaining stability and continuity was to hold the Commission "team" together for an additional period.

For this reason of the Nation's vital interest, which our knowledge of conditions made resistless, the five of us did agree to accept the reappointments. And we shared the view that, as things then stood, the best course was to send the nominations to the Senate early, for action on confirmation.

Though the Congress, choosing a different course, amended the Atomic Energy Act by statute which extended the terms of all present Commissioners 2 years, the same consideration of the national need remained, and I felt bound by my promise.

At this March 19 conference with you, however, as you will recall, I asked that acceptance of reappointment for a specific term be not considered a moral commitment to serve out that specific term, regardless of all personal needs for relief, but that freedom to withdraw after the immediate critical period had passed was properly reserved.

The time now has come when I must withdraw.

I do not, of course, imply that the word "critical" is no longer applicable to our atomic energy problems. The very nature of those problems guarantees that it will be applicable for a long time. Nor are stability and continuity no longer essential. But these needs do not require absence of all change. Indeed, as to programs, the essence of the job is the learning of new things as rapidly as possible, with full awareness that new things learned may demand quick redirection of effort. I believe that the task of getting things started soundly and of getting a broad program "rolling" has been well accomplished. I believe it will not be hurtful, most likely will be beneficial, to make one change in Commission membership now.

I cannot omit a final comment.

Association with my fellow Commissioners and our General Manager—very able and self-sacrificing men from diverse walks—has been not only one of the pleasantest but also one of the richest experiences of my life.

Association in a common task with fine people of staff, of our contractors and of the National Military Establishment has been part of the reward also.

As to staff, the way key members, drawn from industry and government and academic life, have responded to the unique challenge of this operation, driving themselves without thought of exhaustion, is something that I have marveled at and been proud of, and that merits the country's appreciation.

And the continuous interest and understanding that have come from the President of the United States during two very difficult years have been of indispensable value.

These facts, above all others, have made tolerable a set of responsibilities that otherwise would hardly have been tolerable.

Respectfully yours,

W. W. WAYMACK.

Mr. LILIENTHAL. But I think this is exceedingly pertinent. Mr. Waymack felt the strain of this undertaking, as all the rest of us have, and his own letter expresses the need for his retirement better and more accurately than I can, but it does lead to the consideration of how one can hope to keep for very long periods in the Commissioners' posts and elsewhere individuals in mature years trying to begin a whole new technology under conditions that are really foreign to our ways and are foreign to the ways of administration, management, science, and industry.

Dr. Bacher's case illustrates a somewhat different point in the problems of continuity. Dr. Bacher's letter of resignation to the President was made public and is the best indication of his reasons, but he had spent 8 years in the service of his country away from his professional background, which is that of experimental physicist. He left Cornell, where he had tenure, to go to Los Alamos; he then had a short period between that time and the time of his invitation by the President to become a member of the first Atomic Energy Commission.

While his loss is greatly felt, the soundness of his reasons in returning, in his midforties, to his real interests, namely, his profession as physicist and the imposing post of chairman of the department of

mathematics, physics, and astronomy at Cal Tech, I think, take very little elucidation.

I hope that Dr. Bacher will be called here during the course of this hearing, partly because this would serve him right for having himself such a fine vacation now when some of the rest of us would like to have one, too, to give you in a sense, from the outside, the problems that a professional man has in taking up Government service and staying at it too long.

Dr. Fisk is another illustration that serves a useful purpose in illuminating the problems. Here is a young man in his early and middle thirties. He was a man of great talents as a physicist and a fellow with a lot of savvy and good sense and organizational ability, in my opinion. He served during the war; he then went to the Bell Laboratories, and then to Harvard University; he was then offered the post of assistant director of physical research at Bell Laboratories.

I am not acquainted with his salary, but you know this means that Dr. Fisk will, in the course of time, become one of the very principal officers of the Bell Laboratories. What is there in Government that could possibly be found that would persuade him for a very long time to continue in a post of Director of Research for the Atomic Energy Commission? I wish I knew the answer to this, because I think our country would have profited greatly if Dr. Fisk could have been persuaded to stay on.

We were advised once by Dr. Pitzer, his successor, a brilliant and outstanding young man in his field, that he would undertake that job only on a temporary basis.

All I am saying is that we must be prepared under whatever management, because of the nature of these men and their appropriate ambitions, that there will be lack of continuity. There is a good deal to be said for it in certain fields, because it brings in a fresh viewpoint, but these are human beings and personal problems are very real.

Jack Franklin is another illustration. Jack Franklin went to Oak Ridge from a very important post in industry, because here was a real challenge to a man of engineering and administrative experience, with the hope that he would have more and more time for the technical things that go on at Oak Ridge. His father was a professor of physics; he, himself, graduated in science; he went to Harvard School of Business Administration; he was interested in the technical side of industry.

The top position at Oak Ridge offered that opportunity, but what did he find? This is not by way of complaint, either, on my part or his, but these are realities, and anyone will find them for some time to come. He found, as he has himself estimated, about three-fourths of his time—a little higher than that—given over to the pressures and turmoil involved in the conduct of a company town. A company town, in my opinion, is a bad idea, though, it was inevitable at Oak Ridge.

He was naturally disappointed that more and more of his time could not be put into the technical side, and that he would not have to face constantly, week after week, such problems as rents and housing and the minutiae of the operation of the town.

But he found no alternative. He said to me—and I think this is the general comment of some importance in weighing the problems of the future of the recruitment of this undertaking—that he found it rather discouraging, compared with industry, that he spent at

least as much of his time explaining what he had done as in trying to get new things done.

Those of us who have been in the Government service quite a long time regard this as an essential part of the price one pays for Government administration; this undertaking is owned by everybody. Nevertheless, this will be a problem from here on out if the Government seeks to develop a new industry in this field.

Men in industry, especially technical men, find it very discouraging to be spending so much time in explaining what they have done as distinguished from planning things for the future and doing actual administration.

The point of taking this time is that we are talking now about a problem that will beset us from here on out in this enterprise. It is not peculiar to these four men. The problem of compensation has been talked about so much that I will not venture to expand on it.

Everyone is aware of those difficulties. Our first experience was one that was somewhat difficult to bear in terms of the recruitment and maintenance of continuity of top personnel. The McMahon Act, after long hearings, recognized this very problem we are talking about today. It also recognized that in Government one cannot pay salaries comparable to those of industry but that something between those two should be possible where managerial and special technical problems were faced, and, therefore, the statute itself, the basic law, provided that the Commission might, where necessary for the conduct of the enterprise, exceed the Classification Act.

The first appropriation measure—and I am not in any sense complaining of this because it is in the tradition—in a sense revoked that authorization, that flexibility, by an appropriation restriction which limited that flexibility to technical and scientific personnel—I believe that is the language. We discussed this matter with the joint committee and indicated that the real problem is not so much in the salaries of technical and scientific people as it is with the management people; that problems of management are the paramount ones, and unless we have skilled and experienced managers, the scientists and technical people will have great difficulty making headway.

We were not able to get anything done about that, but I simply call it to your attention, and in any discussion of lack of continuity, I am sure these factors will be borne in mind and, I hope, will be included in your report.

The CHAIRMAN. Perhaps we can have an analysis of these breakdown sheets.

Senator HICKENLOOPER. Mr. Chairman, you have been very courteous, and I want to suggest one thing in connection with the continuity of management.

The two men who were brought in from industry, Mr. Franklin and Mr. Shugg, and paid the \$18,000-a-year salaries as an inducement are now no longer managers of the institutions to which they were essential. The manager of the other institution, Captain Tyler, who is retired from the Navy, is still with the institution, but he is not an \$18,000-a-year man, and he did not come from industry. He is paid a lesser salary, but he is the only one of the three who is still in these vital institutions. I think the record might show that.

The CHAIRMAN. I am trying to work out the order of questioning here. Obviously, we must have an order.

I have no further questions at this time. Senator Vandenberg?

Senator VANDENBERG. No questions.

The CHAIRMAN. Senator Connally?

Senator CONNALLY. No questions.

The CHAIRMAN. Mr. Durham?

Mr. DURHAM. No questions at this time.

The CHAIRMAN. Mr. Cole?

Mr. COLE. Yes, Mr. Chairman, I have two or three questions.

Mr. Lilienthal, who besides Mr. Waymack and Dr. Bacher, members of the Commission, had your approval before they were appointed?

Mr. LILIENTHAL. I was appointed after the other two members were appointed, Mr. Pike and Mr. Strauss.

Mr. COLE. Did you recommend or approve the appointment of the two recent Commissioners?

Mr. LILIENTHAL. I was consulted for a list of names, and the entire Commission was asked to submit a list of names, and we did.

Mr. COLE. And both the individuals had your approval?

Mr. LILIENTHAL. No; I did not know Mr. Dean. I have since come to know him. He is a very able, sagacious man. I did not know him prior to his appointment, so I could hardly have had a basis for judgment of that character.

In the case of Dr. Smyth, the Commissioners relied heavily upon the recommendation of Dr. Bacher, and I assume that the President took his recommendations into account.

You speak of approval, Mr. Cole. You realize that it is not exactly the process, because it is the President who does the appointing.

Mr. COLE. I realize that; yes. On those occasions when it was necessary for the Commission to reach a formal decision, were your own personal views ever in the minority?

Mr. LILIENTHAL. No; there have only been—I say this with some satisfaction: There have been in excess of 500 formal actions by the Commission in this period; there have been five instances in which there was disagreement. In each case, it was a 4 to 1 disagreement. These are the full facts about disagreements.

Mr. COLE. Was that one always the same individual?

Mr. LILIENTHAL. Yes, it was.

Mr. COLE. The Commission initially was appointed in August of 1946, approximately?

Mr. LILIENTHAL. October, I believe, sir.

Mr. COLE. Took over from the Manhattan District in January of 1947?

Mr. LILIENTHAL. That is right.

Mr. COLE. And the first security officer was appointed in August of 1947, Director of Security?

Mr. LILIENTHAL. First permanent officer; that is correct.

Mr. COLE. Is it not correct that not until January of this year were the duties and responsibilities and authority of the Director of Security ever promulgated by the Commission?

Mr. LILIENTHAL. I believe that is not correct, Mr. Cole.

Mr. COLE. Do you know when? Can you correct the date?

Mr. LILIENTHAL. I can get for the record or I can read now the series of authorizations, regulations, bulletins, and so on, on this subject.

Mr. COLE. Is it not correct that those instances to which you refer were piecemeal, bit-by-bit decisions with respect to security and not an over-all declaration of the responsibilities and the authority of the Director?

Mr. LILIENTHAL. Well, each one of them was a unit in itself.

Mr. COLE. Dealt with a particular phase of security?

Mr. LILIENTHAL. No; I think not. The delegations were spelled out, they were modified, the procedure has been under change, and I believe improvement, and I assume at the appropriate time a full statement of that will be made.

But if what you have in mind is that it was not a full statement as far as one could then see it of the responsibilities of the Director of Security and Intelligence at the outset of Admiral Gingrich's service, I believe that is not correct.

Mr. COLE. The reason I asked the question was the committee was advised by Admiral Gingrich that it was in January of this year that the first over-all delineation of the authority and responsibility of the Director of Security was made by the Commission. I just wanted to verify the correctness of that statement.

Mr. LILIENTHAL. I believe Admiral Gingrich, if that was his statement, is incorrect in this. In January of this year under this reorganization there was a new statement of the responsibilities, and so on, of the Director of Security, replacing an earlier one.

The earlier one was less complete, no doubt, than the present one, but I think—the record, of course, will support that, I am sure.

Mr. COLE. You will provide that for the record?

Mr. LILIENTHAL. Yes; I assume at some time there will be a rather comprehensive statement of the full security picture and we will then be happy to have a chance to do that.

Mr. COLE. I have only one other question.

Mr. Lilienthal, in response to one of the questions of Senator Hickenlooper, you expressed the opinion of the Commission that the Director of Security should have a free hand in the selection of his personnel.

Is that true with respect to the authority of the Director of Security to select personnel outside of Washington? That is, the security people in the field?

Mr. LILIENTHAL. Well, I state it as a general proposition that one gets a man and puts him in a responsible position, you should, as far as possible, see that he names the men who are around him and as a general proposition I should think that is true. I am sure there are cases where it is not true.

Mr. COLE. It was not true with respect to the Director of Security, was it?

Mr. LILIENTHAL. I am not aware that his recommendations were not given very great weight. One could not say that he should have no limitation on his judgment. The Commission itself would not act in these matters, but speaking about a general organization principle, I would assume that his recommendations would have a good deal of weight.

Mr. COLE. Did the Director of Security have any authority beyond that of making recommendations with respect to the selection or the transfer or the duties or the responsibilities or the authority of the security people out in the field?

Mr. LILIENTHAL. I would have to consult with records before I am able to answer that.

Mr. COLE. That is all.

The CHAIRMAN. Senator Millikin?

Senator MILLIKIN. No questions.

The CHAIRMAN. Mr. Holifield?

Mr. HOLIFIELD. Yes, Mr. Chairman.

Mr. Lilienthal, the management of the atomic energy projects is a matter of majority decisions by the Atomic Energy Commission members, is it not?

Mr. LILIENTHAL. Yes; that is correct.

Mr. HOLIFIELD. On the setting up of projects or the adoption of administrative policy it is a matter of discussion by your five-man Commission, and a determination by a majority vote thereof?

Mr. LILIENTHAL. Yes; and may I expand on that just a moment, because I think there is some misapprehension.

The statute does not declare the Chairman of the Commission the chief administrative officer in addition to the ordinary duties of presiding at meetings and signing documents and speaking for the Commission when to have five men speak would not work, he is not given special statutory authorization, nor has the President under his general powers given the Chairman special authorization.

The Commission, furthermore, at the very first meeting, or certainly at an early meeting, determined, upon my recommendation but with the concurrence of all the members, that the administrative responsibilities should not be divided up among the five Commissioners, that we should act as a unit, and as a unit we have acted.

Mr. HOLIFIELD. In other words, you did not divide the work of the Atomic Energy Commission into compartments, but each one of the five accepted the full responsibility for the total program?

Mr. LILIENTHAL. That is correct. That is the pattern of organization of the Commission.

Mr. HOLIFIELD. Now, if your administration of this atomic energy project is deemed to be incredible mismanagement, that burden of inefficiency or incompetency would have to be borne by the complete five members of the Commission because of the facts that you have stated?

Mr. LILIENTHAL. Yes.

Mr. HOLIFIELD. In order to clarify that point, have you ever on any occasion overridden the majority decisions of your Commission? As an individual have you overridden a majority decision?

Mr. LILIENTHAL. Never to my knowledge.

Mr. HOLIFIELD. I would like to pass from that to a comparison of the operations of Oak Ridge, Hanford, and Los Alamos from the standpoint of the magnitude of their operation. That would include, certainly, the number of personnel.

I would like to have a comparison of the number of personnel employed at Oak Ridge, contractor and AEC, in round numbers.

Mr. LILIENTHAL. To be supplied?

Mr. WILSON. Contractor and AEC personnel at Oak Ridge, I believe about 12,000 probably.

Mr. HOLIFIELD. About 12,000, and that number will be corrected for the record later, please.

(The following was later submitted for the record:)

The total contractor and Atomic Energy Commission personnel at Oak Ridge numbered 19,573 as of April 1, 1949.

Mr. WILSON. At Hanford, contractor and AEC together at the present time about 18,000. These will be corrected.

Mr. HOLIFIELD. 18,000 at Hanford.

(The following was later submitted for the record:)

The total contractor and Atomic Energy Commission personnel at Hanford numbered 16,706 as of April 1, 1949.

Mr. WILSON. At Los Alamos about 8,000.

Mr. HOLIFIELD. About what?

Mr. WILSON. About 8,000.

(The following was later submitted for the record:)

The total contractor and Atomic Energy Commission personnel at Los Alamos numbered 10,582 as of April 1, 1949.

Mr. HOLIFIELD. About 8,000. Now, the comparison was made between the salaries paid at Oak Ridge, Hanford, and Los Alamos. Captain Tyler at Los Alamos is receiving what compensation?

Mr. WILSON. \$14,000.

Mr. HOLIFIELD. \$14,000. The other two Directors received \$18,000, I believe you stated.

Mr. WILSON. That is right.

Mr. HOLIFIELD. Is it not true that Captain Tyler at Los Alamos is a retired Navy officer drawing a retired Navy officer's pay in addition to that?

Mr. WILSON. Not during his period of service with the Commission.

Mr. HOLIFIELD. He had to forego that in order to obtain his directorship of the Los Alamos project?

Mr. WILSON. He had to forego it during his tenure of service with the Commission.

Mr. HOLIFIELD. However, his operation there of approximately 8,000 personnel is less than half of Hanford and only two-thirds of Oak Ridge, is it not?

Mr. WILSON. Approximately, in terms of personnel involved.

Mr. HOLIFIELD. Now, in your presentation to this committee of the analysis of the personnel turn-over, will you please give us, in addition to the figures supplied in the chart, the number of people who have been separated for all reasons from regular positions, and the number of people who have been included in that list as temporary employees, and the number of people that have been placed in the list as consultants or technical experts? Will you supply that information?

(See exhibit 1 in the appendix to follow [the last part of these hearings.]

Mr. WILSON. Yes, sir.

Mr. HOLIFIELD. That is all, Mr. Chairman.

The CHAIRMAN. Senator Knowland?

Senator KNOWLAND. Mr. Lilienthal, could you supply for the record—I assume you do not have it here now—the security regulations that were in effect at Argonne National Laboratory in November of 1948 when the shipment of uranium was made between your locations and just what was required to be done in the way of inventory, what was required to be done in the way of the recipient signing

the receipt therefor, and such other security regulations as were in effect during the period of time from November 1948 up to the present time?

Mr. LILIENTHAL. Yes, Senator; and may I say that I am assuming, and, I hope, correctly, that the whole picture of the general over-all regulations as to accountability will be gone into at some juncture.

The CHAIRMAN. You need have no doubt of it.

Senator KNOWLAND. Also will you have available for examination by the committee the documents that went along with the shipment at the time the shipment was made in November 1948?

Mr. LILIENTHAL. Yes; we will do that.

(The documents referred to are classified. They are on file in the office of the Joint Committee on Atomic Energy.)

Senator KNOWLAND. Would you tell the committee now or could you supply for us the information as to whether or not recently at the Argonne National Laboratory green stickers have been issued to a number of employees at Argonne which permit them to pass in and out of the various establishments and prohibit the guards from making any inspection of the automobiles? Are you familiar with that regulation?

Mr. LILIENTHAL. No; I am not familiar with that regulation.

Senator KNOWLAND. Will you supply the committee with the information as to the date when that new regulation went into effect and a copy of the regulation that was issued, which I believe was subsequent to the disappearance of this quantity of uranium.

Mr. LILIENTHAL. I will ask for a report on this situation you have described.

Senator KNOWLAND. Will you also supply to the committee such information as may be available as to either written or verbal instructions which have been given to the guards at the Argonne National Laboratory relative to the fact that they should not write up any security infractions by officials at the Argonne National Laboratory, if that is in fact true?

Mr. LILIENTHAL. If that is in fact true, I will ask the Argonne Laboratory to supply that.

Senator KNOWLAND. Will you make inquiries as to whether or not there have ever been instances in which the master-key file was left open by officials at the laboratory and the guards were instructed not to write up a security violation regarding the same?

Mr. LILIENTHAL. If those are the facts, I will ask the laboratory to give us a record.

(See exhibit 2 in the appendix to follow the last part of these hearings.)

Senator KNOWLAND. That is all at the present.

The CHAIRMAN. I have just one question, Mr. Lilienthal, before I turn you over to Mr. Price. How many installations have you now?

Mr. LILIENTHAL. In the last report to Congress we stated that there were—and this is a fact—in excess of 1,200 installations of various kinds as far as security problems are involved, 1,200 or slightly in excess of that.

The CHAIRMAN. Of course, some of those are your great installations such as Oak Ridge and Hanford.

Mr. LILIENTHAL. Yes.

The CHAIRMAN. And others might be where one particular scientist was on a work problem and he has some secret documents. That

would be considered a secret installation, too, as I understand it. Let's take Dr. Oppenheimer, for instance. He works on secret matters up at Princeton, N. J. He has access to restricted data; he has access to secret documents. Do you find it necessary to guard him as an installation?

Mr. LILIENTHAL. Yes; we certainly do, and Dr. Oppenheimer himself is a piece of classified information.

Senator, to make the answer a little more accurate, on page 123 there appears the following sentence, which was carefully considered:

At the close of 1948 there are 1,270 separate plants, laboratories, offices, storage facilities, test areas, and other installations where the Commission must protect restricted information and strategically important facilities and materials.

The CHAIRMAN. There are about 64,000 people working on the project, which includes the contractors' employees?

Mr. LILIENTHAL. The total personnel is in excess of 60,000.

The CHAIRMAN. About 64, I think.

All right, Mr. Price.

Mr. PRICE. Mr. Lilienthal, do the figures which have been read into the record on the percentage of personnel turn-over include the number of people who have left AEC to take work with contractors doing work for the AEC?

Mr. LILIENTHAL. Since I did not see the figures before this meeting, and only heard the summary of them, I would not be able to answer that. I will be prepared with an analysis, Mr. Price, rather promptly.

Mr. PRICE. And also the number of employees in the central office here in Washington who may have gone into the field that might possibly be included in those figures.

Mr. LILIENTHAL. A very considerable number of transfers of that kind; yes, sir.

Mr. PRICE. Army and military officers who may have been in some way connected with the AEC who have resigned or have gone back into their actual duty in the military.

Mr. LILIENTHAL. I am confident that what you have stated is true, but we will present it in detail when we get the analysis.

Mr. PRICE. Mr. Chairman, while we are talking on the question of continuity, I would like to point out that 15 percent of the Navy officers who have been integrated into the service since 1946 have already resigned. Since Marshall we have had two Chiefs of Staff of the Army; since Arnold, we have had two commanding generals of the Air Force.

That is all I have right now, Mr. Chairman.

The CHAIRMAN. Mr. Elston?

Mr. ELSTON. Mr. Lilienthal, I was interested in your statement that your security officer was given a free hand in the selection of personnel who worked with him. Is that correct?

Mr. LILIENTHAL. What I intended to say, Mr. Elston, was that the Director of Security, as to his Washington staff, the men who worked immediately around him, the general policy was to give him great latitude. I probably did use the term "free hand." I meant great latitude, almost unlimited discretion in staffing his immediate Washington office, and I believe that is true.

Mr. ELSTON. Does he have anything to do with the personnel in the offices in the field, the security personnel?

Mr. LILIENTHAL. Yes; I believe he has.

Mr. WILSON. Yes; he has very direct relationships with them. They actually serve on the staffs of Managers of Operations, but those Managers in their instructions are asked to consult and advise with the Director of Security in the appointment, dismissal, promotion, et cetera, of their security officers, and this has been done.

Mr. ELSTON. Is it not a fact that the Manager in the field has the authority to hire and fire security personnel?

Mr. WILSON. He has the authority, subject to the consultation with the Director of Security, which in fact—

Mr. ELSTON. Only consultation?

Mr. WILSON. That is right.

Mr. ELSTON. The security officer himself has no right to go into a field installation such as the Argonne Laboratory in Chicago and fire any security employee, has he?

Mr. WILSON. The Argonne National Laboratory is a contractors' organization where we would not directly fire people anyway. We would take it up with the Director of the Laboratory and the Laboratory management.

Mr. ELSTON. You have personnel of your own?

Mr. WILSON. In Chicago, yes.

Mr. ELSTON. Does the security officer have the right now to hire or fire any of that security personnel that is under the Commission in any of the field offices, Chicago or anywhere else?

Mr. WILSON. Security officers at those installations report to and are appointed by and fired by the Manager of Operations, but any security officer in the field who is unsatisfactory to the Director of Security in Washington, any such instance would certainly be brought to my attention by the Director of Security and a satisfactory solution found. I know of no such instance.

Mr. ELSTON. How would he know they were not performing their duties properly if they do not report directly to him?

Mr. WILSON. He has an inspection group. He visits many of the installations, he has a group of inspectors on physical security and other aspects of security, which visits these offices, examines, and reports back the conditions there.

Mr. ELSTON. As to those persons who have charge of vital materials such as uranium, who hires and fires those persons?

Mr. WILSON. The Manager of Operations is responsible for them. Actually, as far as people handling these vital materials, I am sure, as you recognize, Mr. Elston, there are thousands of people throughout these plants, throughout these laboratories who handle these materials in working with them.

As far as the accountability officer for the material, he is appointed by the Manager of Operations and the staff responsibility in terms of the accountability for materials is handled by the Director of Production in Washington.

Mr. ELSTON. A few days ago Mr. Lilienthal said that the Commission had overruled the security officer on a couple of occasions. I will ask you whether or not the Commission ever delegated to anyone else the power and the authority to overrule your security officer.

Mr. LILIENTHAL. I assume, since the Director of Security was responsible to the General Manager, that inspection of the organization charter will show that the Director of Security as a subordinate officer

would be subject to the review of his superior officer, the General Manager.

Mr. ELSTON. So that the General Manager had the authority, then, to overrule the security officer on any matter pertaining to security?

Mr. LILIENTHAL. Yes; but the Director of Security had immediate access to the Commission in Commission meetings, and his views, where they differed with the General Manager's views, could be and have been brought to the Commission's attention.

Mr. ELSTON. Now, have there been any occasions when the General Manager overruled the decision of the security officer?

Mr. LILIENTHAL. I am not aware of any, although there may be. Some of these questions are purely hypothetical because, to my knowledge, there has never been a case, and I believe there has not been an instance in which the Director of Security, being dissatisfied with a security officer in the field, responsible to the Manager of Operations as an organizational matter, having brought that matter to the General Manager's attention, that such person was not dismissed. I do not believe any such case ever occurred.

Mr. ELSTON. Your General Manager is seated there beside you. Let's get his answer. I notice he indicated by nodding his head that there had been cases when he had overruled the security officer on matters of security.

Is that correct?

Mr. WILSON. I know of two instances where the matter came to the General Manager with the views of the director of a program division involved and the views of the Director of Security, and in the balance in two cases an action was taken to uphold the director of the program division, and in that case overrule the Director of Security.

In neither case did the Director of Security have serious misgivings about this, in neither case did he bring it to the Commission, and the door was always open to him. The Director of Security was invited to practically all the Commission meetings, as are the other members of the staff.

Mr. ELSTON. Have there been cases in which the Commission has retained in its employ persons who have been referred to by the security officer as poor security risks?

Mr. WILSON. The two cases I speak of are cases where the Director of Security believed that there was a security risk involved in retaining an individual, and it was on that question that there was a difference of judgment.

Mr. ELSTON. What two cases are you referring to?

Mr. WILSON. The two cases I am referring to, I would rather not mention here by name. I would be glad to furnish names and backgrounds of the cases to the joint committee.

There were two cases in which the Commission itself undertook, as the ultimate body responsible for judgment and decision, the study and decision on two personnel security cases which were mentioned at the hearing last week, Dr. Condon and Dr. Graham.

Mr. ELSTON. Are you referring to two cases other than the two cases referred to by Mr. Lilienthal last week?

Mr. WILSON. I am.

The CHAIRMAN. Same cases or different ones?

Mr. WILSON. The two names, which I would not prefer to state here as names; the full record we will be glad to give to the committee;

they are not the two cases which were mentioned last week. That is out of a total of over 100,000 cases.

Mr. ELSTON. I will not ask you to give the names until we have an opportunity to review the record, but I will ask you to produce the record. Will you do that?

Mr. LILIENTHAL. The committee has had these records all along.

Mr. ELSTON. All right.

The CHAIRMAN. Mr. Wilson, will you look upon the list that Senator Hickenlooper gave you and check whether or not the two that you have in mind are listed by him on the list; and, if not, I take it, Senator, that you would like those two names added to the list.

Is that it?

Senator HICKENLOOPER. They may be on there.

Mr. WILSON. They are on there.

Mr. ELSTON. May I ask you this much, Mr. Wilson: Had the security officer recommended against those persons because they were considered subversive?

Mr. WILSON. The details of the folders I would have to refresh my mind about, but he did say he believed there was a security risk here involved and did not recommend clearance.

Mr. ELSTON. And were they given clearance?

Mr. WILSON. They were.

Mr. ELSTON. And what types of positions did they hold?

Mr. WILSON. I think they were both in laboratories of our contractors. I would have to refresh my memory as to the details.

Mr. ELSTON. Where they had access to top secrets?

Mr. WILSON. They had access to secret information.

Mr. ELSTON. Did they have access to material such as uranium?

Mr. WILSON. In one case, yes. A great many of the people working in laboratories naturally do have access to the working substance of the laboratory, which is uranium and its various compounds.

Mr. ELSTON. As I take it now, you overruled your security officers' recommendations in those two cases?

Mr. WILSON. I did not consider there was a security risk involved.

Mr. ELSTON. Did you consider that you were better able to judge matters of security than the security officer?

Mr. WILSON. I had the ultimate responsibility for decisions in these cases before taking them to the Commission. In neither of these cases did I believe that the issues were such that I should take them to the Commission. That was a matter of my own judgment.

Mr. ELSTON. In other words, you did not even take them to the Commission?

Mr. WILSON. No, I did not.

Mr. ELSTON. Did you ever have any experience as a security officer?

Mr. WILSON. No.

Mr. ELSTON. And may I ask who the security officer was who recommended against these two persons?

Mr. WILSON. Admiral Gingrich.

Mr. ELSTON. May I ask how long ago it was?

Mr. WILSON. This spring, sometime.

Mr. ELSTON. Are those two persons still employed?

Mr. WILSON. I believe only one of them is.

Mr. ELSTON. Let me ask you whether or not at any time you overruled other recommendations of your security officer not with respect to personnel but with respect to security measures.

Mr. WILSON. I have no recollection of any other cases.

Mr. ELSTON. Just one other question. Let me ask you now to be a little more specific.

What control did the executive officer himself have over personnel in the Argonne Laboratory who had access to the material that was allegedly lost, strayed, or stolen?

Mr. WILSON. Control comes up in several ways. First of all, the Director of Security was responsible for the investigation and review of records and clearance of the people involved and employed in the Laboratory; secondly, the physical security measures employed in the Laboratory were carried out according to the regulations and instructions developed and promulgated by the Director of Security. He was not responsible directly for the accountability for material, which is a highly technical accounting and analytical function.

Mr. ELSTON. Did he have any control over the persons who had the combination to the safe in which this material was kept?

Mr. WILSON. If, on the basis of the records which were fully available to him, he felt that the persons there were unreliable as people to have access to these combinations, it was up to him to take the initiative to indicate that to the contractor, the Argonne National Laboratory.

Mr. ELSTON. Those persons were directly responsible to him?

Mr. WILSON. The people employed by the Laboratory were directly responsible to Dr. Walter Zinn, the Director. They are employees of the University of Chicago.

Mr. ELSTON. And not to the security officer?

Mr. WILSON. That is right.

Mr. ELSTON. That is all.

The CHAIRMAN. Next would seem to be Mr. Kilday.

Mr. KILDAY. No questions, Mr. Chairman.

The CHAIRMAN. Mr. Jackson?

Mr. JACKSON. Mr. Lilienthal, when did you submit the information regarding turn-over in personnel to the joint committee? When did you start submitting it to the committee?

Mr. LILIENTHAL. From the very beginning, Representative Jackson.

Mr. JACKSON. And you submitted monthly reports to the Committee on Atomic Energy?

Mr. LILIENTHAL. Quarterly reports have been submitted, almost from the outset.

Mr. JACKSON. As I understand, starting January 1, 1947.

Mr. LILIENTHAL. I am not entirely sure about the date, but it is in that general area.

(The following was later submitted for the record:)

The first personnel report, covering the months January through September 1947, was submitted November 1947.

Mr. JACKSON. I take it one of the bits of evidence that is being offered here as to incredible mismanagement is the turn-over in personnel, and what I would like to make clear for the record is as to how long this information has been available to the joint committee.

Mr. LILIENTHAL. I think the extent to which the joint committee has been kept informed should be gone into quite extensively. For example, there have been 562 letters on various subjects submitted to the joint committee since the beginning. There have been this series of quarterly reports, reports each 3 months. There has been a

great lot of reporting, both as to administration, management, and top secret and secret information of various kinds.

I think also, to turn a moment to the subject of Mr. Elston's inquiries, by a special arrangement with the Attorney General, the confidential files of the FBI in the order of hundreds and hundreds and hundreds have been available to the committee and have been used by the committee, and in some instances have been retained for quite a period of time under this arrangement.

Senator HICKENLOOPER. Mr. Chairman, may I give what I believe to be a correction of that statement?

The CHAIRMAN. Yes.

Senator HICKENLOOPER. The files of the FBI have never been opened to the joint committee. The investigatory files that have been opened to the joint committee have been the files of the Commission and not of the FBI. I believe the FBI will verify that.

Mr. LILIENTHAL. Senator Hickenlooper, let's see if we cannot clarify that. The only reports we receive from the FBI are the reports which this joint committee has had from the outset. Whether you call these FBI reports or investigative reports, they are the only reports from the FBI that we had.

The CHAIRMAN. They are reports made by the Federal Bureau of Investigation to the Commission on investigations that they have made of the personnel as recommended and, in fact, required under this act.

Mr. LILIENTHAL. That is correct.

The CHAIRMAN. And those are the files which this joint committee has had the privilege of examining under the seal of confidence and under the agreement that the contents thereof would not be divulged; is that right?

Mr. LILIENTHAL. Yes, that is correct, Senator; and, of course, the importance of what you said is underlined by the fact that there is an Executive order which is binding upon all the agencies of the Government with respect to confidential Executive files of this character, and an arrangement was worked out that, provided the files were dealt with in a confidential way, the joint committee would have, and it has, full access to these reports.

Senator HICKENLOOPER. I would like to clear this right now, because I do not want any thought that the joint committee has ever had access to FBI files, the Federal Bureau of Investigation; nor—I want to say for the record—did I ever engage in any arrangements whereby files could be accessible. I stood entirely upon the provisions of the Atomic Energy Act that the joint committee was absolutely entitled to utilize the information, facilities, personnel of the departments and agencies of Government, and I did deal and the committee dealt with the files which were the property of the Commission.

Now, where the Commission got those would be more or less beside the point, but they were the property of the Commission at the time we got them.

The CHAIRMAN. I think that is understood.

Senator HICKENLOOPER. I do not want the understanding to be that we were permitted to go in FBI files, because I do not know of anybody who has.

The CHAIRMAN. I think that is entirely clear as to just what the situation was.

Very well. Mr. Jackson?

Mr. JACKSON. Mr. Lilienthal, did you have any correspondence from the committee in 1947 or 1948 regarding the turn-over in personnel, do you recall?

Mr. LILIENTHAL. I do not recall any on that subject.

Mr. JACKSON. Was any hearing called to discuss what is now purported to be incredible mismanagement in 1947 or 1948 on the turn-over?

Mr. LILIENTHAL. I believe not, Mr. Representative.

Mr. JACKSON. You do not recall any correspondence or information requested during that time?

Mr. LILIENTHAL. No, and I have reviewed the correspondence recently, and I believe if there had been, I would have it in mind.

Mr. JACKSON. Now, I take it that, according to the figures that were submitted here, there was a turn-over of 54 percent in 1947 and 1948, a decline to 34 percent; I believe those are the figures that were submitted for the record.

I take it, then, Mr. Lilienthal, that there has been a decline in the rate of turn-over since 1947.

Mr. LILIENTHAL. I would not want to say, Mr. Jackson, because I think an analysis of these figures is badly needed, and I would not want to predicate any answer on the soundness without an analysis of these percentages.

Mr. JACKSON. Do you know how your turn-over compares with other agencies of the Government?

Mr. LILIENTHAL. I do not have that in mind. My impression is that it runs about at the average for the Government as a whole.

Mr. JACKSON. Do you know how many assistant secretaryships of State resulted in turn-overs in the last 3 years?

Mr. LILIENTHAL. Yes; I know by common observation that the turn-over of personnel in the upper ranks of Government service has been numerous and well scattered all through the Government. It is a common occurrence, far too common, but a familiar phenomenon.

Mr. JACKSON. It would occur to me, Mr. Chairman, if this is the evidence of incredible mismanagement, there must be an awful lot of incredible mismanagement in the Government.

Mr. LILIENTHAL. Mr. Jackson, I failed to mention among the reports the monthly reports of violations, which has been a routine report to the joint committee—violations or potential violations.

Mr. JACKSON. One last question, Mr. Chairman.

I wonder, Mr. Lilienthal, if you could give at this time any information as to the separation and turn-over of employees under the Manhattan project?

Mr. LILIENTHAL. Well, during the war a good many of the individuals in the Manhattan District did not have much alternative about turn-over, and if they did start to turn over and they were civilians, they were often put into uniform.

The exodus from the undertaking after August 1945 was general and, in some respects, complete, so that the turn-over there was very high indeed.

I think we can get for you and would like to bring to the committee some analysis in that respect. Perhaps Mr. Wilson may have something on the top of his mind that he can use as illustration now.

Mr. WILSON. I believe that in the construction of K-25—this, of course, embraces all employees and includes construction and contractors—the highest employment at any given time was 25,000, but actually 125,000 people were employed from the beginning to the end in order to maintain a constant supply of 25,000 people.

Mr. JACKSON. A turn-over of five times?

Mr. LILIENTHAL. That was in the construction project.

Senator HICKENLOOPER. I have not gone into the turn-over in present construction employees who were temporary. I think that would run into the thousands and thousands. I do not raise any question about temporary employees.

Mr. JACKSON. Senator, that is probably right. In order to keep the issues relevant, I suggest we have supplied for the record the turn-over of Manhattan employees during the period of its operation until the taking over of the Manhattan project by the Atomic Energy Commission. That is all I have.

(See exhibit 3 in the appendix to follow the last part of these hearings.)

The CHAIRMAN. We have gone down the list of the members. I take it, Senator Hickenlooper, we have concluded chapter 1:

Senator HICKENLOOPER. At least for this morning.

The CHAIRMAN. I meant to get this defined. We have talked about the handling of personnel, which certainly is a pertinent and relevant test of the efficiency of management and one that certainly is correctly, as I see it, brought up in any charge of mismanagement.

There has been information asked for, and the Commission will be given an opportunity to put that information in the record.

Now, what I am trying to get straight is: Is this the close of this chapter?

Senator HICKENLOOPER. Well, this is chapter 1. It may be a rather lengthy book, but I wanted to merely lay this phase this morning and give time for other members to question. Undoubtedly there will be discussion from time to time about this personnel matter and personnel turn-over, but I do not intend at this point to pursue specifically this particular phase of it.

I do this by way of what I believe to be substantial illustration, and I assure you that if I wanted to bring out many more individual cases in secondary positions of importance, it could be done, but I do not believe I want to burden the committee on that point. I believe the point has been developed, as far as that is concerned, and I will move on to some other matters.

The CHAIRMAN. Thank you, Senator.

Senator KNOWLAND. Mr. Chairman, I would like to clear up one point.

The CHAIRMAN. Proceed.

Senator KNOWLAND. Did I understand in answer to one of the questions that following the closing out of the Manhattan District, there had been a general exodus of employees who had formerly been employed by the Manhattan District?

Mr. LILIENTHAL. What I said, Senator, was that following the close of the war that was true.

Senator KNOWLAND. Does that include the scientists? Would you say there had been a general exodus of scientists from the project subsequent to the war?

Mr. LILIENTHAL. Oh, yes; the indications are clear that following, say, August or the autumn of 1945, the close of the war, there was a very great change in personnel, an exodus of scientists, technical people, management people, industrial people, and so on.

Senator KNOWLAND. So that I would gather from that that as a result, when the Commission came in, it became necessary to more or less set up an entirely new set of key personnel in the project; is that correct?

Mr. LILIENTHAL. It certainly became necessary to do a great deal of shoring up and reorganizing because the objectives set out in this act were, of course, different and broader than those set out in the Manhattan project.

Mr. COLE. Mr. Chairman, may I ask a brief question?

The CHAIRMAN. Yes.

Mr. COLE. With reference to the personnel reports that have been made available to the committee and which the Commission has received from the FBI, have there been any instances when that report has been altered or modified in any respect by the Commission?

Mr. LILIENTHAL. You mean forgery, that sort of thing?

Mr. COLE. Call it whatever you will. I would not call it forgery, but I am asking if the reports which the Commission has received from the FBI as to individuals involved have been modified or altered in any respect by the Commission before or at any time during the scrutiny of the staff members of this committee.

Mr. LILIENTHAL. Oh, no. The integrity of the reports is what you are referring to?

Mr. COLE. Yes.

Mr. LILIENTHAL. These, I am confident—there were, of course, a great many of them, but I am confident no one has ever—

Mr. COLE. Have there been any instances where that report has been sent back to the FBI for revision in any respect?

Mr. LILIENTHAL. It is common practice to send it back for further investigation.

Mr. COLE. Have any of them ever been sent back for the deletion of information that may have been originally contained?

Mr. LILIENTHAL. I am sure that has not been true. There have been many instances, of course, where questions have been raised in the investigation which leave many unresolved questions, and the record may be sent back several times for further inquiry.

Mr. COLE. That would be only because of the incompleteness of the report?

Mr. LILIENTHAL. In the opinion of the one who was working on the report.

May I comment on the state of the record so far as this phase of management is concerned?

The CHAIRMAN. Yes.

Mr. LILIENTHAL. I am hoping that it will be true that, as I indicated some days ago, when the committee has heard from the Commission on the question of management as a whole, including the question of turn-over and the problems ancillary to it, that not only will there be testimony from the Commission and its staff, but, if agreeable to the committee, from outside experts on this subject.

The CHAIRMAN. There will be members of the committee who will be interested in calling witnesses other than members of the Com-

mission, Mr. Lilienthal, in order to get further light on the subject. I think you need not fear, as far as I can speak, as the chairman of the committee, that you are not going to get a fair chance to present the situation as it exists as a whole.

Mr. LILIENTHAL. Mr. Chairman, I am sure that is true. My only question related to the use of the term "closing of the chapter," and I assume that meant only——

The CHAIRMAN. I overlooked the significance of that. What I meant was there was to be no further presentation of evidence. I understand, too, that it is impossible in an investigation of this kind for Senator Hickenlooper to put in in watertight compartments his material, and I was not indicating that I expected him to do so, but rather that this was a broad subject on which we had had his presentation.

Mr. LILIENTHAL. I understand.

Mr. HOLIFIELD. I have one question. As I understand it, any of the testimony that is taken at any meeting can be referred to and new questions on that particular subject advanced at any of our subsequent meetings.

The CHAIRMAN. I see no way in which that could be avoided even if it were desirable, and I do not regard it as being desirable.

If there are no further questions by members of the committee, we will recess until 10 a. m. tomorrow morning in this room.

(Whereupon, at 12:55 p. m., the joint committee adjourned to reconvene at 10 a. m., Thursday, June 2, 1949.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

THURSDAY, JUNE 2, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment, at 10:05 a. m., in the caucus room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon, Representative Durham (vice chairman), Senators Connally, Hickenlooper, Vandenberg, Millikin, Knowland; Representatives Holifield, Price, Kilday, Jackson, Cole, Elston, and Hinshaw.

Also present: David E. Lilienthal, Chairman; Summer T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Walter J. Williams, Director, Division of Production; Brig. Gen. James McCormack, Jr., Director, Division of Military Application; Lawrence R. Hafstad, Director, Division of Reactor Development; Paul M. Green, Director of Finance; Morse Salisbury, Director, Division of Public and Technical Information Service; and Francis Hammack, Acting Director, Division of Security; Fletcher Waller, Director, Division of Organization and Personnel; Joseph Volpe, Jr., General Counsel; all of the Atomic Energy Commission.

The CHAIRMAN. The meeting will come to order.

## STATEMENT OF DAVID E. LILIENTHAL, CHAIRMAN, ATOMIC ENERGY COMMISSION, ACCOMPANIED BY CARROLL L. WILSON, GENERAL MANAGER, AND JOSEPH VOLPE, JR., GENERAL COUNSEL, ATOMIC ENERGY COMMISSION

The CHAIRMAN. We are now ready to proceed, Senator. Have you a further matter that you wish to proceed on at this time?

Senator HICKENLOOPER. Yes. I would like to proceed this morning, Mr. Chairman—

Mr. LILIENTHAL. Mr. Chairman, may I make a statement?

The CHAIRMAN. Pardon me?

Mr. LILIENTHAL. Is it appropriate for me to make a brief comment on Senator Hickenlooper's figures as to what he described as a turnover—it will take just a moment.

Yesterday, figures were submitted, and an analysis has been made, or a preliminary analysis has been made, and I would like to report the results of this.

Senator HICKENLOOPER. Mr. Chairman, I would prefer to proceed with my matter this morning, which will be rather short, and I think after that we can go into the matters of yesterday, unless you prefer to do otherwise.

The CHAIRMAN. Well, I do not see that it makes a great deal of difference, so I suggest we proceed with the Senator's matters. When we finish, I will, of course, permit you to put into the record your analysis of these figures that were presented yesterday. I recall you stated you wanted to analyze and make some comment on them. So, you will be permitted to do that just as soon as we finish the present line of inquiry.

Senator HICKENLOOPER. Mr. Chairman, this morning I would like to lay before the committee information and facts with respect to the policy of the clearance of people for access to restricted data indulged in by the Commission.

I will call your attention to the fact that the Atomic Energy Act of 1946 has some very specific and mandatory requirements pertaining to the investigation and clearance of individuals prior to their employment in the atomic energy program.

The law clearly intends, and the committee drafting the law clearly intended, that before individuals were cleared for access to restricted data, the Federal Bureau of Investigation must conduct an investigation, and make a report to the Atomic Energy Commission as to the character, loyalty, and association of that individual.

We felt that in these troubled times, and because of the vital necessity for security, such a provision of law was necessary to prevent dangerous infiltration of our atomic energy program.

The law makes but one exception, and that is in section 10 (b) (5) (B) (i), and (ii), where it uses this language:

Except as authorized by the Commission in case of emergency, no individual shall be employed by the Commission until the Federal Bureau of Investigation shall have made an investigation and report to the Commission on the character, associations, and loyalty of such individual.

That is the end of the quote. This exception recognized that there might be cases where unforeseen circumstances and genuine emergencies might arise, demanding immediate action and immediate temporary clearance, but beyond any doubt the law intended such cases to be genuine emergencies.

Webster's Dictionary says that an emergency is "An unforeseen combination of circumstances that calls for immediate action."

My opinion of the meaning of "emergency," and the opinion of Mr. Webster in regard to the same is not, however, the opinion of the Commission.

In the year 1947, the Commission issued 818 emergency clearances with access to restricted documents.

The CHAIRMAN. How many, Senator?

Senator HICKENLOOPER. Eight hundred and eighteen emergency clearances with access to restricted data. That is without prior investigation by the FBI; and 419 emergency clearances without access.

This means that in 1947, 818 individuals were either given restricted data or allowed to work in restricted areas before the required investigation had been completed and evaluated.

I have remonstrated with the Commission in rather extensive correspondence with Chairman Lilienthal, dating back into 1947 on this

subject, and have been told that the Commission was keeping emergency clearances to the minimum. Reasons given for the high number of emergency clearances were, (A) the newness of the organization and, (B) being the length of time involved in investigation. That was for 1947.

In 1948, however, the second year of the Commission's operation, 2,103 persons were granted access to restricted data, or were given access to restricted areas without prior investigation. The situation has gone from bad to worse.

When I think of the evidence which has been presented to the world as to the nature of the tactics of the Communist Party, it is inconceivable to me that any responsible Government official would authorize such procedure. Already in 1949 there have been allowed 359 emergency clearances. I reiterate, 359 persons were allowed to have access to restricted data or to restricted areas, without prior investigation.

If these emergency clearances are granted at the same rate, the year 1949 will see at least 1,300 additional people allowed to have access to restricted atomic information prior to any investigation.

In the face of all the publicity which has been issued to the American public relative to atomic security, I consider this conduct of the Atomic Energy Commission and that of Chairman Lilienthal to be, in fact, brazen effrontery against the law of the land. I consider it to be a violation of the letter and the spirit of the Atomic Energy Act of 1946, and it is high time the facts are made known.

Now, I have here, Mr. Chairman, correspondence that I have had with Mr. Lilienthal, beginning in December 1947, when these extraordinary emergency clearances in such numbers began to come to my attention, and the correspondence extends.

The correspondence is marked, "To the Committee from the Commission," as confidential. I did not mark my correspondence with the Commission in any particular way, so far as I know. It might have been, but it is marked generally confidential.

I do not consider it confidential, with the exception of names of individuals which I would prefer to withhold; but I have for instance here, Mr. Chairman, the compiled reports containing the names, and I presume that is a good 3 or 3½ inches thick, a file containing the names of the emergency clearances granted by the Commission.

For instance, I have here the statement for March 1949, just last March, on top, showing that at Chicago, where recent unpleasantness has occurred, 56 persons were cleared in March with access to restricted data, according to the reports of the Commission. Nobody was cleared without access to restricted data.

The total in March of 1949 was 158 emergency clearances, and 158 cleared with access to restricted data.

Now, Mr. Chairman, I believe that it might serve no good purpose to put the records themselves, with all of the names, into the record, but I believe that if the committee so determines, that it would be very helpful in the record if the monthly summaries of the number of people and the location of the installations would be put into the record. In other words, we would show the number cleared in Chicago, Hanford, Los Alamos, New York, Oak Ridge, Sandia, Washington, and other places, just giving the total, and those cleared with access, and those cleared without access.

The CHAIRMAN. They are not classified as to the jobs they are doing, are they?

Senator HICKENLOOPER. The summary—let me show you the summary. It is part of the committee's files. It is stamped "confidential." I see nothing that could be confidential about that. I could see that there might be reason for keeping the names of the individuals and their jobs confidential, and therefore I suggest—

The CHAIRMAN. My point is, Senator, that they are not set down by classification, so many records—

Senator HICKENLOOPER. But they are in the records.

The CHAIRMAN. Yes; but not in the summary.

Senator HICKENLOOPER. But in the document that you have, the summary that you have, they are not so broken down.

Now, the committee can go through this and see the number of chemists, and technicians, and engineers, and scientists, and others who are temporarily cleared, but I would suggest unless the committee desires to order otherwise, that only the monthly summaries be put into the public record.

The CHAIRMAN. Well, at least for the present we will do it that way. It may become material to put in the record later just exactly what kinds of jobs these people were doing and what jobs they were going to fill. At that time it can go in.

(See exhibit No. 4 in the appendix to follow the last part of these hearings.)

Mr. COLE. Mr. Chairman, it would seem to me that it would be pertinent at this point for Senator Hickenlooper to indicate the type of work, in a general way, that these individuals are engaged in, to whom restricted data is accessible; just in a general way.

Senator HICKENLOOPER. Mr. Chairman, I think I can do that without giving names.

Mr. COLE. Are they janitors?

Senator HICKENLOOPER. I will take one area, depending upon the particular type of work at the installation. This is typical of a scientific laboratory, I believe. I will give you the general descriptions. All of the persons in the report on this area have been cleared during the month of March 1949, with access to restricted data, and on an emergency basis, and without a prior investigation.

For instance, here is a research associate, a director of public relations, a laboratory foreman, a chemist, a stenographer, an assistant to the director, a junior engineer, a secretary, a pay-roll clerk, an engineer, an assistant librarian, a physicist, an engineer, a guard, a superintendent of stores, a clerk-typist, a senior engineer, a superintendent of police, a research engineer, a stenographer, a clerk-stenographer, a clerk-typist, a research associate, a research engineer, a technical and administrative supervisor, a guard, a detail draftsman, a fire chief, a superintendent of photography—and may I point out, Mr. Chairman: one is a superintendent of photography, and at this point I want to call your attention, Mr. Chairman, to the fact that we have two or three sergeants, one of whom was a photographer who took some pictures of some things that he worked with, and he is under a very severe sentence today for his actions. We have an audit clerk, a guard, a secretary, a stenographer, an illustrator, a technician, a mail clerk, a librarian, a secretary, a secretary, an attorney, a design

engineer, an engineer, a superintendent of purchasing department, an engineer, a secretary, a clerk-stenographer, a research engineer, a superintendent of industrial relations, a senior engineer, a stenographer, a research engineer, a technician, a superintendent of blueprint department, a student engineer, an engineer, a member of the local personnel review board.

The CHAIRMAN. I think that gives us an idea.

Senator HICKENLOOPER. I have just four—so that I can complete this particular list: a sales engineer, a secretary, a secretary, and a sales engineer.

I did not want, Mr. Chairman, to pick out just a few key important offices, but in this list I think it is abundantly clear that these are pretty top-flight people in the technical and scientific end of this thing, all of whom were cleared in the month of March for access—with access to restricted data, as shown by the records of the Commission, and that is in one area which I can go into. I can go through other areas, but they are typical, I assure you, in keeping with the particular job that the area has to do.

Senator KNOWLAND. Mr. Chairman, I wonder if right at this point the Senator would make some inquiry so that the committee might be fully informed as to the process of who actually makes the clearance. In other words, whether it is a security officer who is responsible for making it; whether it is the General Manager; whether it is the Commission as a whole, or what is the process of giving these emergency clearances.

Senator HICKENLOOPER. Mr. Chairman, I would say to the Senator from California, that I would like to just outline this, and then I believe we should have comment from Mr. Lilienthal, or whoever cares to comment, on the procedure and some explanation of what I think to be an astounding situation in the face of the law.

Now, as I pointed out, Mr. Chairman, in 1947, 818 people were given emergency clearance without investigation prior to their going to work, and with access to restricted data.

Four hundred and nineteen were given emergency clearance—did I say “without access”? I meant 818 persons were given emergency clearance prior to any investigation by the FBI and cleared with access to restricted data.

In the same year, 1947, 419 people were given emergency clearance without access to restricted data.

Now, the reason was given, Mr. Chairman, in my correspondence, that it was a new enterprise and there were so many things that had to be taken care of that really it constituted an emergency so far as employment was concerned. But let us move on the second year again.

The second year of operation, in 1948, instead of 818 people being cleared on an emergency basis, with access to restricted data, 2,103 people were given emergency clearance with access to restricted data, and only 141 people in 1948, instead of 419 as in 1947, were cleared without access to restricted data.

Now, in the first 3 months—and those are the only figures I have up to date, January, February, and March, 1949—359 people have been cleared for access or with access to restricted data, according to the Commission's reports, and no people have been given emergency clear-

ance without access to restricted data, so far as reports of the Commission to the joint committee show.

Now, I may say that, just by way of illustration, at Chicago, to which I referred awhile ago, in January, February, and March, at the installation at Chicago, there were 95 people cleared with access to restricted data, without any FBI investigation and cleared as emergency clearances.

In May, I do not have any figures, Mr. Chairman, because they have not been reported.

Now, I think, perhaps, that at this point it would be only fair to say that most of these people who have in the past been cleared with access to restricted data on an emergency basis have later proved to be, on examination and investigation by the FBI, good citizens and trustworthy. I think the overwhelming number of American people and the cross section of American people are good citizens and trustworthy.

It is not the mass of employees who infiltrate or use these techniques; it is the occasional person who, by carelessness, slips through the loopholes and gets into our vital installations by subterfuge. That is the dangerous person. And it is entirely possible that with such practices, a number of subversive people could be cleared on an emergency basis, and then rest assured that they would have anywhere from 60 to 90 days' time before their investigation would be complete and any of their background would be caught up with or would catch up with them.

There is the genuine and real danger of such practices.

Mr. Chairman, I have been in this matter, and the matter has been before the committee in times past. I have passed the file of the correspondence down to you and other members, so it is not a new matter. It is a matter that is, as I say, one in which I have had considerable correspondence with Mr. Lilienthal, because I felt for a long time that it was a dangerous practice, that in view of the strict provisions of the law, that it was contrary to what we thought we were providing to safeguard work in the atomic project, and especially work in the restricted and classified areas; and I suggest that, Mr. Chairman, as a matter for the very serious consideration of the members of the committee, not only as to policy, but I submit it and suggest that so far as my opinion is concerned, as a member of the special committee that sat with you on your bill and as a member of the Joint Committee on Atomic Energy, so far as my personal opinion is concerned, that is in contravention of the law, and in very substantial contravention of the intent and letter and the spirit of this law, to safeguard our affairs.

I am perfectly ready for any comment that the Commissioner, Mr. Lilienthal, or anybody else has to make about this matter.

The CHAIRMAN. All right, Mr. Lilienthal.

Mr. LILIENTHAL. Mr. Chairman and members of the committee. As Senator Hickenlooper has said, the question of the exercise of judgment in the administration of the Atomic Energy Act by the Commission staff, and the granting of emergency clearances, or clearances authorized by law in the event of emergency, has been the subject of a good deal of discussion in hearings before the committee and in correspondence.

I would say that any fair-minded person would recognize that the problem of what constitutes an emergency justifying the exercise of

emergency powers, is not something that can be spelled out in detail. It is a matter of judgment. The very fact that the statute recognized the necessity for granting of clearances in emergencies even before the committee which drafted this act and the Congress which passed it had before it the facts of emergency, indicates that there was in your minds and in the minds of the Congress and in the minds of all fair-minded people a realization that emergencies would arise, and that the question of whether this power was wisely exercised would raise doubts and differences between equally patriotic and equally reasonable people.

I am glad and relieved to have the Senator's comment, Senator Hickenlooper's comment, that most of these people who were granted emergency clearances were, in fact, loyal, patriotic, and beyond that kind of question which this act raises in the terms "loyalty, association, and character."

Since this list included emergency clearance for such people as General Eisenhower, I am sure he, too, will be relieved that there is no blanket claim against all these people. As a matter of fact, the record is clear that there are very few individuals in all these emergency clearances about whom subsequent investigation revealed anything of consequence.

Senator HICKENLOOPER. In view of the fact that Mr. Lilienthal has mentioned General Eisenhower, whom everybody respects, I may suggest a few others who do not have the standing or trust of the American people that General Eisenhower has, who have been cleared.

Mr. LILIENTHAL. I was referring to the Senator's general comment that these people who have been granted emergency clearances were not, as a group, nefarious.

I am also on the general question of how successful the Commission has been in carrying forward this undertaking under emergency conditions, to which I would like the opportunity of referring at some length this morning, so that the committee and, more particularly, the country know that we were in an emergency situation. I would like to eliminate, as I believe we may eliminate, on the Senator's, Senator Hickenlooper's own statement, any general or blanket indictment or question of suspicion about the personnel of the Atomic Energy Commission or its contractors.

On the 12th of May, which is by the calendar a very short time away but in other terms of relativity, so far as I am concerned, several years past, Senator Hickenlooper, in the course of a hearing on the confirmation of Gordon Dean and Dr. Smyth, made the following statement—and I am quoting from page 13 of the hearings before the Senate section of the Joint Committee on Atomic Energy, Eighty-first Congress, first session, printed record:

I might say—

Senator Hickenlooper said—

just to clarify this situation, that I think the record of loyalty and character in this whole project from the Manhattan District down to the present time through the present Commission has been of an unusually high order. I think the percentage of undesirable people who have occasion to have access to restricted data is remarkably low and indicates a standard that probably could not be excelled and, perhaps, not even equaled among any other group or class of people, so I do not take the attitude that everybody is bad.

I think the facts require such a statement, and I think it is important to eliminate any possibility of anyone's mistaking what I believe to be Senator Hickenlooper's point.

On the matter of emergency clearances, it is known to the members of the committee but it is important to restate it in public, that Admiral Gingrich, the Commission's Director of Security, and other staff members, I believe, appeared before one or more hearings before the joint committee on this question of emergency clearance, discussed the problems that were faced by the Commission, discussed the procedure that was applied with respect to emergency clearances, explained as best he could, and as best those could who were associated with him and who had this responsibility, the necessity for this procedure.

He also explained, it is my recollection—if he did not, I will repeat—that emergency clearances were not granted without a screening process, that is to say, no one has been granted an emergency clearance, to my knowledge and understanding and belief, who did not first of all have an FBI file check. This was a measure of prudence which has turned out to have been well taken—and eliminates, too, from this issue of emergency clearance, which I believe to be a matter of difference of judgment between Senator Hickenlooper and those of the Commission who have responsibilities for getting things done, and weighing all the factors—this eliminates, too, from the issue, any suggestion that these people were granted emergency clearances without any investigation at all.

This is not the case, and if any members of the committee care to have further elaboration of this screening process, of this file check, and of the results achieved by this preliminary inquiry, I think it might be interesting.

At first this authority to grant emergency clearances was limited to the Director of Security, and later on, as operating problems arose, and the operating managers in the field became more and more aware of the standards and criteria developed, and were themselves cognizant of the emergency conditions that they faced requiring prompt action, a portion of this authority was delegated to the field.

Senator HICKENLOOPER. Mr. Chairman, I would like, if Mr. Lilienthal would comment on this point: The fact that on several occasions I wrote, in behalf of the committee, to him, and asked if changes in the law were indicated or if there were any need for amendment of the law, and each time we eventually got a reply back that there was no change indicated in the law.

Now the point is, among other things, if this emergency clearance business was so vital, my opinion is that it is in direct contravention of the law, and if a change in the law had been needed, it should have been recommended, and that we should proceed by law and not by circumvention of the law.

I mean if eventually you will, I would like to have you comment on that point.

Mr. LILIENTHAL. I would like to comment on it immediately, if I may, Senator.

Back in December of 1947, Mr. Joseph Volpe, Jr., the present General Counsel of the Commission, then its Associate General Counsel, discussed these provisions of law, this provision of law for emergency clearance, with the Attorney General at some length, and with his associates. I participated in one of these earlier discussions, and then,

thereafter, the results of that discussion with the chief law officer of the Government were discussed by Mr. Volpe with Senator Hickenlooper.

Mr. DURHAM. What date was that?

Mr. LILIENTHAL. In December 1947, Mr. Durham.

The point of this is that the Commission's conclusion, the Commission's adoption of the recommendation of its counsel, that no change of law was required in order to make the kind of headway that was expected of us, was not a casual one, and was one that was discussed at considerable length, and one of the reasons for this was the necessity for emergency clearance of military personnel, but there were other legal questions involved.

All I am saying is that this was regarded as a matter of importance, and was discussed, not once, but more than once, with the Department of Justice, and with the Attorney General.

So, I suggest, in responding to the criticism of the exercise of the Commission's judgment in granting emergency clearances, that our problem was one of judgment; that is to say, Admiral Gingrich, as Director of Security, and later those others who had the authority delegated to them, the authority to grant emergency clearances—I may say these did not come to the Commission and should not come to the Commission, it seems to me, under good organization—had this problem, this question of judgment: to weigh the responsibility we owed the country to increase the security of the country through rapid progress, to shore up things that needed shoring up; to take new steps, adopt new programs; to weigh these against the risk, the calculated risk, of a screening, a preliminary screening, which would avoid from 60 to 90, and in some cases 120 days of delay for a full FBI investigation.

We submit that, on the record, that exercise of judgment was neither arbitrary nor whimsical. We believe it to have been sound.

I just repeat that it required, particularly in 1947 and 1948, an extended period for a full FBI investigation, as distinguished from a file check, to see whether these individuals had records that would raise a doubt about them.

The CHAIRMAN. Do you mean there was a file check made before this emergency clearance was granted?

Mr. LILIENTHAL. In no case, Senator McMahon, did Admiral Gingrich, or later the managers of operation, grant an emergency clearance until an FBI file check had been made.

The CHAIRMAN. Now, suppose you describe what a file check means, because it may be that we do not all understand it. I think it would be a good thing to have it in the record.

Mr. VOLPE. Senator, a file check means obtaining from the individual a P. S. Q.

The CHAIRMAN. That is a personal security questionnaire?

Mr. VOLPE. A personal security questionnaire, in which he lists all relevant information about himself and his background.

The CHAIRMAN. Now, is that the kind of a questionnaire all employees of the Federal Government fill out, all applicants?

Mr. VOLPE. Yes; that is right.

The CHAIRMAN. That is correct.

Mr. VOLPE. And, as a matter of fact, we have made some innovations of our own to cover certain situations. This P. S. Q. is then sent to the Federal Bureau of Investigation, along with a fingerprint card, which is obtained from the individual, and the FBI then makes a check of its records, using the information furnished on the P. S. Q., and also using the fingerprints which have been furnished by the individual.

A report is then made to our security office, and in these cases if the report indicates any derogatory information, it is my understanding that no emergency clearance was granted.

If the report, on the other hand, was clear, then the emergency clearance was granted, and as a part of that screening, the security office would examine carefully the information furnished by the individual so as to be certain that there was no information in the P. S. Q. itself which would raise some doubt.

The CHAIRMAN. Is the P. S. Q. sworn to?

Mr. VOLPE. Yes.

Senator HICKENLOOPER. Mr. Chairman, may I just ask Mr. Volpe about that?

The CHAIRMAN. Yes.

Senator HICKENLOOPER. Mr. Volpe, you know of one case, do you not, where a man made out his P. S. Q. and swore to it and it later turned up that he had been a member of the Communist Party, and a very active cell of the Communist Party, and he did not put that on his P. S. Q., and there was no record in the file check on it.

The CHAIRMAN. Did he have emergency clearance?

Mr. VOLPE. Senator, there was not any emergency clearance.

Senator HICKENLOOPER. I understand, but I am talking about the P. S. Q.

Mr. VOLPE. Yes, Senator. This was an individual who had been employed by the Manhattan District in 1943, and who, upon reinvestigation, had this information developed.

Senator HICKENLOOPER. Yes, but the P. S. Q. is not a sacred assurance at all.

Mr. VOLPE. Senator, the P. S. Q. which was used by that individual at that time is not the same P. S. Q. which is now used by the Government.

Senator HICKENLOOPER. Yes. But may I ask you this hypothetical question: Let us suppose that a subversive desired to become infiltrated into this program. If he is a subversive and has designs upon information which he would like to use to the detriment of this country, do you believe that if he thought he had no record any place, he would put down on his P. S. Q. the derogatory information of that kind? Do you think he would put down that derogatory information if he were engaged in subversive activities or intended to—

Mr. VOLPE. Yes. Senator, this has been a matter which has been of considerable concern to the Atomic Energy Commission, to the Manhattan District before it, and to all agencies of Government which are concerned with security problems.

The thing that worries us most is that in the course of an investigation nothing will turn up which indicates that the individual is in any way connected with subversive activities and, as a matter of fact, it has been our fear that if an individual wanted to get into the project, he

would probably put in someone who never belonged to the Communist Party, who never belonged to a front organization.

Senator HICKENLOOPER. That is exactly the point.

Mr. VOLPE. That is right, sir.

Senator HICKENLOOPER. Exactly.

Mr. VOLPE. But this is a problem which we face even with a full FBI investigation, Senator.

Senator HICKENLOOPER. That is right. But in my judgment that is not any excuse for not going to the greatest possible limits to be assured that the infiltration of the dangerous few—not the overwhelming number of Americans who work in this project—they have to be examined under the law the same way—but it is to guard against the occasional infiltration of the dangerous subversive, and I submit that the P. S. Q. and the simple file check, which means nothing but looking in the FBI files and seeing if they have ever heard anything about this fellow or ever had anything on him—a file check is not an investigation, and if there is nothing in the FBI files or the other investigating agencies' files on this individual, the P. S. Q., plus the file check, gives no assurance or no reliability at all with regard to the subversive.

Mr. VOLPE. Senator, may I merely make this comment on that? I think this country can be proud of the record of the Federal Bureau of Investigation. I think that the Federal Bureau of Investigation is probably—I am sure it is—doing an excellent job of keeping tabs on subversives. I have had some experience with this problem for the past 6 years.

Senator HICKENLOOPER. Suppose a fellow gives a wrong name, suppose his name is one thing and he gives another name?

Mr. VOLPE. Senator, the FBI, I am sure, is very much aware of even that problem, and I am sure they are aware of other tricks which, perhaps, we do not even think of ourselves; and it is our feeling that if we submit enough information to the FBI on an individual, the FBI will certainly be in a position to let us know whether or not this individual is one of these dangerous characters.

Senator HICKENLOOPER. How, if they have nothing in their files? On the file check they do not go out and investigate. They merely write back to you and say, "We have no information in our files on this individual," or state "For some reason or another in the past we have had occasion to have some information."

Now, on the individual, where they have no information in their files on that individual, they do not affirmatively go out and check when you request a file check.

Mr. VOLPE. Senator, the FBI is not investigating subversive activities in the United States in behalf of the Atomic Energy Commission. The FBI has separate jurisdiction for the investigation of subversive activities which has nothing to do with the Atomic Energy Commission, as such; and what I am saying is that for years the FBI has been very much aware of the problem of subversive infiltration, and I am sure that they have developed as much information on subversive activities as they possibly can, without our submitting to them a single P. S. Q. for investigation of a single individual.

Mr. LILIENTHAL. May I add this comment that if—

The CHAIRMAN. May I just make this comment?

Mr. LILIENTHAL. I am sorry.

The CHAIRMAN. Pardon me. Of course, they might submit a different name, but they cannot submit a different set of fingerprints.

Mr. VOLPE. They could not, sir.

Senator HICKENLOOPER. Suppose their fingerprints have never been taken, and suppose the whole P. S. Q. is falsified? The only way for a check on it is for the Federal Bureau of Investigation to check the references and check the associations of these individuals.

So, I submit that merely the submission of a P. S. Q., and then asking the FBI if they have anything in their files on this individual, is an utterly unreliable protection against the subversive who is determined to infiltrate.

Mr. VOLPE. Senator, I want to make this point very clear because I think it is important on this whole question. The Federal Bureau of Investigation has been investigating subversive activities and Communists for many years.

Senator HICKENLOOPER. Granted.

Mr. VOLPE. They are not investigating these matters only today because of the atomic energy program; and the only point I wish to make is that if there was any way possible for the FBI to find out where subversive individuals might be in this country, where Communists might be in this country, who are attempting to infiltrate into the Government or into secret activities, I am sure that the FBI would have this information today without a P. S. Q. from the Atomic Energy Commission.

Senator HICKENLOOPER. I agree with you that they have a fine organization, and they have done a vast amount of work. I am not talking about the fellow who gets a soap box and makes a speech where everybody knows he is advocating subversive things.

I am talking about the diabolically clever sabotage and the diabolically clever infiltration that a determined espionage system and a cleverly organized espionage system would use, and they manifestly are not going to use people who have a record at the FBI or whom the FBI have previously investigated.

They will use people, and I submit, even to the point of complete falsification, where they know it is only a file check, and if they know that it is going to take 60 to 90 days before an investigation can be completed, they may be able to do a great many things in that period; and I am referring again only to the rare instances in this very vital project where espionage may infiltrate, or subversive activity, and not the overwhelming number of people who have good records and are perfectly all right.

Mr. VOLPE. Senator, while we are speculating on what might happen, what could happen, I would like to make this comment, which is an educated guess on my part, and that is that this diabolical individual, this conniving character, is probably not going to expose himself by filing a P. S. Q. and fingerprints which he knows will go to the FBI.

Senator HICKENLOOPER. Well, he can very easily, as long as we are speculating—I think it has been done—he can very easily infiltrate himself into the organization, stay 30 or 60 days, and then maybe a Polish boat will let him get on, and he can pay his passage, and the British courts will free him, and he can go back to wherever he wants to go.

Mr. VOLPE. Senator, the point is that he does not come into the program until there has been the fingerprint card, and until the fingerprint card has been scrutinized by the FBI. Until that is done no clearance is given and no one comes into the program.

Senator HICKENLOOPER. I do not care to continue with this, but if you just take the case where there is no fingerprint record with the FBI—I do not suppose everybody in this room has a fingerprint record with the FBI; there are millions of people in this country who have no record of their fingerprints with the FBI.

Mr. LILIENTHAL. You would be surprised how few there are, or dossiers either, for that matter.

May I suggest, that this question of emergency—

Mr. DURHAM. Mr. Lilienthal, will you elaborate just a little bit further on the words “shoring up,” what that means? It is rather indefinite.

Mr. LILIENTHAL. Yes.

Mr. DURHAM. Before you leave that.

Mr. LILIENTHAL. Yes, Representative Durham.

Mr. DURHAM. You were primarily using this, as I understood you to say, you were primarily using this to “shore up.” Will you elaborate on that a little?

Mr. LILIENTHAL. What I had in mind was, after suggesting that Congress must have had it in mind, that there would be emergencies justifying this action or there would have been a flat rule that no one under any circumstances may be admitted to this undertaking without a full FBI investigation.

I think myself that the logic of the Senator, Senator Hickenlooper’s argument, leads to the point where if we are going to try to provide a completely riskless situation, then a great deal more than an FBI, a full FBI, investigation will be necessary.

Now, I would like to go back to the question of the general setting because I think here the question is one of judgment. The law does provide for emergency clearances, and it must mean something; it must give some discretion to the Administrators or it would not have been put into the law, and the set of facts to which you have referred really relate to Mr. Webster and his definition, as I recall it, of unforeseen circumstances requiring immediate action.

I do not say that this test applies to every one of these emergency clearances, even to the same degree, but I think the committee is entitled to have some understanding of the circumstances that were faced, and that have accounted for a very considerable number of these emergency clearances; the sets of facts upon which the judgment is exercised, and having those sets of facts, or part of them, one is better able to decide whether the judgment was exercised well or badly.

Senator HICKENLOOPER. Mr. Chairman, at that point may I suggest to you, because you were chairman of the committee that considered your bill, and there are several members of the special committee now on this committee, may I suggest my recollection of the discussions that the committee had with respect to this very matter of emergency clearance when the law was prepared?

It is my recollection, and my firm belief, that we discussed very thoroughly the desirability and the necessity for everyone who had access to restricted or within restricted areas should be first investi-

gated, but we also said there may be occasions when it will be highly essential to get a highly specialized individual to do work immediately necessary, and when—if and when those occasions occur, we should put in some leeway so that a specialized individual, either a highly trained technician, a highly specialized scientist, an able engineer, might temporarily be brought in for a specific piece of advice or a specific piece of work and, therefore, we discussed the connotation of that emergency exception that was put in there.

Now, there are five of us sitting here who were on that special committee. I have tried to express my understanding of what we tried to write into the bill on emergency clearance, and if there are other and different understandings of the vital necessities of this and the restrictive nature of this emergency, I would be very happy if other members who had gone through that experience would care to comment.

Senator MILLIKIN. Mr. Chairman, may I make a comment on this thing?

The CHAIRMAN. Yes, Senator.

Senator MILLIKIN. I would like to suggest that the whole Atomic Energy Act was framed in terms of security. We gave the Government a complete monopoly. Many of us had to change our philosophy entirely to fit the security needs of the situation.

It is true that these matters come down to judgment, but merely saying, "We are exercising judgment," is no defense. It is the quality of judgment that is on trial.

The CHAIRMAN. Now, will you proceed, Mr. Lilienthal?

Mr. LILIENTHAL. I would like to respond to Vice Chairman Durham's question and, at the same time, include—and by the same language include—a comment on Senator Millikin's statement.

It is precisely because the paramount responsibility is security that in most of these instances the statute provided for emergency clearance, and the emergency clearances were granted.

Security in the real sense is a question of whether the country's strength is increased by the actions of the Commission, and not limited to such questions as the clearance of individuals, and I can illustrate by five or six different types of situations.

I hope I will have an opportunity to do this, because I think this will indicate a little more clearly what security really means today, and what the security situation we faced was.

To think of security only in terms of protective devices, of protection, of fences, of padlocks, and safes, and of the examination of the backgrounds and loyalty of individuals, is, I think, a very grave mistake.

Now, just last Monday, an associate of mine and I discussed with two of the most important industrial executives in the country the question of their willingness to undertake a measure at Sandia Base where weapon engineering goes forward, that will immeasurably strengthen the security of this country in an affirmative sense.

The problem of these discussions that is raised at once is this, and this situation has been reported to the joint committee as a pending matter—and I trust that the names of the company will not be disclosed at this time lest it may interfere with the discussions—this situation of calling in these companies to increase our security at Sandia means an increase in our security in the engineering, deliver-

ability, and usefulness of the atomic weapon, something that is a very important item indeed, and will relate to quantities of production. This is a form of real security. In order to discuss this matter, should we wait with an urgently needed matter 60 or 90 days until a full FBI investigation is made?

I recall that Charles Wilson, of the General Electric Co., had a full FBI investigation which took a long time. I do not myself see how the FBI has been able to carry the load and do as prompt a job as they have. I think it is an amazing thing, but nevertheless these things take time.

This is a question of judgment. It was perfectly clear to me, and I believe it will be clear to everyone, that here is the sort of situation that is contemplated by the term "emergency clearance," and that some of these top executives and their counsel should be screened by the FBI to see whether they are in fact what they appear to be on the surface, highly reputable citizens, and then be given them an emergency clearance, subject to a more extended clearance.

Now, projects of this kind are coming up all the time. If this were a static undertaking it would be secure in the sense of observing these protective matters, but it would not add to the security of the country in the way which, before this hearing is completed, the country will learn it should.

Let me take another illustration, and this relates to the term "shoring up," Mr. Durham.

In 1947 and 1948 the Commission became fully aware, and this committee was advised, that there was an emergency in security of the country at Hanford. There was a threatened stoppage, a threatened break-down of pile operation from which plutonium is made, plutonium for weapons. These were due to technical difficulties.

The country's security was endangered by that. Speed in doing something about it was essential.

One of the things that had to be done was the reactivation of the building of new plants, new industrial plants, not at Hanford but elsewhere, to provide the materials to go into new piles for additional production needs, and for other purposes.

To lose 60 days or 90 days at that juncture was a very serious, worrisome thing, in the kind of responsibility it was for us to take.

Senator HICKENLOOPER. Mr. Chairman—

Mr. LILIENTHAL. May I finish this sentence—and this is precisely, we believe, the kind of situation which the emergency clearance provision of the law contemplated.

Senator HICKENLOOPER. Mr. Chairman, may I ask Mr. Lilienthal a question?

Mr. Lilienthal, may I ask if in fact the situation at Hanford was not well known and recognized at the time the Commission took over?

Mr. LILIENTHAL. It was well known, but it certainly was not recognized in the sense of doing something about it.

Senator HICKENLOOPER. So that it was not a sudden emergency that came up within 60 days, a 60-day period. It was a condition that had been recognized, and it was realized that some solution to the problem had to be found.

Mr. LILIENTHAL. Well, Senator, it may not now, since the problem is now solved, seem to be a very urgent or sudden thing.

Senator HICKENLOOPER. No; I do not mean to minimize it.

Mr. LILIENTHAL. But at that time it seemed very sudden and urgent.

Senator HICKENLOOPER. I do not mean to minimize the seriousness of the situation. The point I am making is that the situation was realized and was fully realized that some situation had to be worked out. It was not a sudden emergency that came up figuratively overnight.

Mr. LILIENTHAL. I must regretfully disagree with the Senator. I mean it is easy to be calm and relaxed about these things now that the facts are known. However, to do something about it, this was the important thing, and do something about it in a way that would cut every possible corner that could be cut under this law, with the exercise of good judgment, seemed to be an urgent necessity.

Let me take another illustration, and that involves a contract with the Bendix Corp., a very outstanding company in this country: The nature of this contract has been revealed to the joint committee as part of our duty to keep them fully informed. It is not one about which one should discuss in an open hearing, but all I need to say is that it was vital to the security of this country, just as vital as the fences and the personnel clearances and the safes and the vaults and the property accountability. I would say, in my own opinion, even more vital.

Now, there again was something that needed doing and needed doing urgently. Had we not moved with a sense of urgency, it would have been exceedingly appropriate for this committee—and I have no doubt it would have occurred, that if we had taken delays in discussing the terms of an arrangement with Bendix, delays that were occasioned by the 60- or 90-day period required for a full FBI investigation as distinguished from a file check such as we had used, we would have been castigated, and properly castigated, for not using the very provision of law which Congress put in to meet that situation.

Let me make another illustration.

Senator MILLIKIN. Let me ask you this before you get to the other illustration. I am very much interested in the illustration which Mr. Lilienthal has been giving us, but where there were 2,103 such emergencies in the year 1948—

Mr. LILIENTHAL. Not individual emergencies; no. I would like to bring out in terms of Representative Durham's question, to which I have been responding, that it takes all kinds of people to get these urgent things started. You cannot just talk; you cannot just clear a top executive and expect him to make headway, and these people cannot go around—they require clerical and other assistance, and to be honest about it, those people, those people, too, should be cleared, so that this is not just a matter of the individuals whose ultimate decision will be affected in these negotiations or discussions, but of other people in connection with them.

Let me take another illustration that I can give.

Mr. COLE. Mr. Chairman—

Mr. LILIENTHAL. Yes.

Mr. COLE. I think we are all aware of the fact that there have been situations which justified the exercise of the Commission's discretion with respect to the emergency situations, and those illustrations which Mr. Lilienthal has described are quite appropriate.

However, I would like to have you, Mr. Lilienthal, justify the emergency situation which would authorize your exercise of discretion for the employment of a file clerk or a secretary or a guard.

Now, it is in those areas which I can find criticism of the exercise of the Commission's discretion, because the law does not say that except, as authorized by the Commission, employment must be limited to those who are investigated by the FBI. It says, "except authorized by the Commission in emergencies."

Now, what possible emergency could arise which would require the emergency clearance of a guard, a file clerk or a stenographer, or an audit clerk?

Mr. LILIENTHAL. Mr. Cole, I appreciate very much the reasonableness of this question and of your comment about it, and the most explicit way to reply is that to make headway in these emergency situations clerks and file clerks and secretaries and guards are often necessary, and I think we can take some specific illustrations, not in this session, but in the form of a memorandum or a closed session, and illustrate this. You just cannot clear X, the head of a large concern, and his lawyer, and have them working on secret papers where you try to make headway fast and not give some clerical assistance to them or someone to guard the papers.

Mr. COLE. Is it your explanation and justification of this exercise of discretion then that each one of these instances of a guard or a stenographer has been necessary to clear that individual in order to make available to the Commission the services of some other individual?

Mr. LILIENTHAL. No, Mr. Cole, I would not do that, because I am not familiar with all these cases; I am familiar with the situation. I am sure that this explanation does cover a number of these.

There are such a variety of these pictures that it would be difficult to do otherwise than generalize, but we can analyze a great many of these.

All I am saying is that your question is a perfectly natural one, but the answer is not that a file clerk is not a chief executive of a company; a file clerk may be necessary as part and parcel—

Mr. COLE. Would you not agree that a file clerk or even a guard, if placed in the right position, might be just as dangerous or be in a position of being as dangerous in disclosing some elements of this program as a high, important person?

Mr. LILIENTHAL. Well, I would not believe so, but in any case there is a danger there.

Mr. COLE. You would not believe so? Is it not true that out in the place at Chicago that the secretary of one of the chemists has access to the combination of the safe where the important material is kept?

Mr. LILIENTHAL. Well, the reason I qualified my response is that while this would be dangerous and undesirable, highly undesirable, those people who have better understanding of the information they are getting are, I would say, the more dangerous, but it is a matter of degree.

If I may go on to a couple of these illustrations, I think we will clarify this point: The Commission, under much too short a preparatory period, Mr. Durham, set out to engage in tests of atomic weapons at Eniwetok as of April 1948.

Mr. DURHAM. That was requested by the military?

Mr. LILIENTHAL. This was initiated by the Commission, and warmly concurred in by the military.

Now, this was on a schedule, which, considering the magnitude of the operation and its complexity, the number of different kinds of people necessary, was shorter than would be wise or desirable, but it was the test which needed to be made.

As this preparation proceeded, and as 10,000 men of all kinds and descriptions from sailors and soldiers and M. P.'s to scientists in specializations, even the name of which most of us do not recognize, such as phenomenologists, and so forth, there appeared to be a number of places where additional information or additional skills would make the tests that much more valuable, and time was of the essence, because these things had to be timed down almost to the hour because of the long line of logistical problems of carrying it forward.

There again we were faced with this problem of judgment. Should we take the time for a full FBI investigation of this individual and individuals connected with this work or with extra guards or with Army personnel?

When you are in a situation of that kind it is not as relaxing as it is here in the Senate caucus room after the tests have been successfully carried out, and I am sure there would be situations where it would be difficult for one to say that a particular judgment was a hundred percent correct; but I think the record will show that in the interests of furthering the security of the country—and this Eniwetok test was a very vital element in the security of the country—the decisions on emergency clearances there were not only within, we believe, the spirit and meaning of the law, based upon our discussions with the Attorney General, but were also within the discretion of those to whom this authorization was granted.

Senator HICKENLOOPER. Mr. Chairman, may I ask a question?

Mr. LILIENTHAL. If I may just finish—I am not familiar with all of these. We delegated to men of as good judgment as I know—I do not claim that every one of these cases represents, after the fact or even at the time, perfect judgment. This is not that kind of a world, but I do say that they do not represent incredible mismanagement.

Mr. DURHAM. I think you have pointed out two very definite cases to us, Mr. Lilienthal, where the emergency probably was justified, and that is why I think the charge that this emergency clearance is not useful, can be done away with, but you have pointed out two specific cases.

Senator HICKENLOOPER. Mr. Chairman, may I comment on that point?

The CHAIRMAN. Yes, Senator.

Senator HICKENLOOPER. I think it has been amply stated here that the Eniwetok tests were among the most highly secret and carefully guarded experiments and tests that we have had since we first tested the bomb in White Sands in New Mexico.

I also state to this committee that the committee knew the approximate time of the Eniwetok test weeks and weeks before the tests occurred.

There was, in my judgment, ample time for investigation of the personnel, and yet I submit, Mr. Durham, on that point, that, in the most highly secret and most carefully guarded experiment that we

had, many, many emergency clearances were given without any investigation by the FBI, although time was, in my judgment, available for such a situation.

Mr. LILIENTHAL. May I respond to that by saying, with all due respect to the Senator's judgment about this complicated enterprise, there are people who were faced with the organization and the carrying out of this enterprise who would not agree with the Senator, and they are available all the way from the commander of the task force down through the test director.

A few illustrations will indicate that having a few months or even a year and a half in advance of such a complicated and technical scientific undertaking does not give ample time for the contingencies that arise. I hope the committee will hear testimony on that.

The CHAIRMAN. It is obvious that we have got to put some kind of order on the questioning. Yesterday we went down the list. I tried to go down in the order of seniority on the committee and give the House Members and the Senate Members alternate chances to question.

The chairman does not desire to be arbitrary or to stop any member of the committee addressing any question he thinks pertinent at the time. I ask the members of the committee if they will cooperate as much as possible so that we can take the questions in order. In that way each member may have an opportunity to ask questions.

If that is agreeable to the committee, we will proceed in that fashion, although the Chair is entirely willing to be overruled if that is the judgment of the committee.

Senator Vandenberg?

Senator VANDENBERG. No questions.

The CHAIRMAN. Senator Connally?

Senator CONNALLY. No questions.

The CHAIRMAN. Mr. Holifield?

Mr. HOLIFIELD. In the conducting of the Bikini tests and the Eniwetok tests, did your Commission exercise the clearance procedure or was that delegated to, in the one case, Admiral Blandy and, in the other case, General Hull?

Mr. LILIENTHAL. The two cases were different. The Bikini test was prior to the organization of the Commission. That is to say, it was under the Navy.

Mr. HOLIFIELD. Confine your answer, then, to the Eniwetok test.

Mr. LILIENTHAL. Of course, the Bikini test was conducted without FBI investigation.

Mr. HOLIFIELD. And there were approximately 40,000 people there?

Mr. LILIENTHAL. I think that is roughly the number. The personnel security there was, I assume, carried on not by the FBI, but by Navy intelligence, and so on.

As to Eniwetok, the responsibility for access to restricted data, which would include access to the physical things that were done, physical equipment, let us say, at Eniwetok, and a great many other things, was the responsibility of the Atomic Energy Commission, although the undertaking itself was a joint undertaking with the Military Establishment. The standards of clearance, therefore, came under the Atomic Energy Act of 1946.

Mr. HOLIFIELD. That is true, but you had to proceed because of the number of people involved in the Military Establishment on recom-

mentations from General Hull as to emergency clearances of military personnel; did you not?

Mr. LILIENTHAL. Yes; it was worked out. Because of the practical problems faced, it was worked out by agreement with General Hull and his colleagues of the Military Establishment, and detailed analysis of how that was worked out could be submitted, probably ought to be submitted in closed session, but I am not sure about that.

Mr. HOLIFIELD. I would like to explore this emergency clearance procedure which you have conducted during 1947, 1948, and 1949 to date. The joint committee has been cognizant of this procedure, I might say.

As you have already testified, information has been brought to the committee during 1947 and 1948 on this procedure. I want to ask you if the joint committee has ever requested a discontinuance of the emergency clearance procedure that is used by your Commission.

Mr. LILIENTHAL. No; it has not, and may I supplement the answer by saying that there have been monthly reports on emergency clearances during almost all of this period.

Mr. HOLIFIELD. Has there ever been any attempt on the part of the joint committee to delineate the area of judgment which you use in emergency clearances?

Mr. LILIENTHAL. I am not aware that there has been. It has been discussed in meetings.

Mr. HOLIFIELD. It has been discussed, but there has been no conclusion of this committee transmitted to you either verbally or in writing in which you have been requested or advised to limit the area of judgment in which you have been granting these emergency clearance procedures?

Mr. LILIENTHAL. That is correct.

Mr. HOLIFIELD. There have been inquiries and there have been letters back and forth; there has been conversation on it, but there has been no conclusion of the committee attempted to be enforced upon you?

Mr. LILIENTHAL. No; the committee has not transmitted any conclusion. Senator Hickenlooper has expressed concern in these letters, but the answer to your question is "No."

Senator HICKENLOOPER. May I point out at that point that the joint committee has no authority to direct or order the Commission to do anything or not to do anything. Sole administrative power and authority is lodged in the Commission itself, and the joint committee is only a legislative body for the purpose of canvassing the needs for legislation.

Mr. HOLIFIELD. I accept the Senator's explanation and agree with it. That is why I did not ask the Chairman of the Commission if he had been directed or ordered. I asked him if he had been advised that the committee's wishes were that he should limit the area, and there has been no such advice given from the standpoint of collective committee action, to my knowledge.

Mr. LILIENTHAL. No; not to my knowledge, and no substitute criteria to those in use.

Mr. HOLIFIELD. On many occasions, when we have advised the Commission our wishes on certain procedures, those wishes have been respected and adjustments have been made in your program? I ask you that question.

Mr. LILIENTHAL. The views of the committee have been requested, and, when elicited, have received very great weight. I do not recall offhand whether specific recommendations have been made from the committee as a whole with the exception of the recent report by the Durham subcommittee on the natural-gas line, which was a specific—it was a report of the joint committee, which adopted the subcommittee's recommendation.

This was a case of a specific conclusion by the committee on the wisdom or unwisdom of a particular act, but nothing of that kind appeared with respect to emergency clearance.

Mr. HOLIFIELD. That is true. Now, the committee did move in an orderly way in regard to the Tennessee gas line, and we did make an investigation and did make a recommendation to your Commission. It is up to your Commission, it is true, as to whether you accept it or reject it. You have the power to either accept it or reject it.

Now, if this emergency clearance procedure, as has been painted this morning, has been such a grave danger to this program, and if there was a majority determination on the part of the committee that it was such a danger, I say that the committee would have also made a recommendation, as we did in the Tennessee gas line. That requires no answer.

Now, if this emergency clearance procedure was completely eliminated, would it have obstructed and delayed the production of fissionable material during the last 2 years?

Mr. LILIENTHAL. It would indeed, and the security of the country today would be weakened as compared to the present state of affairs, atomically speaking.

Mr. HOLIFIELD. Do you believe that you could operate at the present time and in the future an efficient and expeditious program if the emergency clearance procedure was eliminated completely?

Mr. LILIENTHAL. No; not if the conditions in the world and the obligations of this Commission remain what they are today.

Mr. HOLIFIELD. That is all, Mr. Chairman.

The CHAIRMAN. Senator Millikin?

Senator MILLIKIN. Mr. Lilienthal, in the light of your illustration, I will ask you again: Do you consider that we were confronted with 2,103 emergencies of the type that you have described in 1948?

Mr. LILIENTHAL. No. These are people, not situations, Senator.

Senator MILLIKIN. I understand that.

Mr. LILIENTHAL. Each individual is not an emergency situation.

Senator MILLIKIN. Did you have emergencies that called for that many emergency clearances in the year 1948 of the type which, in your judgment, is contemplated by the act?

Mr. LILIENTHAL. I believe the judgment exercised by those to whom this has been delegated was sound. I have already indicated that I, after the fact, probably could not subscribe to every single one, but I do believe emergency situations during those years did exist such as the law contemplates, which justified and made necessary, in the interests of the security of the country, these emergency clearances; yes, sir.

Senator MILLIKIN. Your answer is in the affirmative?

Mr. LILIENTHAL. In one case, sir——

Senator MILLIKIN. Is your answer in the affirmative?

Mr. LILIENTHAL. It was, sir, and I supplement by saying in the Bendix case to which I referred and which would be a very appropriate illustration, perhaps in an open session, but certainly in a closed session, there were hundreds of people involved, including all kinds of people, and the results achieved there will justify, the results achieved in terms of security of the country will justify, in my opinion and, I believe, in yours, on these facts adduced, the exercise of this authority.

Senator MILLIKIN. Has anyone suggested eliminating the emergency provision of the act?

Mr. LILIENTHAL. I believe not.

Senator MILLIKIN. I raise the question because one of my colleagues raised it. I do not recall any suggestion. The question is not eliminating the emergency provision of the act. The question is whether the emergency provision of the act has been applied right; is that correct?

Mr. LILIENTHAL. I believe that is correct. I want to call attention to the fact that if a standard is adopted that we must never take a chance on anyone, then that virtually does, by that process, repeal the emergency provision.

Senator MILLIKIN. Let me make an observation and then ask your reactions to it.

When we were making this Atomic Energy Act, the security matter had two aspects to it, sometimes described as the affirmative aspects and sometimes as the negative aspects. It seems both are affirmative; the terminology is not important.

We felt we had to guard the security of atomic energy in two ways until we got this world fixed up for peace. In one aspect of it we had to progress with making a weapon. That was essential to our security. In the other aspect of it we had to keep anyone else from having the energy until we did get the world fixed up for peace. That has sometimes been called the negative aspect of it. They are both affirmative; they are both, I suggest, interdependent. I do not believe that there can be any defense to carelessness in one aspect of it on the ground that there has been great progress in the other aspect of it. Do you agree with me?

Mr. LILIENTHAL. There could never be any defense to carelessness; that is right.

Senator MILLIKIN. That is all.

The CHAIRMAN. Mr. Cole?

Mr. COLE. Yes. Mr. Lilienthal, reverting to your final response to a question—

Senator MILLIKIN. Might I just make one more observation? It was our feeling that if the enemy, an enemy, ever got atomic energy before we did get the world fixed up for peace, that we could not have peace and, therefore, the negative aspect, if you wish to call it that, is just as important as the so-called affirmative aspect.

Mr. LILIENTHAL. It is implied in what the Senator said that there are problems where one has to balance between these two, and I am sure that this is implied in the reasonable way in which he has stated the problem.

The CHAIRMAN. Mr. Cole?

Mr. COLE. As I recall, in response to a question of Mr. Holifield you stated in substance that had you been unable to grant these emer-

gency clearances, the national security would have been seriously undermined.

Now, do you honestly feel or do you honestly intend this committee and the public to get the idea that your inability to have been able to hire a librarian or a file clerk or a guard at the time you might have wanted to use that individual or those individuals would have seriously interfered, jeopardized the security of the Nation?

Mr. LILIENTHAL. I want the committee to understand—and I would hope we can make some break-downs of these types of cases—that the standard was as I have suggested: That delay at this juncture would be more likely to impair the security of the country than the risk involved after an FBI screening in the manner described.

I have made it clear, I hope, that I do not and cannot underwrite the wisdom of the exercise of judgment in every one of these cases. Mr. Cole is familiar enough with the conduct of large enterprises to know that delegation of authority is essential. I simply say that has been the standard, and I believe an over-all look at the picture will justify the conclusion that this power was exercised in the interests of furthering the security of the country.

Mr. COLE. Then, if you are prepared to defend the exercise of this discretion to the ultimate of justifying the hiring of a stenographer or a librarian, then you must be prepared to confess that the Commission's personnel is destitute of competent persons to have been able to do that job who already had been cleared, it would seem to me.

Mr. LILIENTHAL. I think you will find that most of these are contractors' employees. Let me illustrate this point.

Taking an example of the librarian, the situation I am not familiar with, I believe would not represent it. Let me give you a case.

Mr. COLE. I realize those are extreme cases, just as the illustrations you used were extreme.

Mr. LILIENTHAL. This is not the case. Respectfully I suggest that an enumeration of the emergency situations we faced will indicate that they are common occurrences.

Let me take the case of the graphite plant. Here was the necessity of quickly activating a whole inactive plant and doing it in a hurry. This plant employed all sorts of people. You could not run it with just the president and the secretary of the corporation or the plant manager. You had to activate the plant as a whole, and this included file clerks and secretaries.

Members of this committee are aware how absolutely helpless a man is without his secretarial and clerical help, and, in the case of this project, without security officers and guards and all the rest of it. So we are talking about a whole situation.

Now, the question, I submit, Mr. Cole, the question as to the wisdom of the exercise of this discretion should be whether as of today or, as I would think more fair, at the time when this problem arose, whether we were justified in seeking to save from 60 to 90 to 120 days in the reactivation of a plant rather than in respect to the individuals involved.

Mr. COLE. There has been no reactivation of a plant such as you described since January of this year, has there? And it has been since January of this year that these stenographers and librarians and guards of which I speak have been granted clearance.

Mr. LILIENTHAL. I took the example of the activation of the plant as an example, and there are other examples of the same sort. My point is we are not talking about an individual emergency, but an emergency involving a considerable group of people in some instances.

If that entire group of people is not cleared or substantially that entire group, then you cannot meet the emergency in the time that you would like to meet it.

Mr. COLE. Then it is apparent that there have been instances when the Commission has granted not an individual clearance but wholesale clearance of individuals en bloc or as a group?

Mr. LILIENTHAL. Not wholesale in the sense that they were not screened.

Mr. COLE. Everybody was screened, even the individuals?

Mr. LILIENTHAL. But our need for graphite and the reactivation of this plant was such that it seemed to those to whom this was delegated—and I endorse it now, and I believe the results justify it—that this limited investigation was better than the delays in getting going with these piles that would have been involved, had this not been done.

I do not say this is a perfect decision. At the time it seemed the thing to do, and when you are faced with this kind of emergency, that is more or less the standard you apply.

Mr. COLE. Do you know whether the figures which Senator Hickenlooper gave to the committee with respect to these clearances include the contractors' clearances as well as the Commission's clearances?

Mr. LILIENTHAL. Yes, most of the clearances are contractors' employees, most of the emergency clearances.

Mr. COLE. Has there ever been prepared a delineation of the standards by which these area managers might exercise the discretion which you have delegated to them in the granting of emergency clearances?

Mr. LILIENTHAL. Yes, and this has been submitted to the joint committee.

Mr. COLE. Would you mind making a note and at this point put it in the record so that if it is not classified—and I assume it is not—it will appear here?

Mr. LILIENTHAL. Yes, sir, we will.

(The document referred to above is marked exhibit 5 and will be found in the appendix.)

Mr. COLE. That is all.

Senator HICKENLOOPER. May I suggest to Mr. Cole that in referring to clearances for contractors' employees, it must be borne in mind that the University of Chicago, which does highly technical and scientific work, is a contractor; that Carbon & Carbide at Oak Ridge, that does highly scientific vital work, is a contractor; that the University of California which does highly scientific work is a contractor; and that at Hanford General Electric, which operates that plutonium installation out there, is a contractor, and their employees are doing the actual technical, highly classified work.

The CHAIRMAN. Now, Senator Knowland?

Senator KNOWLAND. I would just like to have Mr. Lilienthal put in the record, if he could, on the number of these emergency clearances—818 for 1947, 2,103 for 1948, and 359 for the first 3 months of 1949—how many of those, if you can give us a break-down, were contractors' employees, how many were Commission employees, and how many were outside people who may have been invited by the Commis-

sion to examine the plants; and if you can, also give us the breakdown as between Los Alamos, Hanford, and Oak Ridge, and the other installations where those, we might term them visitors, were extended this courtesy.

Mr. LILIENTHAL. May we also include an analysis of those individuals who were at the time neither contractors nor their employees nor Commission employees, but individuals with whom prospective arrangements were being discussed, because this is a fairly typical situation?

Senator KNOWLAND. Anything that would outline your position on it.

Mr. LILIENTHAL. Yes, sir.

(The data referred to above are marked exhibit 4 and will be found in the appendix.)

The CHAIRMAN. Mr. Lilienthal, before turning you over to Mr. Price, I would like to ask one question which seems to me to be somewhat significant.

The people given these emergency clearances were later completely investigated by the Federal Bureau of Investigation?

Mr. LILIENTHAL. They were.

The CHAIRMAN. Have you any record, either in your head or on a memorandum available, as to the number given emergency clearances who were later discharged after the full FBI investigation was made?

Mr. LILIENTHAL. The answer is, there were very, very few, extraordinarily few, and that the risk turned out to be less even than one might have feared, and we will get those figures into the record, but they are very, very few indeed.

The CHAIRMAN. I think it would be well if you were to give us that and also how many quit before the full investigation was completed. Can that be secured, Mr. Volpe?

Mr. VOLPE. Yes.

(The data referred to above are marked exhibit 6 and will be found in the appendix.)

The CHAIRMAN. Now, Mr. Price?

Mr. PRICE. Mr. Lilienthal, in connection with the Eniwetok test, to your knowledge, was there ever any breach of security?

Mr. LILIENTHAL. I am unaware of any breach of security in connection with the Eniwetok test.

Mr. PRICE. I wonder if you could give us some idea of the record of cooperation between the armed forces and the Commission during these tests.

Mr. LILIENTHAL. Yes. I should like to. The joint task force was a real case of unification that succeeded. It was not only unification of the three services, but also of a rather large technical group, who in the past have not always unified very readily.

There have been written statements prepared and supplied to the joint committee, and I should like and think it would be very pertinent, if we had permission to insert them in the record here, the views of a number of different kinds of people, responsible people, as to the success of this operation jointly with the Military Establishment in this very complicated operation. These would include the views of the late Secretary of Defense, Mr. Forrestal; of the commander of the

joint task force, General Hull; of the scientists of the Los Alamos laboratory; of all of the various segments involved.

The CHAIRMAN. Very well. You may supply that.

(The data referred to above are marked exhibit 7 and will be found in the appendix.)

Mr. LILIENTHAL. I would like to elaborate the record on this, although I do not have it in mind in terms of documents that pertain to this subject, because to over-all appraisal of stewardship this Commission bears to this committee and to the country, the success from a management point of view of this unified operation, I believe I may say the unqualified success, is relevant.

There is some suggestion that some of the Commissioners seek to take credit for these things. This is not the case. The credit has been distributed in these documents, they were very able men, but a number of these men the Commission selected and, therefore, had things gone very badly, it is possible that someone might have suggested that we were at fault.

Mr. PRICE. Did you have any complaint from the military on lack of cooperation?

Mr. LILIENTHAL. No; on the contrary.

Mr. PRICE. As one of the two members of the committee who witnessed those tests, I might say I was very deeply impressed by the spirit of cooperation between the Army, Navy, Air Force, and Commission during those tests, and I believe my colleague, Mr. Cole, might agree with me in that respect.

Mr. COLE. Yes, indeed.

The CHAIRMAN. Mr. Elston?

Mr. ELSTON. Mr. Lilienthal, whether the person is taken on an emergency basis or on a permanent basis, there eventually is made up a security record on that individual; is there not?

Mr. LILIENTHAL. Yes, sir.

Mr. ELSTON. And who retains that security record?

Mr. LILIENTHAL. The Atomic Energy Commission retains it, and from time to time, upon request, they are supplied to the joint committee for inspection by its members and staff. This has been the practice for a couple of years or more.

Mr. ELSTON. Is the record retained here in Washington or does it accompany the individual?

Mr. LILIENTHAL. The record goes to the field, Mr. Elston, where the individual is employed.

Mr. ELSTON. And the security officer there has complete access to the entire security record of that individual?

Mr. LILIENTHAL. Yes.

Mr. ELSTON. Now, if a person is hired for work that does not give him access to classified material and is later promoted to a position where he does have that access, is his record screened again?

Mr. LILIENTHAL. I shall have to ask Mr. Wilson to answer that.

Mr. WILSON. Yes; it is.

Mr. ELSTON. Your answer is "Yes?"

Mr. WILSON. Yes.

Mr. ELSTON. Who does the screening?

Mr. WILSON. The security officer and the manager at the installation where the individual is employed, if it is outside of Washington. If it is Washington, it is the Director of Security, and the Division Director concerned in Washington.

Mr. ELSTON. And the security officer in the field is directly responsible to the Commission?

Mr. WILSON. To the Commission; yes.

Mr. ELSTON. And he is the Commission's agent?

Mr. WILSON. That is right.

Mr. ELSTON. And the Commission is responsible for his acts?

Mr. WILSON. That is right.

Mr. ELSTON. Now, have you had any cases where persons have been employed, we will say, as a guard, to use a hypothetical case, where he does not have access to classified material, and he is later promoted to a job inside the plant where he does have access to classified material. Is his record screened rather carefully?

Mr. WILSON. Instructions to the managers of operations and to their security officers are that where such transfers occur, the records are to be reexamined. I cannot assure you that this is always done, but these are the instructions.

Mr. ELSTON. Do you know of any cases where it has not been done?

Mr. WILSON. I know of one or two; yes.

Mr. ELSTON. And in those cases were persons who are poor security risks allowed to engage in employment on a job where they had access to classified material?

Mr. WILSON. They were people who had been cleared for access to restricted data in the first place.

Mr. ELSTON. The question is whether or not their record was later screened and derogatory material in their record disclosed.

Mr. WILSON. You mean reevaluated by the people there?

Mr. ELSTON. Yes.

Mr. WILSON. There are cases—there are a few cases, as I say, which I know of where this was not done.

Mr. ELSTON. Can you give us any reason why it was not done?

Mr. WILSON. Failure to follow instructions—I do not know, I cannot explain why it was not done. It was not done. But the people involved were not regarded as security risks, if you will. We have no one whom we regard as security risks using and having access to restricted data.

I should say there are a few instances where individuals' records have been fully examined, where the individual has had long association with the project, in which the evaluation was made in the light of all of the evidence in the FBI records and other information gathered together, and a determination has been made to plant the individual a Q clearance, which is clearance for access to restricted data. This occurs in every case, but in various cases the amount of so-called derogatory information will vary greatly.

Mr. ELSTON. If you had an individual who had access to restricted data and had access to materials such as uranium, you would be very careful about that individual; would you not?

Mr. WILSON. Mr. Elston, people having access to uranium number thousands in this whole enterprise. In the production plants, in the metals plants, in the laboratories it is the essence of their work that they have access to uranium and its compounds.

Mr. ELSTON. Have any of those persons been given emergency clearances?

Mr. WILSON. I am sure there have been cases of the grant of emergency clearance for people working in laboratories who, therefore, have access to working with uranium and its compounds.

Mr. ELSTON. Of course, some persons work with uranium upon whom you would make a more careful check than others; is that not correct?

Mr. WILSON. Well, certainly a reexamination in terms of general responsibility of an individual occurs wherever he transfers from one job to another.

Mr. ELSTON. What about a person who had charge of a safe, the combination to a safe, in which uranium was stored? Would you screen his record more carefully than you would the average record?

Mr. WILSON. It should be.

Mr. ELSTON. And what would be the attitude of the Commission with respect to an individual who had that kind of a position who had a police record?

Mr. WILSON. A police record alone—without the full file, it is impossible to answer that question, Mr. Elston. There are a great many people in this country who have police records of one kind or another. It is impossible without considering the actual data in the case.

Mr. ELSTON. To use a hypothetical case, suppose a person were arrested for grand larceny and there was no prosecution; arrested again, and no prosecution; and on his questionnaire he had answered that he had never been arrested.

Mr. WILSON. The case should be considered as a matter of falsification of a document and, as such, a Federal offense.

Mr. ELSTON. Well, if a person had access to the security record, he could readily tell whether or not there had been that falsification; could he not?

Mr. WILSON. He should; yes.

Mr. ELSTON. Before giving a person a position of great responsibility such as having access to the vault in which highly classified material was stored, say uranium-235, would not you give that particular individual a particular check?

Mr. WILSON. He should be given such a check.

Mr. ELSTON. Have you had any cases like that?

Mr. WILSON. We have had a case in which he was not, and the individual has been transferred to other duty.

Mr. ELSTON. Did anything disappear from the vault while he was in charge?

Mr. WILSON. That I cannot answer.

Mr. ELSTON. You mean you would rather not answer, or you do not know?

Mr. WILSON. I believe, Mr. Elston, you are referring to the situation at the Argonne National Laboratory at Chicago on which we expect to submit a full current report to the joint committee at the executive session this afternoon.

Mr. ELSTON. In other words, you would rather defer your answer until then?

Mr. WILSON. Yes, sir.

Mr. ELSTON. I will respect your wishes in the matter.

Do I understand that you said the particular individual had been transferred or has been discharged?

Mr. WILSON. I am informed that he is no longer in the position which he formerly held in connection with the accountability of material.

Mr. ELSTON. He has been given some other position, then?

Mr. WILSON. That is my understanding.

Mr. ELSTON. Of greater responsibility, or less?

Mr. WILSON. Less.

Mr. ELSTON. More pay or less pay?

Mr. WILSON. I do not know.

Mr. ELSTON. You said a moment ago that if he answered a question incorrectly with respect to whether or not he had been arrested, it would constitute an offense.

Mr. WILSON. If the statement he made in his P. S. Q. was false, it is a case which we should refer to the Department of Justice and we will. I do not have the full facts on this at the present time.

Mr. ELSTON. When did it come to your attention?

Mr. WILSON. Several weeks ago.

Mr. ELSTON. How long does it take you to get the full facts?

Mr. WILSON. It takes a varying length of time.

Mr. ELSTON. Now, to be specific, your security record shows whether or not he has ever been arrested before; does it not?

Mr. WILSON. That is what a security record shows.

Mr. ELSTON. That security record is available to you and has been available to you during these past few weeks?

Mr. WILSON. Yes.

Mr. ELSTON. And you know whether or not the security record shows those previous arrests?

Mr. WILSON. Yes.

Mr. ELSTON. And yet you have retained him in your employ?

Mr. WILSON. He is employed by the Argonne National Laboratory, which is the University of Chicago.

Mr. ELSTON. Yes; but he is working in the Argonne National Laboratory by virtue of the fact that it is a contractor employed by the Atomic Energy Commission.

Mr. WILSON. That is right.

Mr. ELSTON. And you have, certainly, control over those employees?

Mr. WILSON. We can certainly advise the contractor to discharge an employee.

Mr. ELSTON. And have you advised the contractor to discharge this employee?

Mr. WILSON. We have not, yet.

Mr. ELSTON. Although you have his questionnaire, which indicates his answer that he has never been arrested?

Mr. WILSON. We do not have that information. The P. S. Q. asked: "Have you ever been convicted?" This was a form of P. S. Q. then in use: "Have you ever been convicted?" The answer was "No."

Mr. ELSTON. Is it "convicted" or "arrested"?

Mr. WILSON. "Convicted." The answer was "No," and there were no convictions.

We do not yet know whether a Federal offense has been committed.

Mr. ELSTON. You are certain it is "convicted" and not "arrested"?

Mr. WILSON. That is right.

Mr. COLE. If the gentleman would yield, perhaps Mr. Wilson was not present, but at least some representative of the Commission advised the committee that the expression was a denial of having been arrested, and it is based upon that information given to the committee that Mr. Elston is proceeding with his questioning. What the fact is we do not know, of course. I think we should find out.

Mr. ELSTON. Let's be fair about the matter. Let's have the P. S. Q.

Mr. WILSON. We will furnish it.

(The document referred to is classified.)

Mr. DURHAM. He was employed by the Manhattan project, was he not?

Mr. WILSON. Yes.

Mr. ELSTON. Would you consider it good management to retain a person in a position of great responsibility such as one who had custody of a vault in which uranium U-235 was kept if he had ever been arrested before and charged with grand larceny, without inquiring into the circumstances of the case?

Mr. WILSON. I think the Director of the Laboratory, who has gone into this thoroughly, who is responsible at Chicago for the management of the Argonne National Laboratory, has reviewed this, did not know of the general background of this individual or did not have it in mind when he was transferred to this position; he has transferred him to another position.

Mr. ELSTON. Mr. Chairman, that is all for the moment.

The CHAIRMAN. Mr. Jackson?

Mr. WILSON. Pardon me, Mr. Chairman. I do not have the full facts of this before me at the present time. I would like the opportunity of submitting for the record whether it is "arrested" or "convicted." He was a M. E. D. employee.

Mr. PRICE. Can you also furnish the date when his employment began?

Mr. WILSON. I will, sir.

The CHAIRMAN. Mr. Jackson?

Mr. JACKSON. Mr. Lilienthal, there has been some discussion with respect to the granting of emergency clearances to people who might appear on the surface to have a relatively minor job, such as file clerks, librarians, and so on. Is it fair to say that in the granting of emergency clearances you are dealing primarily with a project or a given enterprise rather than the granting of an individual clearance in each specific situation? I wonder if you could clarify that point.

Mr. LILIENTHAL. Representative Jackson, I think the general answer, the answer that covers a typical situation, is that of an emergency involving a project or undertaking, whether large or small, rather than the case of an individual, although, of course, there are such cases.

By and large, the emergency is the emergency covering a project or undertaking, a new piece of work, a need for a certain area of work to be done and done urgently. That is the typical and characteristic case. It is not the only case, but it is the typical and characteristic one.

Mr. JACKSON. It embraces the entire enterprise that must be completed within a stipulated period of time that is the emergency and not just the clerk or the scientist from top to bottom, so to speak, that is involved, necessarily?

Mr. LILIENTHAL. That is the typical and characteristic case and the Bendix and graphite plant cases are of that character, and there are others I did not get into this morning that are quite common, involving the procurement of certain very important materials from manufacturers where failure to secure a particular piece or series of pieces of equipment would hold up the whole success of the weapons or other undertaking.

Mr. JACKSON. One last question, Mr. Chairman.

Mr. Lilienthal, could the Commission have made as many bombs as we now have without the emergency clearance authority?

Mr. LILIENTHAL. No, the Commission could not.

Mr. JACKSON. There is no question about that?

Mr. LILIENTHAL. There is not the slightest question about that, and this may well be elaborated, if there is any remaining question in the committee's mind about the wisdom of the emergency provision, and I believe the added security of the country as a result of its exercise and without underwriting every exercise of judgment—this would be stupid—I think the real answer is in terms of our paramount obligation, using the words of the McMahon Act, our paramount obligation to common defense and security. There has not been an abuse of discretion but rather the exercise of it in the interests of weapons production and other responsibilities of the Commission.

Senator HICKENLOOPER. Mr. Chairman, unless there are some other members who have not asked a question—

The CHAIRMAN. Mr. Hinshaw has not yet.

Senator HICKENLOOPER. I would like to say, if I might, that this last statement of Mr. Lilienthal to the effect that we could not have made as many bombs as we have without the emergency clearance matter is, of course, not a matter to be discussed publicly, it contains classified information, but I completely disagree with that statement, and I cannot let the record stand as agreeing in any way with that statement, and I think it is a matter which the committee can discuss at a later date.

Mr. LILIENTHAL. Mr. Chairman, we can put the soundness of the answer on one case alone; although this is not the only case, the Bendix case will establish this to your satisfaction.

The CHAIRMAN. Now, Mr. Hinshaw?

Mr. HINSHAW. No questions, Mr. Chairman.

The CHAIRMAN. I believe every member has had an opportunity, but Senator Hickenlooper says he has two more questions.

Senator HICKENLOOPER. I would like to again read the exception in the law referring to emergency clearances. It is as follows:

Except as authorized by the Commission in case of emergency—

I am only quoting part of the law. But I would like to ask Mr. Lilienthal if the Commission has determined these various emergencies in a formal way.

Has the Commission determined from time to time that an emergency does exist, and, therefore, justified the emergency hiring?

Mr. LILIENTHAL. The Commission has determined the policy, the standards, the criteria, and has determined where that discretion shall be lodged on its behalf. It has not passed on the individual cases.

Senator HICKENLOOPER. Has the Commission by any formal action recorded its determination that there is a case of emergency, in any case?

Mr. LILIENTHAL. That misconceives the management problem.

Senator HICKENLOOPER. I am referring specifically to the terms of the law, reading—

Except as authorized by the Commission in case of emergency \* \* \*.

Now, my question is, has the Commission at any time determined that there is an emergency and, therefore, that emergency clearances must be granted?

Mr. LILIENTHAL. The Commission has not construed this provision of the act or any of the numerous provisions of the act in which it is said "The Commission shall do this" or "The Commission shall do that," the answer is it has not exercised its authority under this act in the manner suggested, nor has it done so in most of the other instances in which the term "Commission" is used.

Senator HICKENLOOPER. May I ask the question again, if you please—if you care to answer it:

Has the Commission ever authorized or declared that there is a case of emergency upon which to base emergency clearances?

Mr. LILIENTHAL. I take it, if I understand the question, this is a technical question.

Senator HICKENLOOPER. Not at all; not at all. It is in the direct language of the provision of the act.

Mr. LILIENTHAL. I mean the technical meaning of the act. Does the Commission in each instance—to see if I understand your question: In each instance of emergency clearance, does the Commission, as a body—these five hapless individuals—sit down at a Commission meeting and formally declare or find that an emergency exists justifying the clearance? And the answer is "No."

Senator HICKENLOOPER. It never has?

Mr. LILIENTHAL. It does not operate that way.

Senator HICKENLOOPER. I did not ask you as to the method of operation, and I am not arguing the philosophy or eventual interpretation of the law; I am interested in your interpretation of your authority, but I am merely asking the question as to whether or not the Commission has ever, during its operation, found that there is a case or cases of emergency and has, thereupon, authorized emergency clearance; and I take it the answer is "No."

Mr. LILIENTHAL. No; the answer is—there have been such cases, I do not recall all of them. The Hanford case was one. But, to continue the answer, that has not been the manner in which we have typically administered this provision. There have been such cases.

Senator HICKENLOOPER. I understand, but I am concerned, overall, with what the solemn provisions of the law passed by the Congress of the United States to govern your actions, and that of the Commission, may be; so that I am merely trying to find whether or not the Commission has ever found an emergency to exist and thereafter authorized the hiring of people on emergency clearance.

Mr. LILIENTHAL. The answer is: It has, and the only case that occurs to me, Senator, offhand, is the Hanford case. There may be others; but I would like to reaffirm, because I do not want any ambiguity about it, our action as a Commission has been to delegate this au-

thority, subject to standards and criteria, and we believe this is good management practice.

Senator HICKENLOOPER. Of course, again I say I am interested in your interpretation of your authority, but I am also interested in what the law of the land provides, and if you have taken such formal action by the Commission, I assume it would appear in the minutes of the Commission which, of course, I have not yet been granted access to, and if it does so appear, I shall appreciate it if you can submit to the committee the page and the date so that we may examine the proceedings and see just exactly what the action of the Commission was.

Now, Mr. Chairman, I would like to ask just one more question, and then I am through.

I would like to ask Mr. Lilienthal, if you know how many Communists or members of subversive organizations are now working for the Commission or the contractors in the scientific and technical work of the Commission. I am just asking if you know.

Mr. LILIENTHAL. Of my own knowledge, of course, I do not but I do know that we have procedures, investigations, and responsible men whose duty it is, under standards and criteria fixed by the Commission and which are a part of the last report to the Congress, to prevent that sort of thing happening, and I believe, and I agree with you, that the record, as stated in your testimony in the Smyth hearings, is an unusually good one.

Senator HICKENLOOPER. Yes. I may suggest, Mr. Chairman, that, of course, it is manifestly impossible for either the Commission or its management, apparently, to have any idea of this that would be final, because up to, and through, March of 1949 there were 359 people with access to restricted data about whom no investigation had been completed, and if that is carried out on the average for the months of April and May, it probably would be somewhere over 400 people about whom no final judgment can be passed because no investigation has been completed.

Now, Mr. Chairman, I think that is all I have. I believe this matter of emergency clearance is a serious thing. I again state that I believe it is in contravention with not only the letter but the spirit of the Atomic Energy Act, and think it is a situation that the committee can well be concerned about and that the public could well be concerned about.

The CHAIRMAN. Now, Mr. Lilienthal, in pursuance of my reassurance to you that you would be allowed to put into the record at this time your analysis of the personnel turn-over we talked about yesterday, you may now proceed.

Mr. LILIENTHAL. I shall be very brief.

Senator Hickenlooper yesterday said that there were 4,366 employees of the Commission who left the Commission's service during the 2-year period, 1947-48, for all causes, and these figures were taken, he stated, from the monthly reports provided to the joint committee for a good many months on employment matters.

He said that 4,366 is 87 percent of the highest month's employment during that period, which was 5,010. Senator Hickenlooper's arithmetic is correct, but the statement is incorrect.

The correct figures should be 50.7 percent for that period, and this I can explain very briefly. Two thousand three hundred and nineteen

people left in the 2-year period, which is roughly 50 percent, for reasons attributable to voluntary termination of services.

Senator HICKENLOOPER included in the figure 4,366, which arithmetically is 87 percent of 5,010, people who left the service for other reasons than their own volition. There were included in his figure of 4,366 those who were fired for cause. There were those who left the Commission service by reason of a reduction in force at a particular location. And then there were people who left because they died or they retired under compulsory retirement or because they had babies. Now, this is called maternity leave, I believe, and is denominated here as l. w. o. p.

In regard to those who left because they had babies, this may be an evidence of incredible mismanagement, but not on the part of the Commission. [Laughter.]

Senator HICKENLOOPER. It would be interesting to note how many did have babies.

Mr. ELSTON. I would like to ask another question.

The CHAIRMAN. Just a minute, Mr. Elston, if you please.

Mr. LILIENTHAL, will you please give us a break-down of those that were discharged. Can you read that?

Mr. LILIENTHAL. Yes, sir.

The CHAIRMAN. Discharged for cause.

Mr. LILIENTHAL. I have here a summary of Atomic Energy Commission Federal personnel separations. This is wonderful jargon—"separations." Someone has been "selected for separation." It sounds like an honor.

These separations are under the following categories:

"Voluntary separation," "reduction in force," "removal for cause," "extended l.w.o.p." Those are the babies for a large part. To continue: "Other reasons," which includes death, retirement, and so on.

The figures also include the full-time strength at the end of the month in question, and these are set up in terms of months from January 1947 through December 1948. The total for that period, as appears here, is 4,920. I do not know whether you want me to read month by month.

The CHAIRMAN. Just give the total.

Mr. LILIENTHAL. The total in 1947, total separations, that is 2,581, which includes the footnote, "Indicates 893 persons transferred to contractors for Atomic Energy Commission," so they are still part of the enterprise.

Voluntary separations total for 1947 was 1,332.

Reduction in force for the period, the total was 761 for 1947.

Removal for cause—where I came from this means being fired—43.

Senator HICKENLOOPER. There is quite a connotation about reduction in force meaning fired. Is not that a convenient way used often in place—I do not say you used it—but reduction in force is used very often to get rid of people when not wanted.

Mr. LILIENTHAL. Ordinarily that term is used in personnel management to indicate that the work for which they are employed, the load of that work has diminished.

Senator HICKENLOOPER. I was speaking in view of the fact that more people were hired than were reduced, so that the force was not in fact reduced.

Mr. LILIENTHAL. Sometimes reduction in force is accounted for by an act of God such as reduction in appropriation for that purpose.

Then there is extended leave without pay, the total being 82.

Other reasons, which include death, retirement, and so on, total 363.

Then for 1948 the total of separations is 1,812, which the footnote indicates includes 154 persons transferred to Atomic Energy Commission contractors. This is an important footnote, of course.

Voluntary separations, 987; reduction in force, 319; removal for cause, 8; extended l.w.o.p., 43; other reasons, 455.

There are some other figures of some interest here as to separation rate as compared to the Federal Government separation rate and manufacturing industry separation rate. This can be put into the record or it can be read.

The CHAIRMAN. What is it compared to the Federal Government?

Mr. LILIENTHAL. For the year 1947 the separation rate in the Government as a whole is 61 percent. No; I am sorry. The Atomic Energy Commission rate is 61 percent, and in 1948 the separation rate is 36.9 to be compared with the Federal Government separation rate in 1947 of 49.7 and for the year 1948 of 33.3 percent.

Senator MILLIKIN. Could we have them year by year again? I think we are mixed up. Take them across year by year.

Mr. LILIENTHAL. On the separation rates, for 1947 the separation rate for the Atomic Energy Commission for all reasons is 61 percent. The Federal Government separation rate for all reasons, 49.7. Manufacturing industry separation rate for all reasons, 58.1 percent.

Senator HICKENLOOPER. That includes companies that go out of business and, of course, the employees are out of work, I believe.

Mr. LILIENTHAL. For all reasons. And for 1948 the figures, Senator Millikin, are: Separation rate for the Atomic Energy Commission for all reasons, 36.9 percent; Federal Government separation rate, 33.3 percent; and for manufacturing industries separation rate, all reasons, 54.8 percent.

I would like to put the full summary into the record.

The CHAIRMAN. Submit it for the record, will you?

(The document referred to is marked exhibit 1 and will be found in the appendix.)

The CHAIRMAN. Mr. Elston, I believe you had a question.

Mr. ELSTON. Yes, Mr. Chairman.

Mr. Wilson, I have obtained a personal security questionnaire, not of the individual to whom you referred, but I assume the form is the same with respect to all of them, and I would like to have you look at this questionnaire and see if that is the form.

Mr. WILSON. This is certainly a form that has been used. I cannot tell you without the date whether it is the latest form or whether it is the form that was used in the case you describe.

Mr. ELSTON. Will you read what appears on the printed part of the questionnaire that appears after Question No. 19?

Mr. WILSON. Yes. It says:

Arrests. Include all arrests and fines other than minor traffic violations.

Mr. ELSTON. Read further on.

Mr. WILSON. (reading) :

I certify that the information contained above is correct and complete to the best of my knowledge and belief. I understand that the Government of the United States will investigate the information contained herein and that any false statement is sufficient cause for rejection of the application or dismissal after appointment.

Mr. ELSTON. I do not believe you read all of Question 19.

Mr. WILSON. Question 19 :

Arrests. Include all arrests and fines other than minor traffic violations, charge, date, place where arrested, disposition.

Mr. ELSTON. Yes. You do not recall any questionnaire ever being changed from "arrests" to "convictions," do you?

Mr. WILSON. I do not.

Mr. ELSTON. Just another question to clarify the record.

The P. S. Q., Personal Security Questionnaire, is a part of an individual security record?

Mr. WILSON. That is correct.

Mr. ELSTON. And the report of the FBI or any other report affecting his character and record is also a part of that record?

Mr. WILSON. Well, certainly, the security file is a very complete record. It may not have all employment data, which are contained in the personnel records of the employee.

Mr. ELSTON. But it would have a record of his arrests?

Mr. WILSON. It would.

Mr. ELSTON. And it would have his questionnaire signed by himself indicating whether he had or had not been arrested?

Mr. WILSON. Right.

Mr. ELSTON. So that all you would have to do is look at the security file to tell whether or not he had told the truth about it?

Mr. WILSON. That is correct.

Mr. ELSTON. And, notwithstanding the fact that is all you have to do and all you had to do in this particular case, the individual to whom you refer was transferred from his job where he had charge of the vault in which U-235 was contained to another job?

Mr. WILSON. I am informed that he is still employed by the Argonne National Laboratory.

Mr. ELSTON. Has the Commission done anything about removing him?

Mr. WILSON. The Laboratory Director, at our suggestion, removed him from one position to another. The actual disposition of the case, whether action will be brought by the Department of Justice, we are not informed about yet. Certainly, the FBI in Chicago have been told about this case.

Mr. ELSTON. Do you consider it the part of good management to keep in any position a person who lied in his questionnaire about his having been arrested before?

Mr. WILSON. I do not think anyone who lies in his questionnaire should be continued in employment.

Mr. ELSTON. Was this individual continued?

Mr. WILSON. He has been up to the present time.

Mr. ELSTON. Do you know what his record shows about his having been arrested before?

Mr. WILSON. I have looked at the record in the past, several weeks ago.

Mr. ELSTON. What does it show?

Mr. WILSON. It shows that he was arrested on several occasions.

Mr. ELSTON. And one of the charges was grand larceny?

Mr. WILSON. Yes; none were pressed, all cases were dismissed, but the fact is that he was arrested.

Mr. ELSTON. And the fact also is that in his questionnaire he denied that he had ever been arrested?

Mr. WILSON. That is right; he did not so state.

Mr. ELSTON. When did you first find out that he had not correctly stated the situation in his questionnaire?

Mr. WILSON. Several weeks ago.

Mr. ELSTON. And notwithstanding the fact that you noticed that discrepancy, you have retained him in the employment at the Argonne Laboratory?

Mr. WILSON. I think it is correct to state, Mr. Elston, that at the time this first came to my attention the incident at the Argonne National Laboratory was under investigation by the FBI. I would have to check and see, but it is my impression that during the period of that investigation it is our general practice, and generally their suggestion, that moves which will inhibit their completing an investigation are not made.

Mr. ELSTON. Has the investigation been completed?

Mr. WILSON. I do not believe it has, because a further report was received at our office only this morning on this whole matter.

Mr. ELSTON. Well, the investigation is not——

Mr. WILSON. It is considered pending.

Mr. ELSTON. The investigation is not with respect to whether or not he was arrested before.

Mr. WILSON. That is correct.

Mr. ELSTON. The investigation is with respect to the loss of uranium.

Mr. WILSON. That is right, but the investigation of the loss of uranium involves any of the individuals who may have had access to this vault.

Mr. ELSTON. But the fact that in his questionnaire he denied he had ever been arrested and the record beyond question of a doubt shows he has been arrested has nothing to do with the FBI investigation, has it?

Mr. WILSON. It has in this sense, Mr. Elston: When the FBI undertakes to investigate a reported loss, they have to investigate all of the factors that were involved, to interview the people, and in general they prefer that the situation be kept so that the people involved are readily available for interviewing, and that they can gather all of the information possible before administrative action is taken to discharge people and have them no longer available for interview.

Mr. ELSTON. You do not know whether the investigation is complete or not, do you?

Mr. WILSON. I believe it is still pending.

Mr. ELSTON. That is all.

Senator HICKENLOOPER. Mr. Chairman, I would like to call attention to the fact that in regard to the request for certain things which I made yesterday, records and other things, the committee met yesterday afternoon and made certain authorizations. The Commission has not yet delivered those matters, formally authorized by the committee,

to me. This will be a tremendous handicap if I do not get them immediately. I hope that the chairman can admonish the Commission to please expedite the delivery of those matters authorized.

The CHAIRMAN. Let's ask Mr. Volpe. I talked with you and gave you the list of things that the committee had authorized, and you assured me they would be produced as expeditiously as possible. Could you report on that now?

Mr. VOLPE. We started yesterday gathering all the material Senator Hickenlooper listed during yesterday's hearing. Thereafter, we were advised by you that the committee had met and the committee was sending us a letter of instructions as to what was to be transmitted and where. We have received that and people are at work gathering the material the committee has requested. I would assume some of it has probably already been delivered to the joint committee's office. If that is not the case, I will check it just as soon as I get back.

The CHAIRMAN. I hope that you will comply with the request just as quickly as you possibly can, as I told you last night, and as I indicated in my letter.

Mr. COLE. Mr. Chairman.

The CHAIRMAN. Mr. Cole?

Mr. COLE. Yesterday morning and this morning I observed a number of members of the Commission and employees of the Commission and associates of the Commission attending the hearings. I have no quarrel with that, but for myself I should like to know who they are and how many there are and I would respectfully ask, if it is not out of order, that those individuals present who come within that classification of employment or association with the Commission should stand so that we can see who they are. May we have them stand long enough to see how many there are? Twenty-nine, as I count them.

Mr. LILIENTHAL. Mr. Cole, may I make this suggestion in the spirit of assisting the Commission's business? If we could be advised, say of an afternoon, of the subject matter that is to be presented the following morning, then only those individuals who are concerned with that subject need be here, but as long as we do not know until the hearings open even what the area is, it puts us at a great disadvantage not to have the people here to provide the information.

Mr. COLE. I wanted to indicate I have no criticism of the practice. I wanted to know to what extent these hearings were interfering with the Commission's work. It may be necessary to have them here; I do not say it is not. I would like to have the identity of these individuals who are here and what their capacity in the Commission is.

The CHAIRMAN. Do you wish them to stand and announce it, or do you wish a memorandum to be given us for the record?

Mr. COLE. That is all right.

The CHAIRMAN. You have heard Mr. Cole's request and I think it is a fair one and, therefore, will you see that it is complied with, Mr. Lilienthal?

(United States Atomic Energy Commission personnel attending hearing of Joint Committee on Atomic Energy, June 2, 1949 (a. m.) :)

David E. Lilienthal, Chairman; Gordon Dean, Commissioner; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Joseph Volpe, Jr., General Counsel; Everett Hollis, Office of General Counsel; Walter J. Williams, Director of Production; Brig. Gen. James McCormack, Jr., Direc-

tor of Military Application; Lawrence R. Hafstad, Director of Reactor Development; Jesse C. Johnson, Acting Director of Raw Materials; Paul M. Green, Controller; Fletcher C. Waller, Director of Organization and Personnel; Morse Salisbury, Director of Public and Technical Information Service; Francis Hammack, Acting Director of Security; Roy B. Snapp, Secretary to the Commission; William C. Trueheart, Office of the Secretary; Frances A. Henderson, Special Assistant to the Chairman; Capt. James S. Russell, Division of Military Application; Col. William K. Skaer, Division of Military Application; Bruce Uthus, Division of Security; Robert A. Haynie, Division of Security; Rodney Southwick, Public and Technical Information Service; Edward J. Brosnan, Jr., courier; Ernest L. Ferullo, courier; John H. Kane, courier; Michaelangelo DeMatteis, courier; and Adrian Fisher, former General Counsel.

Mr. LILIENTHAL. Yes, I will; and it was a very constructive point. It was not Mr. Cole's intention to criticize their presence, but I am raising the question about whether there might be some way by which the top staff could be used to better advantage in some manner connected with the hearings. This is completely beyond our prerogative, of course, but it would assist the Commission in the next month if some such arrangement could be made.

The CHAIRMAN. I notice the Director of the Division of Reactor Development was here. What you have in mind is if you could be advised today that security matters will be gone into tomorrow, that it would not be necessary for him to be present; is that right?

Mr. LILIENTHAL. That states the proposition; yes.

The CHAIRMAN. Of course, I see no way to avoid the presence of the Commissioners here during all of the hearings because it is the Commission as well as yourself that is the subject of this investigation. I might say, Mr. Volpe, I have been informed that to date there has been no delivery to the committee's office, so please check after the meeting and advise us. We will appreciate it.

The committee has a matter which we must take up in executive session, which we will do at 2:30 in 48-G. An announcement at the end of that meeting as to whether or not there will be an open session of the committee tomorrow will be made.

Mr. COLE. Mr. Chairman, in connection with the suggestion made by Mr. Lilienthal, it does seem to me an extravagance to have this substantial number of people sitting around here day after day when maybe they will not be used at all, and it seems to me it is not unreasonable for the committee to expect Senator Hickenlooper to indicate to the Commission perhaps an hour in advance of the hearings the general substance which he intends to cover. I doubt if it is fair to ask him to indicate that the night before because he probably does not know until the next morning just what it is going to be, because he has to, I suspect, work in the evening to develop his case.

If it is not unreasonable, I should suggest that Senator Hickenlooper indicate to the Commission the general area of the subject of his investigation at least an hour before the committee starts its hearings so that a good many of these folks can stay on down below there and carry on the work.

Senator HICKENLOOPER. I am perfectly willing to cooperate, but I again point out, as I did yesterday, the difficulty of trying to prepare a presentation and getting the supporting data only a short time before the meeting. It will take some time, a day or two's work, before I shall be ready to present a matter, but I shall cooperate as best I can, and I think we can talk that over.

Mr. COLE. For instance, this morning it would have been a simple matter if the Commission could have been informed that the subject today was to be emergency clearance.

Mr. LILIENTHAL. That is right.

Mr. COLE. That would have relieved a good many of these folks, I should think.

The CHAIRMAN. We may be able to work this out in some detail this afternoon and in the meantime this meeting is recessed.

(Whereupon, at 12:30 p. m., the joint committee adjourned, subject to the call of the Chair.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

MONDAY, JUNE 6, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to notice, at 10 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon, Connally, Vandenberg, Millikin, Knowland, Hickenlooper; Representatives Holifield, Price, Jackson, Cole, Elston, and Van Zandt.

Also present: Senator Edward J. Thye.

David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Joseph Volpe, Jr., General Counsel; Capt. James S. Russell, Col. W. L. Bell, Lt. Col. K. E. Fields, L. H. Bayer, of the Division of Military Application; Everett Hollis, Bennett Boskey, of the Office of General Counsel; Fletcher C. Waller, Director, Division of Organization and Personnel; R. A. Waney, of Information Security; Emmon Brown, of Physical Security; C. A. Rolander, of Violations; Morse Salisbury, Director, Division of Public and Technical Information; and Francis Ham-mack, Acting Director of Security; all of the Atomic Energy Commission.

The CHAIRMAN. The meeting will come to order. Are the Members of the Commission present?

Would the other Commissioners care to take more advantageous seats? Would you care to sit up here, Commissioners?

The committee is ready to proceed. Senator Hickenlooper, I believe, has another matter which he wishes to explore this morning.

Will you proceed, Senator Hickenlooper?

**STATEMENT OF DAVID E. LILIENTHAL, CHAIRMAN, ATOMIC ENERGY COMMISSION; ACCOMPANIED BY CARROLL L. WILSON, GENERAL MANAGER, AND JOSEPH VOLPE, JR., GENERAL COUNSEL, ATOMIC ENERGY COMMISSION**

Senator HICKENLOOPER. First, may I call your attention and the attention of the committee to the fact that item No. 10, which I requested last Wednesday morning, which is as follows:

All reports, including correspondence with the FBI relative to lost or misplaced fissionable or source material, whether recovered or still

missing, has never been received by me, and 5 days have gone by and it is, I believe, important that I receive it, and it is important that I should have received it long before this in order to expedite this matter.

The CHAIRMAN. What is the explanation, Mr. Lilienthal, for the fact that this has not been received?

Mr. LILIENTHAL. The material will be ready, it is expected, sometime during the day. Part of this material had to come from the field.

The CHAIRMAN. You do think you will be able to get it into our hands this morning or during the day?

Mr. LILIENTHAL. During the day, I am advised; yes.

The CHAIRMAN. All right.

Senator HICKENLOOPER. Mr. Chairman, in order to examine this case I am going to raise some issues of philosophy this morning; I would like to ask Mr. Lilienthal some questions, five or six, in order to explore this matter at the outset.

I would like to ask Mr. Lilienthal: Do you believe that there is a Communist conspiracy to overthrow the Government of the United States by force and violence?

Mr. LILIENTHAL. Yes, I do.

Senator HICKENLOOPER. Do you consider communism a cynical and ruthless power which by guile, misrepresentation, infiltration and violation of all the standards that the American people hold dear seeks to overthrow our Government?

Mr. LILIENTHAL. I do; indeed. The words sound familiar.

Senator HICKENLOOPER. They are your own words, Mr. Lilienthal. I merely wanted the answer for this record.

Mr. LILIENTHAL. Yes, sir.

Senator HICKENLOOPER. This question is a rather peculiar question, but I shall give you the reason for it in just a moment.

Do you consider yourself a liberal groping to discover if United States Communists really take direct and unquestioned orders from Moscow?

Mr. LILIENTHAL. I would like to break this up into two parts. I do consider myself a liberal, an old-fashioned liberal. I certainly am groping, as I think most people with any humility are, but I am not groping on this particular subject.

Senator HICKENLOOPER. It is only fair that I give you the reason why I asked that particular question. Senator Graham of North Carolina, whom you know and we all know, is reported in the Daily Independent of Kannapolis, N. C., Sunday morning, May 29, 1949, as having made a speech at Chapel Hill on May 28. This is an International News story.

I do not want to involve Dr. Graham as an individual in this matter, but I am merely using the statements made here in exploring this question. I read the first part of the International News story:

CHAPEL HILL, May 28, INS.—Senator Frank P. Graham (D., N. C.)—

Democrat, North Carolina, I presume—

declared today that it has not been proven that American Communists are disloyal to the United States. The former North Carolina University President explained that so-called liberal thinkers in this Nation are not convinced that a Communist is necessarily un-American.

I shall skip some personal references he made there; I shall show you the entire article in a moment. I continue quoting from the news story:

He said the Nation's "liberal" element is "groping" to discover if United States Communists really take direct and unquestioned orders from Moscow.

I continue reading the next paragraph:

As one of the gropers Graham named Atomic Energy Commission Chairman David Lilienthal.

I am assuming nothing from that except that is the basis for my question, and you are perfectly at liberty to see the entire article. It is short, if you would like to see it. That is the basis for that question.

Mr. LILIENTHAL. I think I should add that the question of characteristics of the Communist Party of the United States in this respect is the subject of a judicial proceeding in the Federal District for New York, and I do not, by my answer, intend to prejudge the result of that trial, that not being my custom as a lawyer, but I was asked my personal opinion, and my personal opinion is as indicated.

Senator HICKENLOOPER. Another question: Do you consider yourself an expert in the sense that the FBI is expert on the devious ways and tactics by which the Communists seeks to achieve their purpose here?

Mr. LILIENTHAL. Expert on this subject?

Senator HICKENLOOPER. Yes.

Mr. LILIENTHAL. No, I am not.

Senator HICKENLOOPER. Mr. Lilienthal, do you believe that the Atomic Energy Commission and its activities is a primary target for Communist espionage?

Mr. LILIENTHAL. I certainly do.

Senator HICKENLOOPER. Mr. Lilienthal, in case of doubt as to an individual being considered for clearance for access to restricted data in atomic energy work, do you believe that such doubt should be resolved in favor of the Government and against the individual?

Mr. LILIENTHAL. I think the doubt should be resolved in favor of the security of the country. In some instances this would fall one way and in some another, and in the hearings with the joint committee on individual cases we have gone into the fact that there are cases where, by keeping an individual on about whom there is some doubt, we may actually be furthering the security of the country.

Senator HICKENLOOPER. Then I take it that if there has been a case or cases where doubt exists as to the security risk of the individual and yet he has been kept on, is that in cases where the individual is considered to be uniquely necessary to the program?

Mr. LILIENTHAL. That would be one instance in which I believe, with the general approval of the joint committee, certainly with the Roberts Board, cases were decided.

But there would be a variety of such cases. I think, to answer this question in any rather narrow compass, Senator Hickenlooper, would not be fully responsive.

Senator HICKENLOOPER. Do I take it that you approve the policy in certain cases of clearing people for access to restricted data where there actually exists a doubt as to the security risk involved?

Mr. LILIENTHAL. There are a number of instances, as the Senator is aware and has been aware for a matter of almost two years, and as the members of the joint committee, are aware in which individuals who have had a long record of experience in this project, having been cleared by the Manhattan Engineering District to the very top secrets of this enterprise prior to the Commission's organization, had in their record, allegations or questions, on which, had these individuals been applicants for admission to the project in the first place, we would probably not have taken the same action as the Manhattan Engineering District did, which was to take a calculated risk and admit them.

One of the reasons for that is that they are people who have demonstrated great scientific capacity, have demonstrated by their work that they are presumably trustworthy, and, in any case, are now the possessors of crucial information. And in such cases—and there are such cases—the wise thing to do seems to be, with surrounding precautions of which the committee is aware, to continue their clearance, and this has been done.

Therefore, I am unable to answer the categorical question.

Senator HICKENLOOPER. Then may I ask you this: In case where doubt exists and the individual is not essential to the project and he applies for clearance or is considered for clearance to restricted data, do you believe the doubt should be resolved in favor of the Government?

Mr. LILIENTHAL. In many cases clearance has been denied in such instances. It would help me, Senator, if you could elaborate a little on what you mean by "doubt."

Senator HICKENLOOPER. What I mean is where doubt has been raised as to the reliability of the individual as a risk to preserve the secret information with which he may come in contact.

Now, that includes, of course, character, loyalty, and associations.

It encompasses three categories, not confined to loyalty alone, and may not even include loyalty, but where doubt is raised as to his being a good security risk and where he is considered not to be an essential individual.

Mr. LILIENTHAL. The difficulty here in answering categorically is that things do not come quite as simply as that, because it matters a lot what kind of doubt is raised, who raises it, the character of the doubt.

For example, what the Commission has tried to do is to develop something like a standard or criterion because what we are going through now in our efforts to preserve security in this country, and still have freedom and liberty, presents new issues to the American people.

Senator HICKENLOOPER. May I use the word "substantial doubt," then, in order to get away from a strained, imagined doubt, what we all understand as a really substantial doubt about the security risk involved.

Mr. LILIENTHAL. There again is the difficulty; as in all cases of this kind, people have a different standard of what is a substantial doubt. In the case of a person charged, where it is fairly clear that he is a member of the Communist Party, this is on one end of the spectrum. At the other end are vague kinds of standards such as the one the Senator suggested in the hearings, I believe, on the fellowship pro-

gram or on the confirmation of our two new colleagues, in which he used as a standard those people who have potentially subversive or otherwise undesirable views. Now, in between these two there is a wide range of what constitutes doubt.

What the Commission has tried to do, instead of answering categorically, as would be easier, is to try to set up a series of criteria. These criteria took quite a long time. This is a pretty important matter. We are talking about individual liberty, and this happens still to be a very important subject in this country. These criteria developed two categories, and I might say these are two categories of doubt, to use your expression.

Senator HICKENLOOPER. I will put the criteria in the record in a few minutes.

To put it another way: Do you believe on the question of clearance of an individual for access to restricted data that he should be above all reasonable suspicion as a security risk? That is a general philosophy of approach.

Mr. LILIENTHAL. Yes. I want to say that the Commission and its advisers spent a great deal of time, took a great deal of time, conservatively, in trying to develop criteria. Those criteria we have written down. I would like to stick to those criteria and not invent new ones in the process of extemporaneous answers here, because this is too important and serious a matter.

Senator HICKENLOOPER. As I said, I will put the criteria in the record in a few minutes.

I would like to ask Mr. Wilson, the General Manager, if you care to state: Do you find yourself in general agreement with the position taken by Mr. Lilienthal?

Mr. WILSON. I do, Senator.

Senator HICKENLOOPER. At this point in the record I would like to put in a few short excerpts from the testimony before the Subcommittee of the Committee on Appropriations of the independent offices, on the appropriation bill, in the Senate May 19, 1949. Some of the language I have already taken out of these and posed in some of my questions.

The CHAIRMAN. So that we will not have any doubt about it, do you need this material or can I give it to the stenographer now?

Senator HICKENLOOPER. I would like to read from it.

The CHAIRMAN. I thought you meant you would put it in the record.

Senator HICKENLOOPER. I want to read from it. This is a discussion of questions and answers between Senator Ferguson and Chairman Lilienthal. Senator Ferguson says:

Now, when did you personally first become of the opinion that the Communists have an international conspiracy to overthrow our Government by force and violence? When did you come to have that opinion?

Commissioner LILIENTHAL. Well, this is sort of a thing where one can't perhaps draw an exact line, but I would think that—

Senator FERGUSON. You are clearly of that opinion this morning, and when did you become of that opinion?

Commissioner LILIENTHAL. If I had any doubts I am sure that they were removed at the time of Czechoslovakia.

Senator FERGUSON. At the time of Czechoslovakia.

Commissioner LILIENTHAL. But certainly I had grave doubts before that time.

Senator FERGUSON. You had grave doubts but that was the cinching thing that convinced you of the real nature of communism?

Commissioner LILIENTHAL. Oh, no. The real nature of communism has been clear to me since my student days, but I am speaking about the nature of communism as—

Senator FERGUSON. As a revolutionary power?

Commissioner LILIENTHAL. It is even worse than that. As a cynical and ruthless power by guile, misrepresentation, infiltration, and violation of all of the standards that the American people hold dear in their way of life. Now, that is quite a different thing.

Senator FERGUSON. Yes, but when did you become of this opinion that it was a revolutionary party, that it was bent on the overthrow of the capitalistic governments by way of force and violence? That is what you and I finally agreed on here this morning, that you do finally believe in that. And now when did you become of that opinion?

Commissioner LILIENTHAL. So far as the Soviet Government is concerned, the Russian Communists, this would go back quite a long way, I should suppose to 1918. But I thought the question was about their designs on the United States.

Senator FERGUSON. You said this present trial tells you certain facts, that you and I arrived at the conclusion that you believe it is a revolutionary party, and that it is bent on overthrowing our Government by force and violence. And now when did you become of that opinion?

Commissioner LILIENTHAL. I cannot recall that precisely, but it certainly has been plain for 20 years that this is the case.

Senator FERGUSON. So all of the time that this contract was going on you knew what Communists were bent on, and therefore there was not anything in your thought that would not bring up the question of communism and the Board, the National Scientific Board, that we had a certain policy in Congress, that the American Government had a certain policy, and that therefore that policy should be in effect written into the contract under the security clause in the contract. That is correct; is it not?

I want to put that in the record and, of course, Mr. Lilienthal may put anything else he wants in the record.

The CHAIRMAN. It is so ordered.

Senator HICKENLOOPER. Now, Mr. Chairman, a very interesting development may occur this week. Since May 22 I have been severely criticized in some quarters, and before all of the evidence has been heard, for speaking out against Mr. Lilienthal. After today, I expect some of these critics to reverse their field with criticism because I did not speak out sooner. This latter criticism may be on firmer ground than the former.

The field I will continue exploring is personnel security and the way clearances for access to restricted data have been handled. I shall begin the examination of certain individual cases. I have no desire to inject the names of these individuals into this record. The specific information contained in the files is confidential. I shall use case symbols such as case A, B, et cetera.

To any suggestion that I may have "sat" on these cases, I want to point out that as early as July 1947 and shortly after the joint committee and its staff began to look into these matters, the joint committee held a meeting with the Commission and certain of its representatives at which time the matter of the seriousness of a vigorous administration of personnel security was discussed at length. Certain cases were mentioned and the joint committee was informed that these cases and any other similar cases would be vigorously pursued and that speedy determinations would be made in the public interest.

This field, among others, became one of continued interest to the joint committee and was the subject of continuing review. On the day after Thanksgiving in 1947, during that traditional holiday period when most people are inclined to be restful, this matter was considered

of such importance that an executive meeting of the joint committee was held lasting all day. The meeting was attended by 10 members of the joint committee; all of the Commissioners, with the exception of Chairman Lilienthal, who had an engagement out of town of some long standing; the General Manager of the Commission and his assistant; the Associate General Counsel and the Director of Security and three of his assistants. At that meeting it was again pointed out by the joint committee that a substantial number of cases involving serious doubt and substantial derogatory information, some of which had been referred to in the July meeting, were still pending and undetermined.

Thereafter and during 1948, through inquiries directed to the Commission in joint committee meetings, through correspondence, and through personal activities of staff members, this subject was constantly pursued.

It was my hope—and I feel certain it was the hope of the joint committee—that this matter of safe and reliable security clearance could be resolved without publicity.

The matter has not been satisfactorily resolved. In fact, in the latter part of 1948 responsibility for security clearances which had theretofore been lodged in the Washington office was, under the device of "delegation of authority," largely decentralized into the field offices. A so-called interim criteria for guidance in personnel clearance was issued and thereafter, on January 5, 1949, the Commission promulgated, in the Federal Register, Criteria for Determination of Eligibility by Security Clearance. I ask that a copy of that criteria as contained in appendix 8, page 188, of the Fifth Semiannual Report of the Atomic Energy Commission, issued in January 1949, be placed in the record at this point.

The CHAIRMAN. It is so ordered.

(The document referred to is as follows:)

#### CRITERIA FOR DETERMINING ELIGIBILITY FOR PERSONNEL SECURITY CLEARANCE

The United States Atomic Energy Commission has adopted basic criteria for the guidance of the responsible officers of the Commission in determining eligibility for personnel security clearance. These criteria are subject to continuing review and may be revised from time to time in order to insure the most effective application of policies designed to maintain the security of the project in a manner consistent with traditional American concepts of justice and rights of citizenship.

The Commission is revising its hearing procedure entitled "Interim Procedure" for the review of cases of denial of security clearance and for the conduct of hearings for employees desiring such review. The interim procedure announced April 15, 1948, places considerable responsibility on the Managers of Operations and it is to provide uniform standards for their use that the Commission has adopted the criteria described herein.

Under the Atomic Energy Act of 1946, it is the responsibility of the Atomic Energy Commission to determine whether the common defense and security will be endangered by granting security clearance to individuals either employed by the Commission or permitted access to restricted data. As an administrative precaution, the Commission also requires that at certain locations there be a local investigation or check on individuals employed by contractors on work not involving access to restricted data. (Commission authorization to be so employed is termed "security approval.")

Under the act the Federal Bureau of Investigation has the responsibility for making an investigation and report to the Commission on the character, associations, and loyalty of such individuals. In determining any individual's eligibility for security clearance other information available to the Commission

should also be considered, such as whether the individual will have direct access to restricted data, or work in proximity to exclusion areas, his past association with the atomic energy program, and the nature of the job he is expected to perform. The facts of each case must be carefully weighed and determination made in the light of all the information presented whether favorable or unfavorable. The judgment of responsible persons as to the integrity of the individuals should be considered. The decision as to security clearance is an overall, common-sense judgment, made after consideration of all the relevant information, as to whether or not there is risk that the granting of security clearance would endanger the national defense or security. If it is determined that the common defense and national security will not be endangered, security clearance will be granted; otherwise, security clearance will be denied.

Cases must be carefully weighed in the light of all the information and a determination must be reached which gives due recognition to the favorable as well as unfavorable information concerning the individual and which balances the cost to the program of not having his services against any possible risks involved. In making such practical determination, the mature viewpoint and responsible judgment of Commission staff members and of the contractor concerned are available for consideration by the Manager of Operations.

To assist in making these determinations, on the basis of all the information in a particular case, there are set forth below a number of specific types of derogatory information. The list is not exhaustive, but it contains the principal types of derogatory information which indicate a security risk. It will be observed that the criteria are divided into two groups, category (A) and category (B).

Category (A) includes those classes of derogatory information which establish a presumption of security risk. In cases falling under this category, the Manager of Operations has the alternative of denying clearance or referring the case to the Director of Security in Washington.

Category (B) includes those classes of derogatory information where the extent of activities, the attitudes or convictions of the individual must be weighed in determining whether a presumption of risk exists. In these cases the Manager of Operations may grant or deny clearances; or he may refer such cases to the Director of Security in Washington.

#### CATEGORY (A)

Category (A) includes those cases in which there are grounds sufficient to establish a reasonable belief that the individual or his spouse has:

1. Committed or attempted to commit, or aided or abetted another who committed or attempted to commit any act of sabotage, espionage, treason, or sedition;
2. Established an association with espionage agents of a foreign nation; with individuals reliably reported as suspected of espionage; with representatives of foreign nations whose interests may be inimical to the interests of the United States. (Ordinarily this would not include chance or casual meetings; nor contacts limited to normal business or official relations.)
3. Held membership in or joined any organization which has been declared to be subversive by the Attorney General, provided the individual did not withdraw from such membership when the organization was so identified, or otherwise establish his rejection of its subversive aims; or, prior to the declaration by the Attorney General, participated in the activities of such an organization in a capacity where he should reasonably have had knowledge as to the subversive aims of the organization;
4. Publicly or privately advocated revolution by force or violence to alter the constitutional form of government of the United States.

Category (A) also includes those cases in which there are grounds sufficient to establish a reasonable belief that the individual has:

5. Deliberately omitted significant information from or falsified a personnel security questionnaire or personal history statement. In many cases, it may be fair to conclude that such omission or falsification was deliberate if the information omitted or misrepresented is unfavorable to the individual;
6. Violated or disregarded security regulations to a degree which would endanger the common defense or national security;
7. Been adjudged insane, been legally committed to an insane asylum, or treated for serious mental or neurological disorder, without evidence of cure;
8. Been convicted of felonies indicating habitual criminal tendencies;
9. Been or who is addicted to the use of alcohol or drugs habitually and to excess, without adequate evidence of rehabilitation.

CATEGORY (B)

Category (B) includes those cases in which there are grounds sufficient to establish a reasonable belief that with respect to the individual or his spouse there is:

1. Sympathetic interest in totalitarian, Fascist, Communist, or other subversive political ideologies;

2. A sympathetic association established with members of the Communist Party; or with leading members of any organization which has been declared to be subversive by the Attorney General. (Ordinarily this would not include chance or casual meetings, nor contacts limited to normal business or official relations.)

3. Identification with an organization established as a front for otherwise subversive groups or interests when the personal views of the individual are sympathetic to or coincide with subversive "lines";

4. Identification with an organization known to be infiltrated with members of subversive groups when there is also information as to other activities of the individual which establishes the probability that he may be a part of or sympathetic to the infiltrating element, or when he has personal views which are sympathetic to or coincide with subversive "lines";

5. Residence of the individual's spouse, parent(s), brother(s), sister(s), or offspring in a nation whose interests may be inimical to the interests of the United States, or in satellites or occupied areas thereof, when the personal views or activities of the individual subject of investigation are sympathetic to or coincide with subversive "lines" (to be evaluated in the light of the risk that pressure applied through such close relatives could force the individual to reveal sensitive information or perform an act of sabotage);

6. Close continuing association with individuals (friends, relatives, or other associates) who have subversive interests and associations as defined in any of the foregoing types of derogatory information. A close continuing association may be deemed to exist if—

(1) Subject lives at the same premises with such individual;

(2) Subject visits such individual frequently;

(3) Subject communicates frequently with such individual by any means.

7. Association where the individuals have enjoyed a very close, continuing association such as is described above for some period of time, and then have been separated by distance; provided the circumstances indicate that a renewal of contact is probable;

Category (B) also includes those cases in which there are grounds sufficient to establish a reasonable belief that with respect to the individual there is:

8. Conscientious objection to service in the armed forces during time of war, when such objections cannot be clearly shown to be due to religious convictions;

9. Manifest tendencies demonstrating unreliability or inability to keep important matters confidential; willful or gross carelessness in revealing or disclosing to any unauthorized person restricted data or other classified matter pertaining either to projects of the Atomic Energy Commission or of any other governmental agency; abuse of trust, dishonesty; or homosexuality.

While security clearance would ordinarily be denied in each of the foregoing categories (A), and (B), security approval as distinguished from security clearance, might be warranted in those types of derogatory information mentioned under category (B) above.

The categories outlined hereinabove contain the criteria which will be applied in determining whether information disclosed in investigation reports shall be regarded as substantially derogatory. Determination that there is such information in the case of an individual establishes doubt as to his eligibility for security clearance.

The criteria outlined hereinabove are intended to serve as aids to the Manager of Operations in resolving his responsibility in the determination of an individual's eligibility for security clearance. While there must necessarily be an adherence to such criteria, the Manager of Operations is not limited thereto, nor precluded in exercising his judgment that information or facts in a case under his cognizance are derogatory although at variance with, or outside the scope of the stated categories. The Manager of Operations upon whom the responsibility rests for the granting or denial of security clearance, and for recommendation in cases referred to the Director of Security, should bear in mind at all times, that his action must be consistent with the common defense and national security.

Senator HICKENLOOPER. It is because the matter of security clearances has not, in my view, been satisfactorily resolved and in fact, in my view, has become increasingly more unreliable, that I felt it imperative to speak now; I feel it imperative in the interest of a secure and reliable atomic energy program.

In this field of personnel security the provisions of the law are ample. The law provides adequate standards, but in the administration of the law those standards have been circumvented.

I have repeatedly stated that the entire purpose of our personnel security program is to detect the rare instances where subversives or other objectionable persons attempt to infiltrate into the program. This makes mandatory the investigation of all who have access to restricted data. There may be 50,000 contractor employees at the various installations; there may be 5,000 Commission employees, but, under proper circumstances and in certain locations, one subversive person or one conspirator, infiltrated and with access to certain information could destroy the security precautions of the entire enterprise.

Once an individual has been given a clearance with access to restricted data, whether an emergency clearance or a clearance after investigation, he becomes a part of the fraternity of those who have access to restricted data and is accepted as such by that fraternity.

It is, therefore, of the utmost importance that before such clearance is granted, every proper precaution must be taken, because information acquired as a result of access through clearance, cannot be expunged from a man's mind.

And now, Mr. Chairman, I shall take up what I shall designate as Case A.

Mr. LILIENTHAL. Mr. Chairman, at earlier sessions of this committee in public hearing individuals were referred to variously as hypothetical and then not hypothetical, were described in general terms, and those terms were then made less and less general until it is perfectly clear that individuals were identified.

Now, this is what may well occur here the rest of this morning and the rest of this week, and I think that the committee should have our views as to the dangers inherent in this, in terms of the standards of decency and fair play, of which we are so proud in this country.

I would suggest at the outset that if individuals are going to be identified—and they will be identified inevitably by the descriptions that are made of them—that it is just as basic to the security of our country as it can be that such individuals be called here and be permitted a hearing and be permitted to call their friends and those who believe in them, people who were consulted in the course of the clearance of these individuals.

If it is said that this will take a great deal of time, I think the answer is that the preservation of those fundamental decencies in the protection of an individual's good name against unwarranted besmirchment is something that takes time, and it has always been felt it is worth that time.

The CHAIRMAN. Mr. Lilienthal, Senator Hickenlooper assures me, and assured me in a conversation we had on this subject before this meeting commenced, that he does not intend to use any names, number one; number two, as I understand it, he does not intend to give suffi-

cient information of the kind and character which would identify the individual regardless of the name.

I suggest, Mr. Lilienthal, that we at least go forward on Senator Hickenlooper's first case for the purpose of finding out just how he intends to develop that now. If, as a result of that presentation, it seems to me that you should be heard further in respect to the question of divulging not only the names but sufficient information whereby the individual could be identified, I will be very glad to take up the matter, and it may be that we would have to discuss the whole subject in an executive session.

In view of the Senator's assurance, I think we should go forward for such examination as he cares to make within those boundaries.

SENATOR HICKENLOOPER. I have already said that I think the intimate details of this file and information in it are properly matters to be taken before the joint committee in executive session. I do not intend to go into those. I do not intend to open these files. There is no name on the file, there is no identification on them; I expect to give Mr. Lilienthal the name of the individual who is in the file so he will know who I am talking about.

I also want to call your attention to the fact that on two specific instances the Commission itself has made public by public press releases their action on security investigating matters. I can mention them. One was the Dr. Condon case, in which they made a news release at length, on that and their procedures; and the other was the Graham case, both of which were announced by the Commission; and I am not going even that far and name the individual who is the subject of the security investigation.

I shall try to guard this to keep identification details from creeping in to the point where this can be identified.

MR. COLE. Mr. Chairman?

THE CHAIRMAN. Mr. Cole?

MR. COLE. It appears to me as being rather unfortunate that Mr. Lilienthal has thrown out this apparent effort to protect the rights of citizens of this country in the fashion that he has because it creates the inference that he has doubts in his mind with respect to the attitude of this committee in that respect.

Now, I would like to inquire if you do have any basis for that doubt, if it is not a fact that during the entire association between the Commission and the committee that this committee has purposely and constantly tried to avoid attacks on individuals or to invade their personal rights or their liberties in any respect, and has there ever been an instance when it was necessary for some reason or another, and an individual connected with the program did come into the public light that, this committee has refused to give him a hearing?

MR. LILIENTHAL. Representative Cole, in the past the committee has, as you have described, dealt with these matters in executive session and has respected the gravity of the issue of individual rights that are involved, an issue which is even more important than atomic energy.

I might call your attention, if I may, respectfully, sir, to the fact that this morning we are meeting in open session. We have had an instance earlier in which individuals were identified by bracketing around them and therefore, without implying at all any lack of confidence in the committee's desire to pursue a sound constitutional

process here in the future, we are faced with quite a different problem because we are not in executive session.

This issue is of such importance because it is not possible, in our opinion, to deal with these individuals except in the total picture, so that excerpts chosen by the Senator from a file—

Senator HICKENLOOPER. I am not choosing excerpts from a file.

Mr. LILIENTHAL. If excerpts are chosen, it will make it necessary that the entire file be made available. I beg of you that I be permitted to read into the record at this point a letter from the Commission to you on this question so that the record may be clear as to the substantive issue we feel is involved here, and then proceed to the inquiry on the particular case, unless this is contrary to your wishes.

The CHAIRMAN. Well, I have no objection, certainly, Mr. Lilienthal, to your reading the letter, which was delivered to me this morning, as presenting your viewpoint and the background for a discussion of this matter.

I do want to call your attention to the fact that Senator Hickenlooper has assured me there would be neither the naming of individuals, nor, to use your phrase, bracketing of them by the statement of facts that would be sufficient to identify the individuals regardless of names.

But since this presents a basic issue which bears upon many facets of the investigation, unless there is objection, I think it will be permissible for you to state the viewpoint of the Commission upon this subject.

Senator HICKENLOOPER. Mr. Chairman, may I say this and make it clear I have no desire or intention to attack any individual. The purpose of my presentation is to show procedure and to show it in the interest of protecting the overriding rights of the whole public in this situation, and I am not going to name any individual, and I have no intention of attacking any individual as an individual, and I shall do everything I can to safeguard that.

I think the committee should go into executive session and examine this file at a later period. I think that is perfectly proper procedure.

The CHAIRMAN. So that we all may understand the difficulties that are presented in examining this matter, it will perhaps be wise for this letter to be read so we can thereby judge the background of the problem.

Mr. LILIENTHAL. Thank you, Senator. The letter is dated June 4, 1949, and reads:

DEAR SENATOR MCMAHON: The Atomic Energy Commission this week transmitted to the Joint Committee on Atomic Energy the FBI investigative reports made to this Commission on most of the individuals listed by Senator Hickenlooper. The remainder will be transmitted under separate cover.

Most of these investigational records have previously been examined by the joint committee or its staff and have been constantly available to it and to its staff; many have previously been discussed in executive sessions of the committee. In fact, 10 of the cases on the list were fully discussed in an executive session of the joint committee as long ago as November 28, 1947. Access at this time to these files could have been had without the public request made for them at the hearing by simply sending for them in accordance with the usual practice of the joint committee in obtaining such files.

It is, of course, true that the Commission can give full information in public hearings on the Commission's personnel security system, including general security standards and criteria and procedures for administrative review of individual cases. This we are prepared to do. We note, however, from press accounts that Senator Hickenlooper proposes in future open hearings to bring

up and discuss the security status of certain individuals in the atomic energy program.

We believe that the greatest care is required in connection with any public discussion of individual cases in order to assure complete fairness to individuals and in order to avoid serious adverse consequences to the morale of all the people engaged in the atomic energy program. The difficulties of attracting and retaining competent people to which Senator Hickenlooper referred in his statements on last Wednesday are, of course, greatly increased if people in the atomic energy program run a risk of undeserved injury to their good names which cannot be immediately redressed.

The use of the contents of these files, in open hearings, directly or by indirection, raises questions of procedure and of just plain human fairness. These are questions that go very deep. Your committee has made it abundantly clear that in pursuing its constitutional and statutory functions it does not intend to depart in any way from those fundamental decencies in the protection of the integrity of the individual which are so large a part of the American tradition of fair play and constitutional government.

The dangers of discussing so-called derogatory information cases in open hearings is not overcome by avoiding the name of the person. During the course of the open hearings before the Joint Committee on Atomic Energy this week, reference was made on several occasions to the personnel security status of several individuals who are or have been in the atomic energy program. As a matter of fact, a description of the place where a person is employed, the kind of work he is doing, and other such information, even though the person is not named, may identify a person as fully as if he were named. Furthermore, such a practice may have even more serious consequences because vague clues as to the identity of an individual may give rise to widespread speculation with a consequent spread of uneasiness and fear throughout the project and thereby injury to the interests of this country.

Any fair and adequate appraisal of whether a person should or should not be employed in the atomic energy program must include a careful analysis of many factors such as an evaluation of the reliability of the "derogatory" or unfavorable information regarding the person, the exact job the person is doing or has done, and how long the person has been engaged in the program. These cases are usually complex and must be viewed in the light of the total relevant information—including the elementary justice of hearing the individual's own side of the story. The investigative reports of the FBI are the foundation upon which the AEC personnel security system is based. As the FBI itself has pointed out, there are grave dangers in relying only on selected excerpts from FBI reports quoting anonymous persons. This danger, of course, is magnified when these excerpts are used in a public hearing.

As you know, the Commission has always made available to the joint committee upon request the personnel security files of all persons employed in the program for study and scrutiny by the members and by designated members of the staff of the joint committee. Indeed, as requested by the committee every step taken in some of the cases listed by Senator Hickenlooper was reported in detail to the joint committee last year. This close relationship has not been, in any way, disturbed by the President's directive of March 13, 1948, prohibiting the delivery of personnel security files to congressional committees by executive agencies without prior approval of the President. In fact, as you know, the Atomic Energy Commission at the time this directive was issued worked out special procedures with the Attorney General whereby the joint committee, provided strict confidence is maintained, continued to receive, upon request, the personnel security files, including the investigative reports, of any person in the atomic energy program.

The security of this country, that is to say, its basic strength, depends upon maintaining inviolate those fundamental decencies in protection of an individual's good name that have taken so many weary years to secure and safeguard. Security of the Nation is not only a matter of investigations and guards, but of a tradition and practice, a regard for and protection of the rights of individuals, even against the Government itself or its most powerful officials and legislators.

We know that your committee is fully aware of the serious dangers we have mentioned and are confident that you will insist upon complete adherence to procedures that assure fair play.

Mr. COLE. May we have for the record, Mr. Chairman, when that letter was received? I notice it was dated Saturday.

The CHAIRMAN. It was received this morning.

Senator HICKENLOOPER. Mr. Chairman, may I say again I am not attacking an individual here, I am attacking a procedure.

The CHAIRMAN. Might I say, Senator, in answer to Mr. Cole's question, that it was received this morning, and, as a result of receiving it, I telephoned Senator Hickenlooper and suggested to him the difficulties that are inherent in the development of information of this kind. The Senator did assure me that he intended to so conduct his examination as not to trespass upon our previous practice. Senator Hickenlooper has again reiterated that viewpoint this morning.

Senator HICKENLOOPER. Again, as I say, this is not an attack on an individual, I am not going to open this file, so far as I know at the moment. There is nothing in my mind or case that would indicate the opening of either of these files in this hearing or the presentation of any matters publicly except procedural matters at this time in an attempt to indicate in this and other illustrations what the procedural system is doing to the overriding security of the atomic energy program.

I may say also that so far as the particular case I am referring to, Mr. Chairman, it is quite well known to a substantial number of individuals who are not with the Atomic Energy Commission, who are not admitted to clearance, and has been known for some time to a substantial number of individuals completely outside of the project.

It is not, in fact, a completely secret matter, but I have no intention of divulging the name or attacking the individual, because that is not the purpose, and an attack on the individual is not involved in this hearing at all this morning. It is an attack on the system.

Now, case A, Mr. Chairman, shows that this person was given an emergency approval clearance under what they call an S. I. investigation—that is, files, checks for fingerprints.

I have here, Mr. Chairman, the name of the individual in the file. If you would care to look at it and then give it to Mr. Lienthal so he will know the name of the individual, I would appreciate it. I hope that the name is not—I hope great care is exercised that nobody sees that over anybody's shoulder. I do not object to the committee members seeing it, because they will see it in the file later anyway.

As I said, this man was given an emergency approval by the General Manager with what is called an S. I. investigation—that is, a file check, fingerprint check, and check of his references that he gave—on August 8, 1947. The investigation requested a change to a Q, or a full clearance in September 1947.

The first part of March 1948, serious derogatory information was developed by the FBI. In April, early in April, a month later, the employee was given a statement of charges and was suspended pending a hearing.

A month later, in the early part of May, a hearing was held for several days before a board composed of three Commission employees, one of whom, I believe, had just left the employment of the Commission a week or so prior to his sitting on this board, but had been a Commission employee, one was a lawyer, and two were scientists.

A month later, in June, the board unanimously recommended clearance.

Then about a week later, 8 days later, in fact, on June 18, the Assistant General Manager recommended clearance. On June 18, the

same day, the General Manager notified the Director of Security that the employee's clearance would be continued. On the same day, June 18, the Director of Security interposed no objection. On the same day, June 18, the General Manager notified the employee that his clearance would be continued and instructed him to report for duty as soon as possible. There is no record of any Commission action as such.

I am discussing what I consider to be the significant points in this case. I would like to mention first that this man entered on duty by way of the emergency clearance device. The serious derogatory information which was developed by the FBI in its investigation of the character, loyalty, and associations of this individual are contained in 50 single-spaced typed pages. I am not a security expert. It must be significant to anyone, however, that after a month of analyzing the case, the General Manager considered the information sufficiently serious to suspend the employee. After another month had passed a hearing was held before a board composed of three employees of the Commission appointed by the Assistant General Manager. As I said, one was a lawyer, the other two were scientists. None of them had any background of training which would enable him to be called expert in security infiltration.

There were in attendance, as observers, also two security officers from the Washington branch office. Mr. Lilienthal has properly described communism as a conspiracy which uses guile and infiltration.

I question the adequacy of this board to fully evaluate the ramifications of the information involved.

In any event, the chairman of this board announced at the outset that this was an investigation in accordance with the terms of the Atomic Energy Act, despite the fact that the FBI had already accomplished an investigation, the report of which covers some 50 pages.

Eighteen witnesses appeared before this board, 15 of them were summoned directly at the request of the individual whose clearance was involved. There were 24 informants mentioned in the FBI report who gave information directly about the person involved in case A.

Several dozen others gave information concerning his associations. Only two of the entire number whose information raised the substantial doubts about case A appeared before the Board, and a third was interviewed by telephone during the hearing.

The Director of Security and one of his assistants was summoned in one instance for purposes of cross-examination by the counsel of case A. The board, as has been pointed out, unanimously recommended clearance, and on June 18 there was a remarkable display of administrative efficiency.

On June 18 the Assistant General Manager recommended clearance in a letter to the General Manager. On the same day the General Manager in a written memorandum notified the Director of Security that the employee's security clearance would be continued. On June 18 by a written memorandum the Director of Security interposed no objection. And on June 18 the General Manager notified the employee that his clearance would be continued and instructed him to report for duty as soon as possible.

Now, that is the history of that case: An emergency clearance, serious doubt, suspension, a hearing before a board, which I believe with all due respect to the members of the board as individuals in their own particular line of work, but whom I believe to be completely inadequate to evaluate a security matter, the history of the witnesses as I have given, clearance by the board, and recommendation for clearance by the board and clearance for the individual.

I want to go back to February 2, 1949. By this time you have the name of this individual, Mr. Lilienthal?

Mr. LILIENTHAL. Yes; I do.

Senator HICKENLOOPER. You know him and know of the case, I take it.

Mr. LILIENTHAL. I know him and I know the case.

Senator HICKENLOOPER. You know generally of the history of the case; that it did occur?

Mr. LILIENTHAL. Yes.

Senator HICKENLOOPER. I am going back to February 2, 1949, at the first open meeting of the Joint Committee on Atomic Energy of this year. At that meeting early, at the beginning of the meeting, an armed courier accompanied Chairman Lilienthal of the Commission into the meeting; and, at Mr. Lilienthal's instruction, the armed courier delivered to Chairman McMahon a document for which the chairman had to receipt; and I want to read:

The CHAIRMAN.—

that would be Senator McMahon—

Is this a classified document, Mr. Chairman?

Mr. LILIENTHAL. This document is classified top secret because of its contents and particularly because of the contents gathered together in one document. I would say this is perhaps one of the hottest documents that has yet been assembled.

Mr. Chairman, a man against whom serious doubt was raised, warranting suspension, warranting a hearing before a board that I believe was not adequate to judge, a man upon whom there was a substantial file, creating serious doubt, is in charge of that report that was such a top secret and such a hot document that it had to be delivered by an armed courier and contained a compilation the serious import of which Mr. Lilienthal stated at that time.

That is case No. 1, Mr. Chairman, and the details, I think, should be gone into by the joint committee in executive session.

Mr. LILIENTHAL. Mr. Chairman, this simply carries out my apprehension and the predictions I have made. Senator Hickenlooper has firmly identified, by his most recent statement, this individual, and I think, in fairness, under the American system of fair play, this individual and those people involved in his report should at once, in my opinion, as promptly as the committee may desire, appear before you and go into the full record of this case.

He has identified the individual in the Atomic Energy Commission program who is responsible for the preparation of the quarterly reports of the Commission.

Senator HICKENLOOPER. I can find no objection to the concern about this matter, Mr. Chairman. I am concerned about it myself, and I am perfectly willing to have the man or any other men brought before this committee.

I believe the committee should examine details. I am not attacking an individual, and I did not raise the issue of the individual. It is the system which permits such individuals to be put into such embarrassing situations of this kind that I think must be corrected in the safety and security of our atomic energy program.

I did not request this individual to be brought for questioning; I did not cause him to be put before a board, and I did not cause him to get into the situation in which he finds himself now. I am not attacking this individual.

Mr. COLE. Mr. Chairman, did the Senator from Iowa identify the document which was submitted to the joint committee on that day in February? I did not realize that he identified the document. It was submitted.

The CHAIRMAN. It was submitted.

Senator HICKENLOOPER. The document is identified.

The CHAIRMAN. The document has been identified as the quarterly report.

Mr. COLE. I notice it has been identified, but I did not know it since—

The CHAIRMAN. It has been identified.

Senator HICKENLOOPER. Yes.

Mr. HOLIFIELD. I want the record to show at this point that I object to this type of investigation which is being thrown into the newspaper headlines and into the public print without any prior notice to the committee in executive session.

I want the record also to show that these charges of "incredible mismanagement" and incompetence on the part of the individuals in the atomic energy program, including this recent board that was referred to, have never been taken up in executive session from the standpoint of taking action on the part of the committee.

There have been discussions of the things, yes, but there has never been any recommendation from the chairman of the committee during 1947 or 1948 for the committee to take formal action on this matter, and there has been no such recommendation made since January 1, 1949.

I, therefore, think it is a dangerous procedure to throw into the public print matters such as these, which inevitably must be completely exposed without prior screening by the committee in executive session.

The CHAIRMAN. The difficulty that strikes me is that it would seem to be impossible to make any evaluation or worth-while estimate of a situation on the basis of Senator Hickenlooper's presentation.

Obviously, all of the file will have to be examined if any sensible conclusion on this individual in question is to be reached; and, equally obvious, it would be impossible in this forum to conduct such an examination. Certainly, it is not, in my opinion, a wise or judicious thing for this committee to be trying any number, or quite a number, of persons. Let me point out that it is impossible to do this job; and, therefore, it would seem to me to be almost impossible to proceed in the way the Senator has indicated that he is going to proceed. However, that is a matter that must be determined by the full committee.

It is also a matter that obviously has to be argued out in executive session.

Senator Hickenlooper, if you find it inconvenient or impossible to go forward on other matters at this time, the only thing that I think we should do is to recess the hearing temporarily until the

committee can convene in executive session for a further discussion of the matter.

Senator KNOWLAND. Mr. Chairman.

The CHAIRMAN. Senator Knowland.

Senator KNOWLAND. First of all, I want to say that I do not believe that Mr. Holifield is correct in his statement that matters of this kind have not been brought before this committee heretofore. I have personal knowledge—

Mr. HOLIFIELD. Mr. Chairman, I did not make that statement.

Senator KNOWLAND. Just let me finish that statement. I have a personal recollection of a number of instances where the committee was very much concerned over some of the procedures being followed in the way of personnel selection, and I myself, in discussion with Mr. Lilienthal and other representatives of the Commission, pointed out that I did not believe that anyone had a basic right to claim employment in the Atomic Energy Commission; that I felt that, because of the nature of the job and the security to the very Republic itself, the people selected, like Caesar's wife, should be above suspicion; and we had several rather hot and heavy sessions, I think, in which the junior Senator from California, as well as a number of others, expressed themselves very vehemently on that score.

I do not refer to this particular case which the Senator has raised, but I do refer to a number of other cases which greatly concerned me, and I think Mr. Lilienthal will recall the situation at that time.

Mr. LILIENTHAL. Yes. May I say this first?

Mr. HOLIFIELD. Mr. Chairman, I would like to have permission to answer that.

The CHAIRMAN. Mr. Holifield.

Mr. HOLIFIELD. The junior Senator from California, I believe, created the wrong inference. I know of many occasions when these matters have been brought before the joint committee for discussion, but I made it plain in my speech, as the transcript will show, that at no time during the 2 years 1947 and 1948, and 1949 up to date, was formal action requested by the then chairman of the committee that the committee should take action condemning such procedure, and recommending a change of such procedure as a committee action. Individuals expressed their opinion, but evidently it was not thought of sufficient importance to take full committee action on it.

Senator KNOWLAND. Mr. Chairman, just on that point, because I think it is important that it be cleared up, this joint committee, as such, has no administrative jurisdiction over the Commission. We are here as a "watchdog" committee.

Now, you certainly do not have to have a whole house fall on you if you are a member of the Commission to know what the committee was greatly concerned about. I think there is no member of the Commission who attended those meetings, but who will admit that the committee quite clearly showed it was concerned, and which got into this question of security clearance.

The CHAIRMAN. I remember very well a session that we had on the Friday after Thanksgiving in 1947. At that time we went into many cases, most of which had been in the project for some time, had been cleared into the Manhattan District and, I believe, on that occasion

we also discussed the reports on these individuals of the Roberts Board.

I would like to ask this question, Mr. Lilienthal: Has the Commission at any time overruled a recommendation of the Roberts Board?

Mr. LILIENTHAL. In two instances the recommendation of the Roberts Board was not followed, and since in both of these instances there had been public discussion, and the individuals concerned have themselves made public the results of the Commission's deliberations, I think, without casting suspicion, other vague suspicion, upon a lot of people, I should state what these two cases are.

One is the case of Dr. Edward Condon. The recommendation of the Roberts Board was that this matter not be determined by the Commission pending an early decision by the House Un-American Activities Committee.

This was quite a long time ago; that committee has not taken action. The Commission felt it could not dodge responsibility in that way, and respectfully disagreed.

In the other case, the case which was the case of Dr., now Senator, Graham, in which the Roberts Board had a different view, quite a different view than that taken unanimously by the Commission itself—

The CHAIRMAN. Who were the members of the Roberts Board?

Mr. LILIENTHAL. Mr. Justice, former Justice, Roberts of Philadelphia; former Ambassador Grew; Mr. Humphrey, of the Hanna Co., of Cleveland; Mr. Prentiss of the Armstrong Cork Co.; and Dr. Karl Compton, at that time of MIT. I should add, in responding fully to your question, Senator McMahon, there was, in addition to these two, definite inability on the part of the Commission to agree with the recommendation of the Advisory Board on the part in certain other cases—I am not familiar with them—the recommendations and the action taken varied in some particular. I would have to check on that.

Senator HICKENLOOPER. Mr. Chairman, if I may point out, in this case of Dr. Condon and the clearance information, it was well known that the matter was under consideration in connection with Dr. Condon's case.

The Roberts Board has been mentioned as having considered it. The information saying that there had been sufficient question to cause the Roberts Board to consider the matter, and the information saying that clearance had been granted, and the information saying who the individual was, was originated by Commission news release, and all I have said in this case is that I have said I am not attacking an individual; I am not discussing Dr. Condon as an individual; I am not attacking an individual in this case. I am saying that the individual did have a hearing; he had his clearance; the clearance was eventually given him. I am at the point of the fact that there was a substantial point being raised, but I have not released his name.

The CHAIRMAN. Of course, in the Condon case he had been designated as the "weakest link in the Nation's security," by the House Un-American Activities Committee. He was on public inquisition at the time; so, of course, any action by the Commission in his case would seem to be, as a matter of public policy, necessarily to be divulged.

However, all of this does not remove the basic difficulty which we have in regard to further proceedings on these cases.

I know, Senator, above all, that you do not wish to do anything that would discredit the person without a fair opportunity for him to reply, and it is equally obvious that we cannot conduct a series of those kinds of hearings in this forum.

Unless there is objection, I suggest that we recess at this time so that the committee may definitely canvass the situation and come to some conclusion on the matter.

Senator KNOWLAND. Before we recess, I do have one matter which I would briefly like to go into.

The CHAIRMAN. Of course.

Mr. LILIENTHAL. Before we go into that, if it is another subject, would the Senator permit me to just make——

Senator KNOWLAND. Yes.

Mr. LILIENTHAL (continuing). Two brief statements? One is that we are clear that the procedures and the standards developed through the years are very applicable to such a case as this, may be testified to in public, and we believe they should be, and I am sure the committee, at a proper time, will want to hear a statement, as the country I am sure will, of the care with which procedures have been developed. The procedures I am talking about are those referred to in case A.

Second, and this troubles me very deeply: It is a new thing, strange, and to me a very troublesome thing, in American life, and I believe it will be to the members of this committee, even to approximate the idea that the making of charges, the raising of doubts, and the raising of suspicion are in themselves a basis for condemnation of an individual. We just do not do things that way; and yet there is implied in this phrase Senator Knowland used about "above suspicion," which all of us use, the phrase that Senator Hickenlooper used, his own "serious doubts, charges," and so on. Charges and justice are two quite different things.

Now, the procedures we have set up, with the advice of many individuals, just as the procedures in the case of the President's loyalty program, are efforts to bridge the gap between charges, suspicions, doubts, ex parte derogatory information, so-called, and something resembling justice under the very difficult conditions of these cases.

The way we deal with this matter of protection of the individual ordinarily is to find a procedure, and a good deal of testimony about procedure, I believe, would be helpful.

This is a difficult field, and we are in a way pioneering with the desire, on the one hand, to preserve the protection of individual rights against the tarnishing of his name unjustly and, on the other, the protection of the security of the country.

The CHAIRMAN. I may say my difficulty comes from the fact that an eighth of a hearing is certainly not satisfactory, and I do not see how the full hearing can be held without violating the arrangements we have had in the past for the working out of these security matters. I am referring to the relationship between the Commission and the committee. That gives me great concern, because we do have access to these personnel security files, and as far as I know we are the only exception to the general rule that has been laid down that they are not to be opened up to any committee on the Hill.

Now, we do have them, and I certainly want to continue to have them. However, Senator Knowland, perhaps you can go into your matter.

Senator HICKENLOOPER. I just wanted to say, Mr. Chairman, that I did not originate the doubt in this case. The doubt was originated and charges were originated in the Commission.

The CHAIRMAN. Well, that may be true, but it does not remove the very great procedural difficulties which we now confront, and which I do think we must seriously discuss and consider.

Senator MILLIKIN. Mr. Chairman, may I ask a question?

The CHAIRMAN. Yes, Senator Millikin.

Senator MILLIKIN. Is it your claim that this particular person involved in this case has been identified?

Mr. LILIENTHAL. Yes, he has been identified.

Senator MILLIKIN. And identified by the questions of Senator Hickenlooper?

Mr. LILIENTHAL. Identified by the last part of Senator Hickenlooper's statement relating to the quarterly report of the Commission.

Senator MILLIKIN. Did this particular party have custody of what he described as a "hot top secret document"?

Mr. LILIENTHAL. Senator Hickenlooper's statement about his responsibility within the Commission for the preparation of the quarterly report is correct.

Senator MILLIKIN. That is correct?

Mr. LILIENTHAL. And his description of the report is correct.

Senator MILLIKIN. And is the same gentleman the gentleman who was a subject of the hearing described by Senator Hickenlooper?

Mr. LILIENTHAL. Yes; and I think since it is so clear that he is identified I should say flatly and unequivocally that on the basis of the record of inquiry there is no one I know of, and certainly this is true of me, who has the slightest doubt about the complete loyalty to this country of individual A.

Senator HICKENLOOPER. Again, inasmuch as that statement has been made, Mr. Chairman, may I point out that the record shows that only two people out of the literally dozens of people who provided information upon which the FBI report was based, were called before the board which reviewed this matter, that is, the people who gave information upon which doubt was raised were called before the board.

The CHAIRMAN. You see, Senator, that again emphasizes the difficulty, because you and I have seen cases in which there have been 35 witnesses on one side and two on the other side, and it is entirely conceivable that the jury should believe the two instead of the 35.

I do not say that is the case here, but it depends on who these individuals are. That, I think, just points up the difficulty we face.

It is a very unfortunate difficulty, one that I certainly wish did not exist. I certainly have the greatest hopes that in this investigation we can hold in open session every possible hearing to develop every conceivable fact that will bear upon the charges that have been made against this Commission.

I want to reiterate that. It is because I think we should make the decision in the light of that fact that I suggest that we go into executive session for the purpose of seeing how much we can develop, whether we can treat with it, gentlemen, at all in open session.

Now, Senator Knowland?

Senator KNOWLAND. Mr. Lilienthal, you recall that on June 1, I raised certain questions regarding security at the Argonne Laboratory. Do you have the information I requested at that time?

Mr. LILIENTHAL. The information has been received and it has been directed to Mr. Wilson, and it is, perhaps, well for him to answer that.

Senator KNOWLAND. It has not been furnished to the committee, though.

Mr. WILSON. It has just been received and will be furnished to the committee.

Senator KNOWLAND. Now, I would like to ask this—

Mr. LILIENTHAL. May we submit it now for the record, Senator?

Senator KNOWLAND. Yes, but I would like to raise a couple of questions, first, and then you may put it into the record.

Now, Mr. Wilson, you consider the Argonne National Laboratory one of the most important installations of the Atomic Energy Commission, do you not?

Mr. WILSON. Yes, sir.

Senator KNOWLAND. Do you regard the Argonne National Laboratory as one of the important installations of the Commission?

Mr. WILSON. I do, sir.

Senator KNOWLAND. It deals with highly classified information, among other things?

Mr. WILSON. Yes, Senator.

Senator KNOWLAND. All right.

I want to direct your attention, Mr. Wilson, to two sets of instructions issued, one on the date of April 22, 1949, a memorandum to all guards, signed by Mr. J. A. Pines, Chief, Plant Protection; and the second one dated May 10, 1949, signed by Mr. Pines, Chief, Plant Protection, to all guards. It is headed:

THE AUSTIN Co.,  
ARGONNE NATIONAL LABORATORY, SITE D.

Memo to: All guards.

Subject: Persons allowed unlimited access to property—amended list.

The following persons and their guests will be allowed unlimited access to all areas of the property at all times, upon identification of themselves:

Then, it lists 87 employees, presumably of the Argonne National Laboratory; 25 of the Atomic Energy Commission; 10 of the University of Chicago; 21 of the Austin Co.; 7 of Voorhees, Walker, Foley & Smith; 2 of Hanley & Co.; and 2 under what appear to be some initials, "L. K. B., F-W.," or a total of 154 people.

Again referring your attention to the instructions—

The following persons and their guests will be admitted.

Now, is that a customary security practice at the Argonne National Laboratory?

Mr. WILSON. Senator, does that state to what areas?

There is a large construction project at the Argonne Laboratory where there is no classified work going on.

Senator KNOWLAND. That area, I understand, is a restricted area, and I call your attention to the wording of the instructions to the guards "will be allowed unlimited access to all areas."

Mr. WILSON. All—

This is an instruction to the Austin Co. guards?

Senator KNOWLAND. That is right.

Mr. WILSON. The Austin Co., being engaged in the architectural and engineering work and construction, is in an unclassified area.

Senator KNOWLAND. I have been informed that this is a classified area, restricted area, but you may supply that information for the record.

Mr. WILSON. I should like to have an opportunity to do that, Senator, because——

Mr. PRICE. Could you tell us now?

Senator KNOWLAND. Would you have a guard security system to an unrestricted area?

Mr. WILSON. Yes. Yes; for theft of Government property, for various other controls.

Senator KNOWLAND. Is it not true that prior to the time the instructions were first issued, that it was required that people sign in and out of this particular area?

Mr. WILSON. I would have to check that, Senator, but I think——

Senator KNOWLAND. Would you check it with the security people at that area?

(See exhibit No. 8 in the appendix to follow the last part of these hearings.)

Mr. WILSON. I will, but I believe that what I can say on the point that you raised the other day will clarify the difference between the construction area, which is unclassified, where there is no restricted data, and any buildings or areas in which restricted data are located.

Senator KNOWLAND. Could you supply the information that you have?

Mr. WILSON. I believe you asked regarding windshield stickers issued at the Argonne Laboratory the other day.

No windshield stickers were issued to anyone at the Argonne National Laboratory permitting them to pass in or out of areas in which classified data or material were located without inspection of automobiles.

Green windshield stickers were issued, beginning November 24, 1948, for automobiles requiring access to the laboratory parking area, which is located within a general construction area, to which access is controlled for administrative reasons, but outside of the guarded security area in which classified data and material are located.

A detailed statement by the Director of the Argonne National Laboratory, together with copies of guard orders and other pertinent data are here, and I would like to submit them.

You asked about another point in regard to instructions to guards not to report security infractions.

No instructions have been issued to guards at Argonne National Laboratory not to report security infractions. All instructions to the guards at all posts at Argonne are made in writing.

A complete copy of all guard post orders is kept by the security officer of the laboratory, by the chief of guards, by the guard lieutenants and the director of personnel of the laboratory.

A guard at any one post has in his possession a post order book which contains all the general orders applying to his post and, in particular, special instructions applying to his post.

Further, at each guard post there is kept a log book in which is recorded all temporary special orders to that guard post, including the source of the instruction.

Further, a log book is kept at each guard post for the purpose of recording unusual incidents in which the guard at his own discretion is required to enter any incidents which, in his opinion, are unusual, which normally means any incident which is not completely routine.

Guard orders show absolutely no preference in security instruction for any officer of the Laboratory or the Atomic Energy Commission. The business manager of the Laboratory, the security officer and site administrators have all attested to the fact that at no time have instructions for special privileges with regard to security infractions been given verbally or otherwise.

You also asked a question with regard to the master key file.

By way of necessary background, it should be pointed out that there is no master key file, as such, containing master keys to all repositories or restricted data or materials at the Argonne Laboratory.

Practically all papers classified confidential or higher are located in three-way combination lock safe-cabinets or vaults, which cannot be opened by a key, and are in any event in steel locked file cabinets which are located in buildings or areas in which there is maintained a 24-hour security guard. Guard orders require the checking of such repositories on their regular watch-clock recorded rounds to be certain that they are locked.

A number of key file cabinets are located throughout the Laboratory in which keys to interior doors are stored. It is believed that the source of the query may have been connected with either one of the two principal key files. The operation of these key files is as follows:

The main security office of the Laboratory has within it the quarters of the Laboratory locksmith. Here there is a steel key cabinet which contains duplicate keys to many of the cabinets, doors, and desks throughout the Laboratory, with the exception of the recently constructed buildings at the DuPage site.

Master keys do not exist for any extensive series of doors or cabinets or desks and, therefore, this cabinet cannot be considered a master key file.

This key cabinet is placed in the security office headquarters so that it will be under 24-hour security guard. While not in actual use it is locked.

It is checked by the guards with respect to being locked, the same way in which all file safes and other officially locked repositories in the Laboratory are checked.

The Laboratory records shows that security infractions were entered against the Laboratory locksmith for leaving the key file unlocked at 7 p. m. on May 12, 1947; and again at 8:05 p. m., January 19, 1948.

These are the only security infractions recorded in connection with this cabinet. There is no evidence whatsoever indicating that other infractions occurred which were not reported.

The other key file cabinet which may have been the source of the query is located in one of the offices of a recently constructed building at the DuPage site.

This key cabinet is located around 8 feet from a 24-hour a day guard station, and the guard lieutenant for that area has access to the keys in the key cabinet.

Since the purpose to which this cabinet was put was altered approximately May 1, 1949, a description of the situation before and after that date is appropriate.

Acceptance of a newly constructed building by Argonne National Laboratory is accomplished by inspection of the building and the transferring of all keys to all doors of the building, switchboxes, and so forth, to the site administrator who will be responsible for that building. Also upon acceptance of a building by Argonne, all exterior doors are locked with the exception of those which are fully guarded night and day.

Up until approximately May 1, 1949, the keys of such buildings were divided into two categories. The first category included the exterior building door keys and master keys for the interior doors; these were stored in a locked file cabinet with a three-way combination safe lock.

The second category included keys to interior doors, such as the machine shop and stock room.

These were placed in the key cabinet referred to above. It should be understood that the keys in this key cabinet did not give access to restricted data or materials.

For instance, the key to the library would open the door leading to the unclassified book stacks, but the classified documents are kept, are stored in an interior room in three-way combination file cabinets.

Senator KOWLAND. Right at that point, if I might interrupt, Mr. Wilson, is it or is it not a fact that in some of the offices the cards which contain the combinations to these three-way safes are themselves locked in a desk?

Mr. WILSON. Instructions are that these be kept in safes with three-way combination locks.

Senator KNOWLAND. You mean the only combinations to the safe are locked in the safe for the three-way combination lock and there are none kept on the outside?

Mr. WILSON. None that I know of, sir. In one safe there will be the combination to other safes. Combinations are to be kept in safes.

Senator KNOWLAND. I would also like to ask this question, and I wish you would double-check the answer to that question as to whether all these combinations are, in fact, locked in a safe. Would you please check with your people at the Argonne National Laboratory on this site D, to find out whether or not it is a fact that there are one or more quonset huts in which classified security work is being conducted at site D, and report back to the committee?

Mr. WILSON. I will. May I continue, Senator?

Under these circumstances, up until April 15, 1949, no determined effort was made to keep this wall key cabinet locked at all times. In fact, there are reported two occasions prior to April 15, 1949, upon which the guards, finding the key cabinet unlocked, brought it to the attention of the site administrator. This was not reported as a security violation because, in fact it was not.

Subsequent to May 1, 1949, the purpose to which this wall cabinet is put has been changed. There are now filed within this cabinet the keys for all buildings which this site administrator has under his jurisdiction.

No master keys, however, of any kind are kept in the key cabinet. Such master keys remain in a three-way combination file safe.

Subsequent to May 1, 1949, the key cabinet has been kept locked at all times, and as pointed out, is under 24-hour observation from a nearby guard post.

It is also to be emphasized that the keys in this key cabinet do not give access to restricted documents or restricted materials. It does not contain master keys for the interior doors of these buildings. It has not been left unlocked since the time it contained complete building keys.

Without further information as to the origin of the query, the Commission must emphasize that as far as the ANL records show, and those of AEC, and as far as can be determined by inquiry, no instructions have ever been given to any guard to withhold security reports, reports of any security violations.

I would like to submit, if I may, for the record the statement by the Director of the Laboratory concerning this matter.

Mr. JACKSON. I think it ought to go into the record, Mr. Chairman.

The CHAIRMAN. Mr. Jackson has requested that it be read into the record, Mr. Wilson. Is it very lengthy?

Mr. WILSON. No. The master letter is not. There is an exhibit of the green sticker and so on.

This is a letter from Dr. Walter H. Zinn, director of the Argonne National Laboratory, addressed to Mr. Tammamro, Manager of the Chicago Directed Operations of the Commission, dated June 2, 1949:

DEAR MR. TAMMARO: The charge has been made that officials of Argonne National Laboratory were issued green stickers for their automobiles which permitted the passengers and the automobile entrance into restricted areas of the laboratory without a security check. This is a completely erroneous statement. The facts are as follows:

At the DuPage site, the east area buildings have been completed and occupied in series. The first building was occupied on August 16, 1948; the last has not yet been turned over by the constructors to the Laboratory. The security procedure adopted in this situation where buildings are operating units of the Laboratory while neighboring buildings are still in the hands of the constructor was to maintain the security firmly and in a fully authorized manner for the building itself. Therefore, the building itself becomes a controlled security area. The grounds around the building and the buildings under construction are a controlled construction area only.

That means that there is no classified or restricted data there, and they are not under security guard.

The letter continues:

A controlled construction area is controlled from the point of view of Government property safeguarding rather than from the point of view of safeguarding restricted data or materials within the meaning of the Atomic Energy Act. Each operating building of Argonne was guarded and controlled from a security point of view just as if it were located on a street in a city as are some of the other operating laboratories located in the city of Chicago, and as indeed is the atomic energy headquarters at 1901 Constitution Avenue. Laboratory employees who arrived at work in automobiles experienced very considerable difficulty in finding appropriate places for parking these vehicles. This is understandable as the hour of beginning work was subsequent to that of the many hundreds of construction workers. Therefore, an area for Laboratory parking was designated. This area, in no way was a controlled security area. It was not and is not a restricted area. Green automobile windshield stickers were issued to all Laboratory employees who desired them for the purpose of giving them, and only them, access to the Laboratory parking area. The guard on the road leading to this area had instructions to wave in without stopping cars carrying the green

stickers, but to reject construction workers or others and direct them to the construction workers' parking lot.

These green windshield stickers were issued by the Laboratory Security Office beginning November 24, 1948, to Argonne National Laboratory and Atomic Energy Commission employees who were required to acknowledge receipt of the sticker on the card attached as exhibit A. To date 525 stickers have been issued. It is emphasized that all employees were eligible for these stickers, no distinction being made on the basis of job category. That these were issued to officials only is disproved by the fact that 104 stickers were issued to project automobiles, 53 to maintenance personnel, 55 to guards, 105 to shop personnel, 50 to laboratory technicians and draftsmen, 31 to firemen, 1 to an employee of the Atomic Energy Commission, 1 to an employee of the University of Chicago Construction Account, 20 to administrative personnel of the Laboratory, and 105 to scientists and engineers.

It must be reiterated that the Laboratory security rules do not permit automobiles to enter controlled security areas. Parking lots are always established outside these areas making it unnecessary to search such vehicles. Wherever possible deliveries within controlled security areas are made by Government trucks with fully cleared drivers. In those cases where the nature of the delivery makes this impossible a guard escort is provided at the entrance gate, which escort remains with the vehicle at all times while it is within the security area. As an example of the care which is taken to eliminate nonproject vehicles from security areas, it should be pointed out that cafeterias are placed outside the controlled security areas so that deliveries of perishable food, et cetera, are not required to enter the security area.

Senator KNOWLAND. Now, Mr. Chairman; I want to have printed as part of the record these instructions to the guards. I want the General Manager to supply, or the Commission to supply to this Committee, a map of Area D, the specific information as to whether or not there are quonset huts which are conducting security work within Area D; and I want again, after he gets that information, I want the General Manager to tell us whether or not these instructions, which read: "The following persons and their guests will be allowed unlimited access to all areas of the property at all times upon identification of themselves," and then which lists 154 names and the instructions which go on to state, "The only registration required will be at the point of contact of the persons listed above (not their guests), and this registration"—that is, the registration of even these people—"will be necessary only after normal working hours, Saturdays, Sundays, and holidays," so, as I read the instructions, providing they mean what they apparently say, if they come in during the normal working hours they will not even list the 154 people given here, to say nothing of their guests.

Then it goes on to further say, "This listing is to be carried on each guard's person at all times when on duty at this site."

Mr. WILSON. This must refer, Senator, to the construction area which is controlled purely for administrative purposes in connection with Government property.

Senator KNOWLAND. I think you will agree that it does not limit itself to the construction area. It says, "all areas," so will you please supply a map showing this Area D, showing the quonset huts where any security work is being done, so that this Committee may reach a final decision on this matter.

Mr. WILSON. I will, Mr. Senator.

The CHAIRMAN. It would seem, Mr. Wilson, that you could get this information by telephone.

Mr. WILSON. I can.

The CHAIRMAN. I think, in view of the nature of the situation, you should put in a call to Chicago and find out what areas are meant by "all areas." I personally would like that information this afternoon.

Mr. WILSON. I will get it, Senator.

Mr. Chairman, may I submit the additional papers that I have from the Argonne National Laboratory which I would like to have placed in the record?

The CHAIRMAN. Yes; they may be placed in the record.

(See exhibit No. 8 in the appendix to follow the last part of these hearings.)

The CHAIRMAN. Gentlemen, I know you all have questions, and I want to give all of you an opportunity, but I know of no better way to do it than to proceed in this order, in an orderly way.

Senator Vandenberg?

Senator VANDENBERG. Mr. Chairman, I am simply curious about this document that Senator Knowland has submitted. Apparently, whether this is a restricted area or not, the Commission apparently considers it important, at least, to list whom they consider eligible to enter under this authority.

That is true, is it not?

Mr. WILSON. Yes.

Senator VANDENBERG. Well, if it is important that you should restrict the entry to those who were listed, what is the necessity for a complete unlimited right of entry for their guests, and why, at the finish, when you finally require registration, even of those whom you have listed, do you eliminate the guests from registration? What is this business about these guests? Why should they have a freedom which you deny to even those you list?

Mr. WILSON. Well, Senator, it is my firm belief that this means admission to the construction area, where there is no security involved, no restricted data involved.

I am not familiar with the particular instruction which you are reading, but I shall certainly check up on it promptly.

Senator VANDENBERG. If it applies to that limited area, why go to the trouble of identifying anybody?

Mr. WILSON. Well, the purpose of administrative control of that area is for the purpose of avoiding the possibility of theft of Government property. Therefore, whoever comes in outside of normal working hours, those who are there during normal working hours are registered in on their employment status, must register that they have come in—this is out of hours. Now, they are responsible for anybody who was with them.

Senator VANDENBERG. Yet you very carefully notify the guards not to take any notice of who is with them and not even to register who is with them.

Mr. WILSON. Well, the person who brings them in is responsible for them. That is the reason, I assume, Senator.

Senator VANDENBERG. It is a very curious arrangement.

Senator KNOWLAND. Will you be sure when you phone Argonne this afternoon that you find out what security there is in the way of fences, guard posts, or other means of security between the area that you think this admits them to, and other areas where there may be

restricted work going on, and whether it is in fact necessary to pass a second guard post or go through a second gate once they have had access to this whole area, which apparently by this gives them unrestricted access to all areas within site D?

Mr. WILSON. I am certain that that is the case, Senator, but I will get the details for you this afternoon.

The CHAIRMAN. Mr. Holifield?

Mr. HOLIFIELD. No questions.

The CHAIRMAN. Mr. Cole?

Mr. COLE. Yes, Mr. Chairman.

Reverting to the procedure under the Roberts Board, and particularly the Condon and Graham cases which have been mentioned this morning, I am not certain of my understanding of the Roberts Board, and its part in the clearance program and the Condon and Graham cases; I am not certain that it is correct, and I want to make it certain that I do understand it correctly.

First, the Roberts Board was created by the Commission as an auxiliary to lend assistance in the security clearance problem, was it not?

Mr. LILIENTHAL. Yes, an advisory board on criteria and because of the backlog of cases.

Mr. COLE. I assume the Commission made the effort, at least, of engaging as competent and prominent and capable and impartial individuals in the country as it possibly could, because of the nature of the responsibility?

Mr. LILIENTHAL. That is correct, sir.

Mr. COLE. And I feel that the Commission must feel a measure of success in that regard when it is known who the members of the Roberts Board were?

Mr. LILIENTHAL. Yes, indeed.

Mr. COLE. Now, is it correct that the Roberts Board did report adversely on the two cases with respect to clearance?

Mr. LILIENTHAL. The Roberts Board did not, as I recall, report on the merits of this Dr. Condon case. Their report, which is in the records, the records which have been supplied—

Mr. COLE. No, but bear in mind that I am not asking you to disclose anything of a personal or confidential nature that you do not feel should be disclosed.

Mr. LILIENTHAL. I understand the question relates to procedure, sir, and my recollection of the minutes of the Roberts Board action, which are in your files, and I shall not go beyond those minutes, is a recommendation that in the case of Dr. Condon, inasmuch as the House Committee on Un-American Activities was investigating or had investigated Dr. Condon, or in any case had issued statements concerning him, and that it might well be that they would give Dr. Condon a hearing, which up to that time they had not given and which up to this time they have not given, that it would be better if the Commission would await completion of action by the House committee before taking action of its own.

The question, therefore, was limited, Representative Cole, as we understood it, purely to the question of procedure. The Commission took

a different view and felt that in the first place, when the Committee on Un-American Activities would hold a hearing and would dispose of the case appeared to be quite unpredictable and, as it turned out, was unpredictable, that this would appear to evade the Commission's responsibility to meet the issue and decide the case, and this we did.

Mr. COLE. Now, with the other case you do not need to discuss it if you do not care to, except to indicate whether the Commission followed the Roberts Board recommendations or not.

Mr. LILIENTHAL. The Commission did not follow the recommendations.

Mr. COLE. The next point is whether those facts which you have just indicated were disclosed by the Commission in some public statement when the subject was of public interest.

Mr. LILIENTHAL. The facts in respect to the case of Senator Graham were not disclosed so far as the recommendations of the Roberts Board were concerned.

Mr. COLE. Well, they have been disclosed at some time or another.

Mr. LILIENTHAL. Mr. Cole, the situation is this: that the Commission's memorandum of decision in respect to the clearance of Senator Graham was made public, and with his consent, but we did not indicate in this memorandum what position the Roberts Board had taken in the matter, and for what seemed to us a good reason.

Mr. COLE. When did it become public knowledge what the action of the Roberts Board was?

Mr. LILIENTHAL. Mr. Cole, I believe it was announced to the world by a radio commentator, who apparently had access to this information. It was not announced by the Commission, and the reason for this was again a question—its fairness will, I believe, appeal to you; Senator Graham at no time was apprised of the contents of the investigative report, nor did he have a hearing.

To have indicated in the Commission's memorandum of decision that there were circumstances that might reflect on him would require, it would seem, that he should at the same time have a hearing. The Commission did not feel then, and does not feel now, that anything in Dr. Graham's record warrants or occasions a hearing, and it was for that reason, the absence of a hearing, that this circumstance was not related in the Commission's memorandum of decision.

Mr. COLE. When was this disclosed by the radio commentator, about the action of the Roberts Board on the Graham case, approximately how long ago, 6 months?

Mr. LILIENTHAL. Well, I do not keep up with this particular commentator [laughter] but I think it was about 6 months ago.

The CHAIRMAN. You should. [Laughter.]

Mr. COLE. Well, I had no idea to whom you were referring when you said that it was a radio commentator, but I think I have a good idea now. [Laughter.]

The fact of a hearing by the Roberts Board is the very thing that is the object of my inquiry, whether the Commission after it was disclosed to the public that the Roberts Board had acted adversely or in a questioning way with respect to individuals, whose identity was known, if the Commission opened the door of opportunity to those individuals for a public hearing by the Roberts Board.

Mr. LILIENTHAL. I wonder if we are clear on this. The Roberts Board did not have a hearing in this matter; no hearing was ever had.

Mr. COLE. On the Graham case?

Mr. LILIENTHAL. That is Dr. Graham, Senator Graham, did not have a hearing.

Mr. COLE. Yes.

The CHAIRMAN. Incidentally, he will have his chance to appear before this Committee before this investigation is concluded.

Mr. COLE. That is fine, but the thing that arouses my curiosity is whether Dr. Graham has ever been given an opportunity to present his side of the case, whatever it may be, to the Roberts Board. If he has ever been given an invitation, if an invitation to do that has ever been extended by the Commission or by the Board itself is what I am curious about.

Mr. LILIENTHAL. The Roberts Board's conclusions or recommendations in respect to this matter were based on the paper file. The Commission's conclusions in choosing not to follow recommendations of its advisers was also based on the file. The Commission did not feel then, and does not feel now, that there is anything—I mean, with respect, and great respect, due to the distinguished advisers of the Commission—the Commission did not feel that a hearing was warranted, that there was any occasion for a hearing. There was not sufficient doubt raised by the file to justify a hearing.

Now, a hearing apparently will be had now before the Joint Committee, but we did not feel that there was anything to warrant taking that step.

Mr. COLE. And yet, in the face of that, you have a determination, a recommendation by a creature of the Commission itself, composed of the most competent people in the country that the Commission could engage, of finding along a certain line with respect to the loyalty and security of an individual.

Mr. LILIENTHAL. Well, that is not quite——

Mr. COLE. And it became public knowledge through some fashion or other that this was the fact, and yet apparently the Commission was not sufficiently disturbed about invading the rights and personal prerogatives and liberties of that particular individual to make an issue of it and to open the doors of the Board or of the Commission to responses by the individual involved.

Mr. LILIENTHAL. The Commission felt then that here was a case where honest men could differ. We differed with the members of the Roberts Board in this particular case. The idea of suggesting that Senator Graham's loyalty to this country was such a matter of doubt requiring that he be given an opportunity to be heard upon it, frankly, seemed fairly farfetched. One is unhappy to disagree with such distinguished men, but there are cases where one must disagree with one's advisers if one has the ultimate responsibility.

Now, about the time the word about the action of the Board, which was confidential, and was intended to be confidential because of its relationship to the Commission, became bruited about, the curious circumstance transpired that this alleged security risk became a Member of the Senate of the United States, and was sworn in as such a Member, and is now associated with you gentlemen on the Senate side.

At this point it would have seemed very inappropriate indeed for a committee then to pass upon the security status of Senator Graham.

Mr. COLE. Of what committee?

Senator MILLIKIN. We did not give him or any other Senator security clearance, Mr. Lilienthal.

Mr. LILIENTHAL. No; I suppose that is right.

Senator MILLIKIN. There is a difference.

Mr. COLE. You are saying that it would be inappropriate for the committee to pass upon it?

Mr. LILIENTHAL. No; for the Commission to have then had a hearing calling into question the character, loyalty, and association of a man who then became a Member of the Senate of the United States. This seemed a little bit difficult to imagine.

Mr. COLE. I have not indicated, I hope, that it is my belief that the Commission itself should have conducted an investigation or a hearing at any time, whether it be before or after the individual became a Member of the Senate.

Mr. LILIENTHAL. I realize that.

Mr. COLE. But I do think that irrespective of the position that the individual may hold, even if it be that of a Member of the United States Senate, that the Commission might extend an invitation to the individual to have a hearing if he so desired.

Mr. LILIENTHAL. I think there is an additional set of facts here that should be added, and that is that there was consultation, it is my understanding, between the members of the joint committee and Dr. Graham in respect to hearings, as well.

Mr. COLE. I am not advised of that, and if the chairman of the committee is advised, I think it might be well to confirm or explain what the committee did with respect to any consideration of hearings of Dr. Graham.

The CHAIRMAN. Senator Graham advised me that at what we considered to be an appropriate time, he would like to be heard on the matter.

Mr. COLE. The last recollection I have was that some members of the committee were insistent on immediate hearings.

The CHAIRMAN. Well, if it is the desire of the Representative to move for an immediate hearing on Dr. Graham, I will be glad to entertain the motion.

Mr. COLE. No, the chairman misunderstands me. All I was trying to disclose was the fact of the decision of the committee. I do not realize or remember that the committee reached a decision that whatever hearings might be held would await the decision of the individual involved. If I am wrong in that, very well and good. I am not trying to be critical of what was done. I am simply trying to establish what was actually done.

The CHAIRMAN. Well, Senator Graham became a Member of the United States Senate, and talked with me about this matter. He suggested that at the proper time he would be very happy indeed to talk to the joint committee in either open or executive session regarding the matter.

Senator MILLIKIN. Mr. Chairman, might I interrupt for just a moment? I have had some interest in the Graham case, and I think I said to the chairman that if the matter developed to where the fact of

Dr. Graham's name got into the public mention, that as far as I was concerned, I would like to see him get a hearing. The chairman and I had that kind of a conversation so far as Dr. Graham is concerned.

The CHAIRMAN. That is right, Senator.

Senator MILLIKIN. I should like to add also that all of these matters were cleared prior to the time that Dr. Graham became a United States Senator, so the question of becoming a United States Senator, unless that has peculiar significance, has nothing to do with the case.

The CHAIRMAN. My recollection is, Senator, that you had a conversation with me prior to your going to Colorado, in which you suggested that it be held in abeyance until you had made the necessary trip, and that when you returned we would have a further conversation; I was awaiting word from you on it. That is my recollection.

Senator MILLIKIN. That is correct, and I think it was thoroughly understood that Dr. Graham was to have a hearing if his name was publicly mentioned in the matter, and I still feel that way about it.

The CHAIRMAN. At any rate, we can settle this matter before this investigation is over by having Senator Graham here because he has requested an opportunity to come here.

Are you through, Mr. Cole?

Mr. COLE. Yes.

The CHAIRMAN. Mr. Price?

Mr. PRICE. No questions.

The CHAIRMAN. Mr. Elston?

Mr. ELSTON. Mr. Lillienthal, I take it in your letter that you offered in evidence this morning one of the cases you were referring to was the party at the Argonne Laboratory who was referred to at our last meeting?

Mr. LILLIENTHAL. Yes; I did, Mr. Elston.

Mr. ELSTON. I call your attention to the fact, in case you do not remember, that the only identification of that individual came from your General Manager. My questions were purely hypothetical and it was he who said something about the person's being employed at the Argonne Laboratory. Do you recall that?

Mr. LILLIENTHAL. I would beg to differ with you, Mr. Elston, most respectfully. I think your hypothetical statement was a very clear identification of an individual; whether are not you intended it to be so or not, of course, is another matter, but it did have that effect, and there was, therefore, nothing really left to do but confirm it.

Mr. ELSTON. I may state that there was not a newspaperman or anyone else in this room who had the remotest idea to whom I was referring, and they were just as much surprised as I was when Mr. Wilson identified him as an employee of the Argonne Laboratory.

Mr. LILLIENTHAL. I am sure that while that might well be true with respect to newspapermen or others in this room, it would not be true in the area where this man works. It would be clear identification of him, so it would just be a lag of a few hours until the identification was complete.

Mr. ELSTON. You do not mean to say that he is the only person who has been arrested and who has denied in his P. S. Q. that he has been arrested?

Mr. LILLIENTHAL. Well, the identification of his function and the arrest—I do not have the record before me—I think justified simply

the word of caution that the Commission sought to bring to bear here—that merely not mentioning names does not in itself protect the identity of individuals. That is all I had in mind, Mr. Elston.

Mr. ELSTON. Do you know of the name having been mentioned by any newspaper, in any newspaper, or by any commentator?

Mr. LILIENTHAL. No; not yet.

Mr. ELSTON. Now, so far as the case referred to by Senator Hickenlooper is concerned, the person who brought this document to your committee, was he the only person who came to the committee that morning?

Mr. LILIENTHAL. My recollection is that the statement by Senator Hickenlooper did not relate to those who brought the document, but to the individual in charge of its preparation, and this is completely bracketed.

Senator HICKENLOOPER. That is completely correct. The courier or the guard to whom I referred was only a guard of the particular document and had nothing to do with the file that I referred to.

Mr. ELSTON. Yes. Well, I just wanted to say that if I had not seen the name this morning I, as a member of this committee, would not even know who the individual was.

Mr. Chairman, I think you indicated that you would meet in executive session if there was no objection. I just wanted to state to the chairman that I see nothing in the case referred to by Senator Hickenlooper which requires consideration in executive session of that case or any other, at least until there is something more before the committee.

If the committee is to go into executive session and all these cases are to be considered there, the public, who has as much right to know what is going on in the Atomic Energy Commission as anyone else, is going to be deprived of information to which I think they are entitled.

I quite agree with Senator Hickenlooper that names should not be mentioned. There is not any necessity for the mentioning of names in order to describe a policy that the Atomic Energy Commission has been following, and if there are some persons who might be identified because of their position or because of other circumstances, if the names are not mentioned here, the names will not be published, I am quite certain; but I submit that the public is entitled to know what is going on in the Atomic Energy Commission.

I do not think they should be limited to the rosy speeches that have been made by Mr. Lilienthal or others around the country indicating how beautiful everything is within the Commission. They are entitled to all the facts and, particularly in view of the charges that have been made by Senator Hickenlooper, and he should be given every opportunity to establish the case, and establish it in an open meeting. Those are my views.

The CHAIRMAN. I may say, Mr. Elston, the occasion of the executive meeting is not this particular case. It is the consideration of the whole subject and, of course, you and all the other members of the committee will be accorded the opportunity—of course it could not not be denied you and should not be denied you—to make your views known in that meeting, and we can discuss it very thoroughly.

I am entirely in sympathy with you in your desire to have all the information brought out that can possibly be brought out here in the open.

At the same time, I do see, if you do not see, the difficulties with which we are faced in the trial of persons upon insufficient evidence, and upon evidence that cannot be produced for open inspection.

I again state to you that one-eighth of a trial in the open, and seven-eighths in secret is not my idea of a proper assessment of worth or the lack of worth of the individual concerned, the particular individual.

I merely cite that to show you one of the difficulties that is troubling me.

Senator HICKENLOOPER. Mr. Chairman, at this point may I again emphasize, may I again just emphasize, that this morning I was not attacking or charging any individual in case A with anything. I was using case A as an illustration of procedure, and whatever is contained in that file, I think, is proper information for the joint committee in executive session. But I merely wanted to reemphasize that again.

The CHAIRMAN. I am glad to have that statement, Senator, because it does give a basis for believing that you have an appreciation of the difficulties with which we, as a committee, are faced.

Senator KNOWLAND. Mr. Chairman, I would like to ask Mr. Lilienthal one question.

The CHAIRMAN. Senator, would you mind if I gave an opportunity now to Mr. Jackson to address a question?

Mr. JACKSON. Mr. Chairman, I think it is quite obvious that if we are going to discuss hypothetical cases that we should give all of the facts in the case, including the names. What has transpired up to now should make it obvious to every member of the committee that when we try to discuss a hypothetical case we end up with the name.

Senator HICKENLOOPER. This is not a hypothetical case but an actual case. This case A that I am talking about is an actual case.

Mr. JACKSON. An actual case. Well, we started out with some hypothetical cases. The facts, however, seem to fit into actual cases, as least that is what experience last week has shown.

I am quite convinced that while it was indicated at the outset that people were not going to be identified, however, the first case we bring before the committee we do everything but name the individual; we point him out, that he is in charge of a certain document and, certainly, if the newspapermen in this room cannot figure out his name, the newspaper profession is slipping, and I think that in all fairness to people who are going to be brought up by case numbers or whatever it is, I think the individual ought to be advised in advance and appear here before this committee, and that the members of the committee be given an opportunity to know the facts in the case; and I do not want to, as the chairman indicated, listen to one-eighth of the evidence and try to pass judgment on some individual; and I might say that in all of these cases, time is of the essence, and it is not fair to start to make an attack on a person by referring to an FBI file, and then 3 or 4 days later bring the individual up here.

I think this individual ought to be up here this afternoon. I hope we can come to that conclusion as a result of our executive session.

Now one other thing: I would like to suggest that in view of all the discussion that has taken place in connection with the security problem at the Argonne National Laboratory, that we have the security officer of the Argonne National Laboratory before this committee.

From what little I have been able to gather from the testimony, I take it that there are two situations at the Laboratory. One is a construction project where there is no clearance involved, and the other is the security area, where classified documents and secret data are contained; and I think that in order for the committee to understand what all of these transcripts are about, and memoranda, and so on, that we have the security officer from the Argonne National Laboratory before the committee.

I would like to make that as a motion or a recommendation or whatever form is applicable.

The CHAIRMAN. Without objection the Director of Security of the Argonne Laboratory will be produced.

Mr. WILSON. Yes, sir.

The CHAIRMAN. Now, gentlemen, we have gone through the list of those entitled to question the witness.

Senator Knowland?

Senator KNOWLAND. Just two things along the line of Congressman Jackson's statement: When we have the Security Director at Argonne before us, I think if you will examine the transcript of June 1, I also asked to have brought before the committee for our inspection the inventory or whatever it was, covering the shipments of these bottles of uranium, including the bottle which was missing, and later showed up, was dug out, showing who forwarded it, who receipted for it, so that we can get a prima facie case on the matter of security in regard to the shipment of restricted materials such as uranium.

The second thing I would like to ask Mr. Lilienthal is just this as a matter of information, if he does draw some distinction between a person to whom the Commission may have fallen heir, we will say, from the Manhattan District, where they had a going concern who, if information later shows up, as a Government employee, would be entitled to a hearing and a hearing process; and a person who is starting from scratch, who files an application and says, "I want to work in atomic energy; give me a job."

Do you or do you not draw a distinction between the two types of cases?

Mr. LILIENTHAL. Is the Senator asking whether applicants are entitled to hearings prior to their employment? Is that it?

Senator KNOWLAND. That is right.

Mr. LILIENTHAL. The Commission has not reached a conclusion on that up to the present time. Hearings are not held.

Senator KNOWLAND. Do you not think there is a considerable difference between a person who comes for the first time to the Commission—

Mr. LILIENTHAL. Oh, yes.

Senator KNOWLAND (continuing). And says, "Because I want to work in the Commission I want you to give me a job," and their record is fairly filled, we will say, with these doubtful pieces of information on an FBI report, that the Commission has adequate reasons to refuse

employment, and it is a different situation from removing a person from his job who is already in his position?

Mr. LILIENTHAL. It is quite different.

Senator HICKENLOOPER. Mr. Chairman, at that point let me point out one of the objections to the emergency clearance device. Three thousand and more people have been brought in under emergency clearance, and then they become job holders, they are no longer applicants. They are already on the job, and the procedures that are set up for job holders then apply to them. The investigation is not applied to these people when they are applicants in many cases, and that is one of the inconsistencies.

Senator KNOWLAND. I appreciate that, and I think it is a little different category, different from a person who had been employed for some period with the Manhattan District, and then something turned up in the record.

Senator HICKENLOOPER. Oh, yes.

Senator KNOWLAND. I think this may be a wide-open loophole in the existing security, this matter of clearance, which we will have to go into further.

Mr. LILIENTHAL. Senator, I think one ought to say at this point that when the Manhattan District was transferred to the Commission and the reinvestigation process began, as required by law, the Commission did inherit a rather considerable number of cases in which questions were raised, and that these formed the bulk of the Commission's concern in personnel security matters, and also the Roberts Board work, as the committee recalls.

The Army found that these individuals, whatever may have been the state of the record, were to be regarded as suitable risks or they would not continue them.

The point that the Senator makes, with which I firmly agree, is that that case is different from the case of an applicant, but it does not solve the problem of the applicant. There are several considerations there, and at the proper time I would like to have an opportunity to explore them here with you.

The CHAIRMAN. Now, if there are no further questions, Mr. Elston raised the point that he is not in favor of an executive session to discuss this policy matter. I take it from the lack of acquiescence of any other member that others join with him. I shall so consider that the other members of the committee are quite willing to have an executive meeting to discuss these subjects.

Mr. ELSTON. Mr. Chairman, let me make myself clear. I have no objection to meeting and discussing. I merely indicated that I was not in favor of disposing of all these questions in executive session. Anything that has to do with the subject under investigation, and anything that is relevant, the public is entitled to hear, and we are entitled to have it in open session.

I am not objecting to the committee meeting in executive session for the purpose of discussing anything.

The CHAIRMAN. I am glad to have that clarification. I misunderstood your point of view.

If there are no further questions, the committee will meet in executive session at 4 o'clock in G-48, which is our regular meeting room.

(Whereupon, at 12:50 p. m., the committee adjourned, subject to the call of the Chair.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

WEDNESDAY, JUNE 8, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to notice, at 10:30 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon, Representative Durham (vice chairman); Senators Connally, Vandenberg, Millikin, Knowland, and Hickenlooper; Representatives Price, Jackson, Cole, Elston, and Hinshaw.

Also present: David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Gordon E. Dean, Commissioner; and Henry D. Smith, Commissioner; all of the United States Atomic Energy Commission.

Carroll L. Wilson, General Manager, Joseph Volpe, Jr., General Counsel; Everett Hollis, Bennett Boskey, of the Office of the General Counsel; Fletcher C. Waller, Director, Division of Organization and Personnel; R. A. Haney, Division of Security (Information); Bruce Uthus, Chief, Physical Security; C. A. Rolander, Chief, Violations Branch, Division of Security; Morse Salisbury, Director, Division of Public and Technical Information Service; Francis Hammack, Acting Director, Division of Security; James Yore, Director, Security, Chicago Operations Office; Robert Hessler, Security Officer, Argonne National Laboratory; Drs. Ralph Johnson, Paul McDaniel, and Spofford English, Division of Research, all of the United States Atomic Energy Commission; Charles Kenneth Weidner, chief engineer, special construction account, University of Chicago.

The CHAIRMAN. The meeting will come to order. Will the Commission come up here please.

Gentlemen, as you undoubtedly are aware, we are deferring the personnel security phases of this matter for further deliberation in committee, which we expect to accomplish before the end of the week.

In the meantime, Senator Hickenlooper has some other matters which he wishes to take up with you this morning.

Senator Hickenlooper?

Senator HICKENLOOPER. Mr. Chairman, this morning I would like to bring the record up to date on the emergency clearances situation to which I referred on last Thursday, because I now have the report for April 1949, on emergency clearances.

Now, to preface that and to make the record completely clear, I would like to read into the record verbatim at this point the two provisions with respect to clearances. I will read now from section 10 (b) (B) (i), which is as follows:

No arrangement shall be made under section 3, no contract shall be made or continued in effect under section 4, and no license shall be issued under section

4 (e) or 7 unless the person with whom such arrangement is made, the contractor, or prospective contractor, or the prospective licensee, agrees in writing not to permit any individual to have access to restricted data until the Federal Bureau of Investigation shall have made an investigation and report to the Commission on the character, associations, and loyalty of such individual, and the Commission shall have determined that permitting such person to have access to restricted data will not endanger the common defense or security.

That is the end of that particular section; that applies to contractor employees.

Now, the next succeeding section, which applies to employees of the Commission strictly—these encompass the some 5,000 employees that the Commission hires directly—that next succeeding section is as follows:

Except as authorized by the Commission in case of emergency—

I call attention to the fact that the word “case” is singular and not plural—

Except as authorized by the Commission in case of emergency, no individual shall be employed by the Commission until the Federal Bureau of Investigation shall have made an investigation and report to the Commission on the character, associations, and loyalty of such individual.

That is the end of that section.

Now, Mr. Chairman, I have here the report of emergency clearances for April 1949, which was just reported to the joint committee a day or two ago, within the last 2 or 3 days. It shows that the total number of emergency clearances granted in April was 140. The number of emergency clearances granted in April, with access to restricted data, is 140.

In running through this, at the moment I will say, if you will give me just a moment that 21 of those 140 are Atomic Energy Commission employees, that is, employed directly by the Commission. The balance of the 140 are contractor employees.

Mr. Chairman, according to the arrangements the other day, I shall not ask to have the names of the employees nor the locations put into the public record, but there is a summary sheet on the top of this report which merely summarizes the number and the location—the number at each location—and I will ask to have that go into the record at this point.

The CHAIRMAN. So ordered.

(The report above referred to is as follows:)

*U. S. Atomic Energy Commission—Summary report of emergency clearances granted, April 1949*

	Emergency clearances	Access to restricted data	
		With	Without
1. Chicago.....	29	29	0
2. Hanford.....	4	4	0
3. New York.....	9	9	0
4. Oak Ridge.....	85	85	0
5. Project Royal.....	1	1	0
6. Sandia.....	1	1	0
7. Santa Fe.....	3	3	0
8. Washington.....	8	8	0
Total.....	140	140	0

All emergency clearances listed were granted by the Managers of Operations under authority of GM-Bulletin 101. For the purposes of this report an emergency clearance is defined as follows: (a) clearance of any direct employee of AEC with or without access to "restricted data"; and (b) clearance of any contractor's employee, prospective contractor, consultant, or employee of any other Government agency, with access to "restricted data" prior to full FBI investigation. Emergency clearances are granted only after the duties for the job for which emergency clearance is requested have been specified and the clearance specifically states that access is granted only to information required in the performance of these duties. Clearances under the interim security measures for the armed forces, issued May 23, 1947, are not included.

Senator HICKENLOOPER. Now, Mr. Chairman, as you know, and it was announced, the procedure that I intended to follow has been held in abeyance pending the committee decision on the procedure or method of procedure in connection with security files which I intend to go into.

Of course, I am biding my time when the committee will make its decision on that matter, and I believe we are agreed that it will be made very shortly.

The CHAIRMAN. Yes.

**STATEMENT OF DAVID E. LILIENTHAL, CHAIRMAN, ATOMIC ENERGY COMMISSION; ACCOMPANIED BY CARROLL L. WILSON, GENERAL MANAGER, AND JOSEPH VOLPE, JR., GENERAL COUNSEL, ATOMIC ENERGY COMMISSION; AND CHARLES KENNETH WEIDNER, CHIEF ENGINEER, SPECIAL CONSTRUCTION ACCOUNT, UNIVERSITY OF CHICAGO**

Mr. LILIENTHAL. Mr. Chairman, may I ask a question of the chairman at this point?

The CHAIRMAN. Yes, sir.

Mr. LILIENTHAL. Does this pending decision include the Commission's formal request for a hearing, a public hearing in the case of the individual identified the other day, or was that a separate decision?

The CHAIRMAN. That is one of the things to be deliberated upon.

Senator HICKENLOOPER. In that connection, Mr. Chairman, may I ask Mr. Lilienthal a question?

Mr. Lilienthal, I believe you wrote Chairman McMahon a letter, did you not, about that?

Mr. LILIENTHAL. Yes, sir.

Senator HICKENLOOPER. Which he received, I believe, the day before yesterday evening, Monday evening?

Mr. LILIENTHAL. The Commission did write a letter; yes.

Senator HICKENLOOPER. Yes. That letter, do you intend that that letter should be made public?

Mr. LILIENTHAL. We certainly want the committee to dispose of it in any way it chooses. Our preference would be that it should be made public.

Senator HICKENLOOPER. Well, it makes no difference to me one way or the other. I happen to disagree with several things stated in the letter, and I did not want to publicly disagree with it. If you care to have the letter remain private, I would do it in executive session, but if it is made public, then I would govern my disagreement accordingly.

Mr. LILIENTHAL. Our strong preference about that whole matter is that it should be public in every respect, and this would include the letter. Of course, the committee is the recipient of the letter, and will have to decide that.

The CHAIRMAN. Of course, Mr. Lilienthal, you have made it impossible almost for me to keep it now as an executive matter in committee, because here in the presence of all the press you have stated that you would desire to have it published. I can assure you that they would make life miserable for me until it is published.

But I agree that there is no reason why it should not be made public.

Mr. LILIENTHAL. It is an unclassified letter, perhaps I should say that. That still does not decide the question of its publication.

Senator HICKENLOOPER. Well, Mr. Chairman, the letter of Chairman Lilienthal is addressed to you, and I would not undertake the responsibility of publicly commenting on it until such time as whoever has it or has control over the letter—

The CHAIRMAN. Do not misunderstand me. I have no criticism of the fact that the letter should be made public. I see no reason why it should not be.

Is it your desire that it be read into the record at this time?

Mr. LILIENTHAL. From our point of view that would be desirable, but—

The CHAIRMAN. I will tell you, suppose we delay this matter for just a moment until we get into some other matters with Senator Hickenlooper, and unless we take the letter up publicly today, I shall make it public at the end of the session.

Senator HICKENLOOPER. Now, Mr. Chairman, I want to revert to the famous case A of last Monday, just to make the record complete. For those members of the committee who feel that I might stray a little from our understanding, I say that the chairman knows exactly what I am referring to, and I believe he sees no harm in my proceeding along this line.

The CHAIRMAN. No objection at all.

Senator HICKENLOOPER. Last Monday I called attention in case A to the fact that a security review board had been established, and had heard case A under the terms of the statute touching character, associations and loyalty of a subject.

I stated that a board of three people had been appointed, I believe, by the Deputy General Manager from Commission employees, one of whom, I think, had just left the Commission a week or so before that, but they were three Commission employees. One was a lawyer, two were scientists.

I also made the statement that in my opinion this board was not adequate to pass upon the questions, all of the questions involved in the categories because of a complete lack of experience or background, not because they are not intelligent gentlemen in their own fields; they were out of their fields.

Now, I would like to put into the record a colloquy that went on a few days ago in the hearings before the subcommittee of the Committee on Appropriations of the Senate in connection with the Independent Offices appropriation bill.

Senator O'Mahoney, who is chairman of that subcommittee, asked this question:

Senator O'MAHONEY. I understood from your testimony yesterday that the Atomic Energy Commission sought to dissociate itself from the selection of fellows, in order to avoid bureaucratic interference in the selection of the fellows, and turned that over to the National Research Council.

Senator BRIDGES. Dr. Warren, did you have any knowledge of this?

Dr. WARREN. There are certain individuals here with whom I am acquainted and with whose work I am acquainted. I have reviewed all of these appointments and have attempted to evaluate the value of the work proposed for the atomic energy program in the broader sense.

Senator BRIDGES. Have you passed on their Communist backgrounds or affiliations?

Dr. WARREN. I have not, sir. I am not competent in that field.

Dr. Warren was one of the members of the board who sat to pass upon the questions involved in the clearance of case A. That ends my reference to case A at the moment, Mr. Chairman.

Mr. LILIENTHAL. Mr. Chairman, I assume that later this morning there will be an opportunity to respond to this comment.

The CHAIRMAN. This particular comment?

Mr. LILIENTHAL. Yes.

The CHAIRMAN. You can respond now.

Mr. LILIENTHAL. I would like to say that the apprehensions and fears that we expressed about the dangers of smearing people by innuendo that would arise out of the discussions of these confidential files in these hearings, without having a full hearing on the business, are being confirmed almost daily by what is transpiring.

Whatever the motives—and only God knows a man's motives—the inferences that have been drawn as a result of the statements in respect to Mr. A, drawn widely, are that this individual is an actual security risk. A reading of this file, which was in the hands of the joint committee and its staff for a period of 8 months, discloses that had the whole file, and not one-eighth of the file, been before the committee in executive session—or as I hope later will be disclosed in full public hearing—you would find that an individual, who made highly unfavorable statements in respect to this man, after an anonymous letter had been written, stated flatly, before a board and under oath, in response to repeated questions, that he had no basis in fact whatsoever for the charges that he had made.

This discloses, in our opinion, the great importance of an early public hearing on this man, not only as a matter of justice to this individual, but because there is something even greater than that involved, and that is the integrity and the continuity and morale in this very important enterprise.

In respect to the comments about this board itself, it consisted of three individuals whose backgrounds I should like to simply put into the record.

The assumption that only an intelligence officer or an individual with that background has judgment about people is, I think, fallacious. It is well known that physicians and lawyers frequently have as good, and I would say often better, judgment about people and their character, and better ability to judge people than do intelligence officers and security officers, and this will be indicated by the characteristics of the individuals on this local board.

There is a good deal more to be said on this subject, but I would just like at this point to repeat the importance of an early full discussion of this case as an example, Mr. Chairman, for the country to see, for the committee itself is familiar with the file, that grave injustices to a great many people and the growth of fear and apprehension can destroy this program if we do not in a public hearing expose the dangers of unsupported charges and a trial of individuals by particulars rather than in toto.

This has already happened all through the country in the atomic energy program as a result of this one incident.

It is the desire of the committee, and it has been the consistent desire of the committee, to prevent that sort of thing happening.

The CHAIRMAN. Do you see any difficulties to the security system and the arrangements that have existed heretofore with the joint committee in a full exposition of even one case?

Mr. LILIENTHAL. Well, I think—perhaps I do not understand the chairman's comment—

The CHAIRMAN. Let me repeat—

Mr. LILIENTHAL (continuing). The chairman's question.

The CHAIRMAN. Do you see any difficulties or any dangers to the functioning of this joint committee in the way it has been functioning heretofore in the full exposition of even this one case?

Mr. LILIENTHAL. In a public hearing?

The CHAIRMAN. That is right.

Mr. LILIENTHAL. Well, it is regrettable, of course, that this individual was identified, and that a partial statement about him, implying that he is a security risk, putting a cloud on the whole enterprise, has occurred, but having occurred, I think there will be great advantage to the efforts of the Commission to develop morale among its employees, and great advantage to the country as well as to the committee in following through the procedures in this case, to show how careful they have been and also to show the difference between charge and proof.

Therefore, my answer would be, that I would think it—the facts being as they are presently, the facts being that we have departed from the earlier procedures that the committee has successfully followed in discussing these matters only in executive session and with the full file before them—under the circumstances we now find, I would think it to be to the advantage of the atomic energy enterprise and of this investigation, that we proceed to a full hearing in this individual case.

The CHAIRMAN. Now, of course, your files are, in part, based upon FBI investigations. I assume you would not want those placed in the file and in the record of an open hearing?

Mr. LILIENTHAL. Well, the charges have been made in open hearing. I am somewhat—I think a great many people would be—stumped by the proposition of not being able to respond in open hearing to these public charges by stating that the materials in the files are secret. That is something that should have been thought of before this individual, before this matter was brought up in public hearing, but since it has been brought up I see no alternative to a full divulging of the contents of this file in some way. Otherwise I see no security at all for the good name of anyone in the atomic energy enterprise if this sort of thing can be repeated.

Senator KNOWLAND. Mr. Chairman, just at that point, if I might ask Mr. Lilienthal a question?

The CHAIRMAN. Yes.

Senator KNOWLAND. You are not here to make a statement, are you, that of your vast number of employees, that the overwhelming number of them have a security file of the size and substance of case A? I do not think you would want that impression to go out either to this committee or to the country, so that when you say it would cast reflection on all the members or all those in the atomic energy work, I am sure you would want to make clear that that is not so, that there is not a similar type of a file on every individual, and it is a very infinitesimally small number that might have a file of that size.

Mr. LILIENTHAL. No, Senator Knowland; I do not want to be taken to imply that, but I do say that if it is possible simply by raising one's voice in public, casting a suspicion upon individuals, not to have one dispose of that suspicion in some public way, to meet a charge with proof, then we are in a bad way indeed because in this particular case, Senator, the information in this file which followed a full FBI investigation, disclosed nothing of any character unfavorable to this individual.

Later an anonymous letter was received on the basis of which we requested a further FBI investigation. The further FBI investigation did produce the statements which were derogatory.

When this individual was confronted with his statements, but under oath, he stated that he had no basis in fact whatever to support the statement.

I simply say to you, Senator, that this is a prime example for every member on this committee who feels as you do, and as all the rest of you feel about the importance of protecting people, by procedures, against this sort of situation; this sort of thing could happen to anyone, because anyone having been cleared could, by some malicious individual or some loose-mouthed individual, some man with whom he had had a dispute or someone who was just out to cause trouble, could have such a charge made anonymously, and find himself in a position where he could not have a chance to confront his accuser, as was done in the case of this local board, so no one is secure.

Senator KNOWLAND. But does it not also show, Mr. Lilienthal, the responsibilities on the part of the Commission itself for getting clearances in advance so that the Commission itself will not put anybody in an embarrassing position by giving them access to top-secret information of a nature which might later, due to investigations or otherwise, embarrass him? In other words, there is also a responsibility on the part of the Commission itself to be doubly sure that there is no chance of security violation.

Mr. LILIENTHAL. Senator Knowland, you are exactly correct, and that is why this case in itself will be so illuminating in that respect, because here was an individual who did not have access to restricted data until a full FBI investigation and report had been received. The report, of course, was not evaluated. There was a general misapprehension on that score, but the report was received and clearance was made before he had access to restricted data. It is true that he received an emergency clearance, but he did not report to work, he did not have access to restricted data until the full FBI report was received, and his clearance was given.

Subsequent to that event, this could have happened in the case of any individual, months subsequent, subsequent to his clearance on the basis of a full FBI report, this anonymous letter was received.

My point, Senator, is that here the procedure was followed with care. In the case of anyone who has been cleared, not only in the Atomic Energy Commission, but anywhere, who has been cleared for access to restricted data, following a full report, such an episode as this of a man who is making statements which he is not prepared to support, unable to support, this could happen to anyone, so that the precautions that you have suggested should be taken, I agree with you heartily; but after those precautions are taken, this sort of thing can happen, and if we do not have this record spread before the country, I do not see how we can possibly expect people to have any sense of security against malicious individuals writing anonymous letters and setting off a train of events.

Senator KNOWLAND. Just one more question, Mr. Chairman.

I would just like to get the record straight. You have referred to case A, and I do not intend to go into that particular case, wherein you said that there was no security information, classified information, made available after a check. But you do not mean to say, do you, Mr. Lilienthal, that that is true in all cases where emergency clearances have been given, that the people are not given access—that security information is not made available to them?

Mr. LILIENTHAL. No.

Senator KNOWLAND. There are many instances where emergency clearances are given, and they do have access to classified information, and it is some time later before the FBI check is made. Is that not correct?

Mr. LILIENTHAL. The FBI check is made before, but the full investigational report is not received; yes, sir.

Senator HICKENLOOPER. Mr. Chairman, I merely want to suggest to the committee that in my judgment Mr. Lilienthal has revealed more information, or stated his opinion of more information inside this file than has yet been brought out. In fact, it is rather surprising, but I just want to say this to the committee, because I am not going to discuss case A any longer, that is, in detail at all; I want to say to the committee that the committee will note that Mr. Lilienthal said that this matter arose on the statement of one individual who later had admitted, there said, that he had no foundation for it.

I made the statement the other day that it was information developed from literally dozens of individuals in the file, and whether or not the file is in that way or the way Mr. Lilienthal says, I will, of course, leave to the judgment of the committee, all of whom here, I believe practically all, have seen the file, and have gone through it. Now, that is up to the committee which may decide that. I do not care to discuss that any further at this time.

Mr. LILIENTHAL. Mr. Chairman, may I say something?

Mr. PRICE. Mr. Chairman, then it is evident that a cloud had been placed over the situation, and Mr. Lilienthal's suggestion is that we remove the cloud. The only way we can do it is in open public hearing.

The CHAIRMAN. Well, suppose we defer further discussion on that as we agreed to do until we have our next executive meeting.

Mr. JACKSON. Mr. Chairman, may I reiterate what I said the other day at the last meeting, namely, that time is of the essence in this

matter, and I hope that the committee will go into case A in all of its details, including the individual involved, if he desires to appear, without delay.

I have before me copies of headlines from three newspapers which, I think, as far as the public interest is concerned, demonstrate the need that all facts be given.

Here is the New York Times, which says, "Atom Aide Under FBI Cloud; Had Data on Hottest Secret." That is one headline, the New York Times.

Here is the Washington Star, "Loyalty Suspect Declared Author of Atom Reports."

Here is the New York Mirror, "Charge Atom Aide Got Job Back Despite FBI."

Now, the only inference that can be drawn from that type of information in the public press is that this particular individual, as far as his loyalty is concerned, has a cloud over him, and I think that the public interest demands that all relevant evidence in connection with that case be presented in public.

I again reiterate the previous request.

The CHAIRMAN. Mr. Lilienthal, you have an observation?

Mr. LILIENTHAL. Yes, in two parts: One is the statement I made this morning which was that there was an anonymous letter from a single individual. I did not say that only a single individual was involved in the further investigation.

The second is that Senator Hickenlooper in his statements the other day made statements of fact about the trial before the local board and in other respects, which we do not believe are borne out by the record itself, the record of some 350 pages of testimony, and other parts of this record.

This again illustrates, it seems to us, the contradiction to the ordinary principles of fair play by which we set so much store in this country, and by which this committee has set such store, and which would require that the full statement of the situation here, rather than those selections, and, with all respect, what we believe to be inaccuracies which, of course, under the public hearing situation, condemn this man, and condemn the system, and raise a cloud about the entire enterprise until resolved.

The CHAIRMAN. I take it that your request is made on the basis of case A, and does not include B, C, D, and E, and so on?

Mr. LILIENTHAL. I have not had an opportunity to consult with my colleagues on this. My personal view would be that if we are going to go into these individual cases, and if the samples, if the examples we have had in the past of identification by inference continues, as I think we have reason to believe that they will, we ought to go into the entire record of all the individuals whose names have been submitted on this list.

The CHAIRMAN. Well, that is assuming that some public mention is made at a committee meeting in the nature of a syllabus.

Mr. LILIENTHAL. That is right. If things comparable in respect to case A transpire, then it would seem to be necessary from our viewpoint—

The CHAIRMAN. If I understand you correctly in your letter, if a syllabus of the case were not given publicly, it would be your prefer-

ence that the case be examined in executive session because of the fact that confidential files would be opened for general inspection, which would be contrary to good sound public policy.

Mr. LILIENTHAL. Senator McMahon, I believe our position is this: There is one of two ways of handling this problem. One is as the committee has handled it in the past, in executive session; there is a lot of tradition back of that, as well, and there is the precedent of the President's order in respect to confidential files. There is another way to handle it, and that is in public hearing. If it is held in public hearing, we believe the hearing should be public in extenso, with all the facts, and not a selection of the facts being made available, and there is really no middle ground.

Senator MILLIKIN. Mr. Chairman, may I suggest that the problem is exactly the same whether you have it in committee or whether you have it here in the open. If we have it in committee any facts that would be essential in public should be essential there, and the inquiry should be pursued in the same way.

Mr. LILIENTHAL. That is right.

Senator MILLIKIN. There is no difference at all between procedures if we are to have a thorough investigation.

Mr. LILIENTHAL. The difference only being whether it is an executive session or public session.

Senator MILLIKIN. The only difference is whether you want to keep from the public that which you develop in private; that is the difference.

Mr. LILIENTHAL. Our position is that we want the public to have the whole story if there is to be any public presentation at all.

Senator MILLIKIN. Mr. Chairman, I would like to ask Mr. Lilienthal one question: With reference to case A, did the Security Board which you set up to judge the subject of case A take testimony from all witnesses disclosed by the record?

Mr. LILIENTHAL. All of the witnesses disclosed in the record were invited and urged to attend.

Senator MILLIKIN. Did it take testimony from all of them?

Mr. LILIENTHAL. It did not, because a number declined to appear.

Senator MILLIKIN. You gave an opportunity to all witnesses to appear?

Mr. LILIENTHAL. It was more than that.

Senator MILLIKIN. Whose names were suggested in the record?

Mr. LILIENTHAL. Yes, Senator; and more than that, they were urged to attend.

Senator MILLIKIN. Yes.

(The following letters were submitted later for the record:)

UNITED STATES ATOMIC ENERGY COMMISSION,  
Washington, June 10, 1949.

HON. BRIEN C. MCMAHON,  
Chairman, Joint Committee on Atomic Energy,  
Senate Office Building, Washington 25, D. C.

DEAR SENATOR MCMAHON: Attached is a copy of the letter I have sent to Senator Millikin concerning my response to one of his questions regarding case A. I should appreciate it if this letter were made part of the record.

DAVID E. LILIENTHAL, *Chairman.*

JUNE 10, 1949.

HON. EUGENE D. MILLIKIN,

*United States Senate, Washington 25, D. C.*

DEAR SENATOR MILLIKIN: On Wednesday in reply to one of your questions concerning case A, I indicated that the local board had invited to appear before it all the persons who had furnished statements to the Federal Bureau of Investigation concerning Mr. A.

I was speaking then from recollection and find on checking the record of the case that the local board requested through the Federal Bureau of Investigation the appearance of the four persons who had made the principal statements unfavorable to Mr. A. Three of these persons did testify voluntarily. The fourth indicated to the Federal Bureau of Investigation that he did not wish to appear.

Sincerely yours,

DAVID E. LILIENTHAL, *Chairman.*

The CHAIRMAN. Now, if there are no further observations or comments about case A, and the problems which case A has given birth to, we will proceed to something else.

Senator Hickenlooper?

Senator HICKENLOOPER. Mr. Chairman, we have talked a great deal about personnel clearance procedures. They have been frequently mentioned, and we have talked about decentralization, of changes in plan in the Commission, and I have brought for the information of the committee this morning a most peculiar and remarkable document.

I have here, Mr. Chairman, and hold it where the committee can see it—let the committee get a look at it. I have here, Mr. Chairman, what is known as Personnel Clearance Procedure. First Phase Decentralization. This was developed by cartographers, I understand, from the Coast and Geodetic Survey, and it purports to outline the security clearance procedure of an applicant for a job.

Now, I have traced, begun up here where the individual is supposed to come in.

Now, just let me read a few things here.

Mr. COLE. Mr. Chairman, may I inquire: Is this chart one that was prepared at the request of the Senator from Iowa or is it a Commission—

Senator HICKENLOOPER. This is a Commission chart. Incidentally, the man who had charge of this, I am told, and personnel situations of this kind, had been a ship's damage-control officer in the Navy, and came from there to the Commission, and I do not know whether he thought he was dealing with a battleship or just what, in this chart.

Mr. PRICE. On whose recommendation was it prepared, Mr. Chairman?

Senator HICKENLOOPER. The Commission's recommendation.

Mr. PRICE. Do you mean Mr. Lilienthal or the Commission?

Senator HICKENLOOPER. Just the Commission's recommendation.

Mr. PRICE. I thought that you had directed your charges against the Chairman of the Commission.

Senator HICKENLOOPER. Well, you may think that or whatever you please.

Mr. PRICE. You said that at the opening hearing here.

Senator HICKENLOOPER. May I go on?

Mr. PRICE. Certainly, go on.

Senator HICKENLOOPER. May I go on with the presentation of this case? This gets a little beyond the individual situation.

A man comes in—I do not know whether he comes in or goes out. He is supposed to start here.

Senator KNOWLAND. It looks like a Rube Goldberg cartoon.

Senator HICKENLOOPER. There is a path that goes up here—here is a path that goes up here, and then an arrow goes out here into infinity; I do not know what that is, but anyway it starts out this way, "Assign case number and fill out in full (1)." Now, 1 is the master reference index card. "Fill out in full (1) to (9)," so you fill out the master reference index card down to control index card—"in the quantities indicated."

Then, the next step is "With flap of file folder (4) on the right-hand side and with folder open, staple (1) (5)"—that is the master index card, and (5) is the file summary sheet—"staple to the left-hand side and (1) (6) to the right-hand side."

Now, I do not know how you can staple one to the left-hand side and also staple one to the right-hand side. That is what the chart says.

"The combination of 4, 5, and 6 becomes (11)." That becomes the file folder in process.

Then, apparently this thing starts down into this highly complicated situation. This goes—wait a minute, I do not know where it goes. It goes out here four or five times, and then it comes down into here.

The fact is that this chart of the "First Phase Decentralization" of security—

Senator KNOWLAND. Is there another phase?

Senator HICKENLOOPER. Yes; there is.

This is the first phase I have gone through here, and finally there is an arrow that goes off here in sort of a detached way, and this says "Notice of action from personnel or other source," and that is that.

Now, I frankly have studied this a long time, and I cannot find my way through this maze. I think it might be well to have it printed as a puzzle and give you a prize if you can follow around and come to the end.

There is quite a system of what looks like a railroad switchyard down in here.

Now, this is the first sheet of the first phase decentralization of security clearance.

Here is phase 2, or the second sheet; this is the second sheet of the first phase of decentralization. Can the committee see this?

It is a remarkable thing. Instead of coming in up here some place it comes in down here in the middle, and goes on around through, I guess, because I have tried to follow these things through, and the significant thing about it is that in attempting to follow this remarkable pattern in the clearance procedures of personnel, I can find two or three places where if there is nothing wrong with an individual or no suspicion or no charges, he can be cleared if he is as clear as can be, and there is no question about him; there are two or three places that he can be cleared.

But if there is derogatory information, if there is doubt raised, I cannot find any place there where the fellow lights or roosts.

Mr. Chairman, it is a remarkable thing. I have tried it, and the best I can give you is that there are involved, as nearly as I can tell, 113

operations and they go into some, they ramify into some 20 or 23 offices before this fellow who is trying to get cleared gets off, if he ever gets off the second sheet; and I understand that sheet 3 was not finished. I do not know what happened to that cartographer who built it up, but I just use that this morning as an illustration of the confusion in this personnel clearance situation. I think that is plainly shown.

Now, these charts were prepared, and are quite expensive. They are prepared and produced by cartographers, printed by the United States Coast and Geodetic Survey. They are in three colors—in fact, they are in four colors—no, five colors. They are in green, in blue, in red, a sort of orange—let me see—I get lost every time I start looking at this thing, so you will have to excuse me. There is green, there is blue, there is orange, there is red, there is black, and that makes five, does it not?

Mr. COLE. Do not forget the white.

Senator HICKENLOOPER. Well, it is on white. [Laughter.] I have introduced those, and I would be glad to put those into the record, Mr. Chairman, if they can be introduced.

The CHAIRMAN. I do not think this can be reproduced in any record which we would be capable of making.

Senator HICKENLOOPER. I thought they might photograph it, which would be the only way to get it.

The CHAIRMAN. We will take up the mechanics of the problem, but they seem to me to be very great indeed.

(The charts referred to above entitled "Personnel Clearance Procedure, First Phase Decentralization," and "Procedure for Screening Cases, First Phase Decentralization," prepared by the Personnel Security Branch, Office of Security and Intelligence, Atomic Energy Commission, are filed with the Joint Committee on Atomic Energy and made part of the record of this hearing by reference.)

Senator MILLIKIN. Mr. Chairman, I would like to suggest that Senator Hickenlooper has rendered a disservice to his case because if any applicant got caught in that maze, he would never be cleared, and since no one is ever cleared, there is complete security. [Laughter.]

Senator HICKENLOOPER. I do make the point seriously that there are points in the first chart where if a man has not sufficient derogatory information to raise a question about him, he can be cleared. Of course, that could be an utterly simple thing. He applies, his record is clear on investigation, and he is cleared; but it is the fellow where doubt is raised who gets to wandering around there, and you may have something, I do not know.

I would be happy, Mr. Chairman, I do not know if anybody here can trace the operation through, I do not want to leave it, or I will just leave it as it is, whatever you think about it.

The CHAIRMAN. Is there any comment from the Commission on this subject? Is there any defense or offense?

Mr. LILIENTHAL. Well, there is the first incredible thing that I have heard in these hearings, but we have procedures which are described in print, and someone apparently has translated them into charts. Mr. Wilson might describe those procedures, if the committee desires to have them.

This has been done before, and is in your files. It just depends on how much time you want to put in on this.

Mr. WILSON. Mr. Chairman, I would like to submit a copy of GM-80 which is the basic delegation of authority in respect to the granting of clearances, both to the Director of Security and the Managers of Operations; that is about a page and a half, which I think spells out the basic procedure.

I should say that the particular chart or charts to which Senator Hickenlooper has referred represented an attempt where Admiral Gingrich felt this could be expressed in terms of flow charts, of flow sheets, and this was an attempt to do so.

How much it has been used, I am not in a position to say, but—  
 Senator HICKENLOOPER. May I just say that the naval officer to whom I referred, who had been a ship's damage control officer, was not Admiral Gingrich.

Mr. WILSON. No, but he was conducting this under Admiral Gingrich's general direction, I believe.

Mr. DURHAM. Was it made at his request, the security officer's request?

Mr. WILSON. They were made at his request.

Mr. JACKSON. Mr. Wilson, I wonder if you could give some of the other background of this individual. I assume he happened to be an officer during the war, which is no particular count against him. Could you tell us something else about his background?

Mr. WILSON. His general background?

Mr. JACKSON. Yes.

Mr. WILSON. I cannot tell you about it. He was brought in to do this job under Admiral Gingrich's direction. Admiral Gingrich had known him, I believe, and he had performed earlier work for him.

As I say, the attempt to reduce this to a flow chart—

Mr. JACKSON. Was he a Regular Navy officer?

Mr. WILSON. I believe he is a Regular Navy officer.

Mr. PRICE. Assigned to the Commission?

Mr. WILSON. The Coast and Geodetic Survey undertook this job for the Commission. Some of the people engaged in it actually worked in the Division of Security while these charts were being prepared. It was at the same time that they were also preparing for us maps of the various facilities indicating the different exclusion areas, and the like.

I might say that a good deal of the system—I do not claim that this represents or reflects the system—but I do believe that the system is functioning, and functioning well, and it involves handling about 70,000 individual cases per year, cases arising at any one of dozens of locations, and feeding into the various offices of operations, where the material is checked; the material is forwarded from there to the FBI, together with master control cards for the Washington headquarters. Completed reports are returned by the FBI to the originating office. They are then screened once, twice. Some 75 percent of all cases show up no derogatory information of any kind. Those go through fairly promptly. Others in which there is any derogatory information are screened again, and out of this there is an evaluation of the character of it.

Out of this total about 3 percent of all these 70,000 cases a year reveal what is called substantial derogatory information in the form of allegations, charges, and the like.

Senator HICKENLOOPER. Mr. Chairman, may I just suggest to Mr. Wilson he has emphasized the fact that there are 70,000 cases a year; I may be underestimating the turn-over, because there are about 50,000 contractor employees, and about 5,000 Commission employees; that makes about 55,000, so if they are processing 70,000 a year, maybe my turn-over percentage should be increased to well over a hundred percent.

Mr. WILSON. I believe, Senator, we submitted the figures on the turn-over in construction jobs, as I pointed out the other day, and there is a high turn-over. This is characteristic of construction jobs.

I believe that the written instructions which are basically contained in General Manager Bulletin 80 describe the authority and responsibilities and general procedures and they are supplemented by more extensive regulations which can be submitted for the record.

The CHAIRMAN. I wish you would submit that for the record, Mr. Wilson. I think we are familiar with the printed clearance procedures.

(The document referred to follows:)

#### ATOMIC ENERGY COMMISSION

Bulletin  
GM-80

Security and Intelligence  
Personnel Clearances

#### DECENTRALIZATION OF AUTHORITY TO GRANT PERSONNEL CLEARANCES AND OF CONTROL OF INVESTIGATIVE REPORTS

Ref: Amends General Manager's letter of February 14, 1947, subject: Personnel Clearance. Temporary security clearance for emergency appointments, clearances and approvals of aliens, and clearances and approvals for personnel of the Military Establishment are not covered by this bulletin.

For: Managers of Operations.

##### 1. Delegation of authority

(a) Effective April 15, 1948, Managers of Operations are authorized to receive on behalf of the Commission reports from the Federal Bureau of Investigation concerning the character, associations, and loyalty of individuals employed by the Commission or considered for such employment, or permitted by contractors or licensees to have access to restricted data or proposed to have such access; and to determine on behalf of the Commission that employing such persons or permitting them to have access to restricted data will not endanger the common defense or security and to grant security clearance therefor, *provided*: That the complete report by the Federal Bureau of Information shall not have disclosed any substantially derogatory information concerning the character, associations, or loyalty of such persons. If any such substantially derogatory information shall have been disclosed, the complete FBI report, together with other pertinent information, shall be forwarded to the Office of Security and Intelligence, Washington, D. C., for determination as to whether there is security risk.

(b) The authority to grant security clearance in cases where no derogatory information is disclosed may be redelegated in writing to such assistants as the Manager may deem necessary; the authority to grant security clearance in cases where derogatory information is disclosed, but is not considered to be substantially derogatory, may be redelegated in writing to area Managers, without power of further redelegation.

(c) For the purposes of this bulletin, the Assistant General Manager will act as Manager of Operations in the Washington area, and Washington area security operations will perform the functions assigned to local security offices.

##### 2. Allocation of responsibility

(a) Managers of Operations will designate the local security offices which are to assume the responsibilities and may delegate to the appropriate area Managers or other officials authority for granting the personnel security clearances, subject

to the limitations of paragraph 1 (b) above and exhibits I and II. Arrangements may be made between the respective Offices of Operations for the allocation of these responsibilities to one as an administrative service for the other, where the location of a facility is such as to justify such arrangement as a matter of expediency.

(b) TEC headquarters: The Office of Security and Intelligence will transmit to the designated local security offices investigative reports received from the FBI; receive and coordinate with the FBI all requests from the field relating to the procedure for processing of investigations; provide detailed information as to the subversive characteristics of organizations, upon request; and make the analysis, review, and security decision on all cases requiring decision and instruction by AEC headquarters.

### 3. Procedural guides

There are attached as exhibits I, II, III, and IV, the basic procedural requirements for processing personnel clearance actions under the new authority, and for furnishing statistical reports to Washington.

CARROLL L. WILSON,  
*General Manager.*

Revised June 17, 1948.

#### TRANSMITTAL NOTICE

Bulletin  
GM-80

Security and Intelligence  
Personnel Clearances

(Revised June 17, 1948)

Subparagraph (c) has been added to paragraph 1 on page 1 to delegate to the Assistant General Manager the same authority to grant personnel clearances for the Washington area as is delegated to the Managers of Operations for their respective areas of jurisdiction.

(Regulations supplementing the above regulation are marked "Exhibit 9" and will be found in the appendix.)

Mr. JACKSON. I would like to have the background of this employee who prepared the chart placed in the record.

Mr. WILSON. I will be glad to.

Senator HICKENLOOPER. Mr. Chairman, please do not misunderstand me. I am casting no aspersions on the employee who made the chart. My suggestion which I probably feebly made was that he had been a ship's damage-control officer, and I thought, perhaps, that this looked like a ship's damage-control chart in its complications. The officer is undoubtedly an able gentleman, and an able officer.

I was not casting any reflection on him as an individual, and I am perfectly willing to concede that he is a very high-class fellow.

Mr. JACKSON. I gathered—maybe I drew the wrong inferences—but it seemed to me that it was a question as to whether a damage-control officer was qualified to do this job. I do not see any harm in putting his occupational background and biographical sketch into the record.

The CHAIRMAN. Well, without objection it will be so ordered.

(The biographical sketch referred to is as follows:)

UNITED STATES ATOMIC ENERGY COMMISSION,  
*Washington 25, D. C., June 21, 1949.*

Mr. WILLIAM L. BORDEN,  
*Executive Director, Joint Committee on Atomic Energy, Washington, D. C.*

DEAR MR. BORDEN: At the hearing before the joint committee on June 8, Mr. Jackson suggested putting into the record a biographical sketch of the AEC employee who prepared the security-flow chart presented for the record by Senator Hickenlooper.

Accordingly, a sketch on this individual is submitted herewith:

This employee was employed on the floor of the New York Stock Exchange from 1929 to 1934. During the latter years of this period he attended Columbia

University and City College of New York, where he majored in business administration and mathematics. He was then engaged as a salesman by A. Stanley Brussel until 1938, when he started his own business for the sale, design, and distribution of metal and ceramic housewares. From this position he went to the Frankel Machinery Corp. in 1942, where he supervised the new engineering design and assembly of turret lathes. In June 1944 he joined the Consolidated Machine & Design Co., of New York, where he supervised drafting and graphic presentation, sales and field operations of all phases of mechanical design.

He entered the United States Army in June 1944 as a private. In August 1944 an application for a commission in the Navy made prior to his Army induction was approved, and he then entered the United States Navy, where he was appointed lieutenant (junior grade), with a classification of aviation volunteer specialist. On April 1, 1946, he was appointed lieutenant with a classification of aviation limited.

While with the United States Navy, he served from August 1944 to February 1945 as project engineer, Special Devices Division, BuAir, Washington, D. C.; served from February to August 1945 as project engineer, Maintenance Unit, Special Devices Department, Office of Research and Inventions, New York. During the period January 1945 to March 1946 he was given the temporary additional duties of BuShips representative in connection with the preparation of isometric diagrams of damage control systems of the several naval shipyards. He was separated from the service on April 15, 1946.

He then became associated with MacDonald Bros., industrial engineers, in New York City, as district manager, from March to September 1947.

He joined the Atomic Energy Commission as Assistant Chief, Inspection and Survey Board, Division of Security, on October 17, 1947, where he was responsible for initiating and completing of research and physical lay-out engineering study designed to reflect the physical security requirements of principal AEC installations and facilities. He left this position on November 19, 1948, to reenter private industry. He is currently serving AEC as a consultant in connection with security-mapping projects and other security functions as required.

This information is noted for insertion in the record of the June 8 transcript.

Sincerely yours,

CARROLL L. WILSON, *General Manager.*

Mr. WILSON. Mr. Chairman, I have in addition to the printed instructions and bulletins, a general description of the development and operation of the Commission's personnel security program which I would be glad to submit for the record. This is an unclassified document.

The CHAIRMAN. Please do so.

Mr. WILSON. All right.

The CHAIRMAN. That has been published, of course, Mr. Wilson?

Mr. WILSON. Well, it is unclassified. In this particular form it has not previously been published.

The CHAIRMAN. All right.

(The document referred to is marked "Exhibit 10," and will be found in the appendix.)

The CHAIRMAN. All right, Senator Hickenlooper.

Senator HICKENLOOPER. I think Senator Knowland spoke to me a minute ago and said he had a matter to take up. I am through with this particular phase. I have another matter later.

The CHAIRMAN. All right.

Senator KNOWLAND. We received from you, Mr. Wilson, under date of June 6, some answers to a query that I had raised in our committee hearings on the same day relative to the Argonne security in site D, and the letter, together with enclosures, should probably be put into the record at this point.

(The material referred to is marked "Exhibit 11" and will be found in the appendix.)

Senator KNOWLAND. Do you have the security people from the Argonne here this morning?

Mr. WILSON. I do, Senator. We also have a map, copies of which we can hand out to the committee, which indicates the areas at site D, and I believe Mr. Borden has copies of these.

Senator KNOWLAND. I think that would be helpful while we try to clear this up.

Mr. WILSON. I think it would. As soon as you have it in your hand, I will briefly describe it and then introduce Mr. Weidner, who is project engineer of the University of Chicago, supervising work of the Austin Co., which is the construction firm engaged in building certain new buildings at the Du Page County site.

As you will see on this map, the east area on the right—

Senator KNOWLAND. Before you start on the east area, just so we can all keep up with the procession here, site D itself, will you explain what site D covers?

Mr. WILSON. Site D is the terminology used in Chicago for identifying the Du Page County site. That is about 3,600 acres in Du Page County, which is the site of new laboratory buildings.

In other words, site A, for example, the Palos Park site; site B, the downtown site in the old brewery; this is a terminology; and site D, in terms of the parlance refers to the total area.

Senator KNOWLAND. On this chart which you have given the committee it shows site D, and there are three different places listed on here. Do you mean that it only includes these three installations, or are there more than three installations at site D?

Mr. WILSON. These are the only installations at present at site D.

Senator KNOWLAND. So that site D includes the east area, the west area, and apparently one disjointed area, whatever you may call it.

Mr. WILSON. That is right. We will come to that.

Senator KNOWLAND. Just directing again your attention to the instructions that I put in the record the other day labeled "Austin Co., Argonne National Laboratory, site D," I think you will agree with me that insofar as the instructions themselves are concerned, they do not differentiate between east area, west area, and the disjointed area, if we may use that term, but presumably, on the face, relate to site D; is that not correct?

Mr. WILSON. There is a possible ambiguity there, Senator. There was no ambiguity in terms of its understanding at Chicago, but we can understand that looked at apart—you will remember this was on the letterhead of the Austin Co. The Austin Co. has cognizance and supervision and responsibility only in respect to the west area.

These instructions went to their watchmen and guards in the west area, both the small area and the big area in the west area. They did not go to anybody in the east area.

Senator KNOWLAND. Now, directing your attention to what you called the west area, at the present time are there any subdivisions within the west area?

Mr. WILSON. In the west area there is the kidney-shaped section which is construction of new buildings.

Senator KNOWLAND. Now, may I ask this: Is the general public admitted—

Mr. WILSON. Yes.

Senator KNOWLAND (continuing). Into the west area without any checking whatever?

Mr. WILSON. There are watchmen and guards around to keep people from falling down holes and keep people from pilfering articles, but there are no fences; a highway runs adjacent to it on two sides; these is no basis or reason for having this a guarded area. There are only watchmen and watchmen after hours particularly to protect against theft of property and people falling down stairways.

Senator KNOWLAND. Insofar as the general public is concerned, any one of us in this room, without security clearance of any kind, could take our car and drive into the west area; is that what I understand?

Mr. WILSON. Drive into any part of this kidney-shaped area.

Senator KNOWLAND. If that is so, why, then, do you find it necessary under these instructions—which, it is true, were on the letterhead of the Austin Co., but also with the subheading “Argonne National Laboratory, Site D”—do you say that “the following persons and their guests will be allowed unlimited access to all areas of the property at all times upon identification of themselves,” if no identification is required of the general public?

Mr. WILSON. Senator, may I ask Mr. Weidner, who is in charge of this project, to answer that?

Senator KNOWLAND. Yes. I think there is some ambiguity.

Mr. WEIDNER. The area, Senator Knowland, that is under general construction, which is labeled here as the kidney-shaped area, has in it several major buildings under construction around which there is a considerable amount of construction material and that sort of thing.

In regard to this memorandum, if I may go back to that, Senator, that was put out on May 10 and was the result of an effort to try to cut down and control the amount of general public access to the area because we were having difficulty from the standpoint of operating it in the standard construction operation.

Senator KNOWLAND. You say it was an effort to cut down. That order or instruction of May 10 was the second to one that had been issued on April 22 of a generally similar nature.

Mr. WEIDNER. That is true.

Senator KNOWLAND. The one on April 22 listed 77 people who would have access with their guests to this area, and the one on May 10 had 154 who would have access with their guests; so you have increased by geometric proportions almost. It hardly seems you were cutting down when you more than double those with access.

Mr. WEIDNER. Perhaps, Senator Knowland, it would be better to go back and start from the beginning.

Senator KNOWLAND. I think it would be better, so we all understand it.

Mr. WEIDNER. Yes, sir. In the first place, everything outside of the east area, from the time it was constructed and turned over to the laboratory as an operating unit, has been treated as a normal Government construction operation because it does not involve at the moment or up to date any restricted construction.

Senator KNOWLAND. Are there no Quonset huts with security information?

Mr. WEIDNER. I will get to that in a moment.

Senator KNOWLAND. You said there was nothing but this construction.

Mr. WEIDNER. I said there was no restricted construction going on. In handling this operation we also must design it. We must design it to fit the needs of the scientific staff within the direction of the Commission.

In order to design it in that way, we must have given to us from time to time for the use of the design staff the design requirements, which may and do at various times involve parts of information that we must use in connection with the design.

That is kept over in this little area far to the west. The little building shown in red is where our office is, where the administration office is, that is within the security fence.

The CHAIRMAN. How far is that away?

Mr. WEIDNER. It is on the west edge of the construction area. It is about a mile and a half or a mile and three-quarters from the operating unit of the laboratory.

Now, this building over here in which I have my office and we have the engineering office—all of our engineering force have Q clearances. We have a standard three-combination concrete vault in which we have a locked file in which we keep this information as it is given to us until we are finished with it, and then we return it.

Senator KNOWLAND. Of this classified information which you keep in your office building there, some of it, of course, probably being more classified than others, what is the highest classification that you can recall? Would it be merely restricted, would it be confidential, would it be secret, or would it entail some top secret material?

Mr. WEIDNER. To my knowledge, Senator Knowland, we have never kept in that, since we have been on this site, anything above the level of secret. Whatever we have had to have of another nature, we would have gone to the other area, had our instructions in connection with it, and gone back.

Senator KNOWLAND. So that there is in that particular area of site D, west area, documents which would be of value to espionage agents if they could get their hands on them? In other words, you keep them in a three-combination safe.

Mr. WEIDNER. They are kept in a three-combination safe. As to your other question, Senator, I would say this: We do not get, neither do we desire to have anything except the express memoranda and design requirements which are necessary to us to design certain things. Now, we are not involved in the design of the classified or, shall we say, the equipment that goes in the building afterward. We simply have to make provision for it.

Consequently, it would be my opinion that unless someone were to be engaged in designing a basic research laboratory, which is what this is, and was interested in making provision for someone else to come in and install whatever they might like to do, the information in there would be of no value to them.

That does not, however, change the fact that we have handled all those documents there in strict conformance with AEC requirements. There is a guard in that building 24 hours a day. It is within a security fence. The memoranda that you have that you referred to in no way affects this. Guard post instructions of October 4, which are put out by the Austin Co., that is in the form of a bulletin. Now, the

Austin Co.'s procedure is that bulletins can only be superseded, amended, or changed by bulletins. Memoranda are simply those documents put out from time to time to their own guard force to elucidate what you want them to do, to explain something, to make it possible for them to operate in a better manner.

I have a copy of instructions to guard post No. 3, which is inside the building. I also have with me the original log sheets of that guard, which started—I have just picked them at random—from the 1st of May to the 6th of June, which covers a period both before and after, which demonstrates definitely that all visitors all during the day are recorded in, they are taken to the reception room, and then they go wherever they want to go. Because, after all, this administration area is the headquarters for all the construction, so you have a great number of people you must do business with who are not permanently on the site.

Senator KNOWLAND. Referring back to this site, I think you have clarified it to this extent: That your Austin Co. is responsible for what you show here in green, the two areas labeled "west area."

Mr. WEIDNER. Yes, sir.

Senator KNOWLAND. Rather than the entire site D. So it would probably have been more clear in your instructions if they had said "west area of site D."

Mr. WEIDNER. Senator Knowland, let me say this: We are handling this, the part that we are interested in is a standard construction operation. Outside of our own little problem in design, the security does not affect the other people. Consequently, the chief of the guards and watchmen and people who handle that were handling it in that normal construction fashion. It did not occur to them, it did not occur to any of the rest of us that it would be confused.

That is the ignorance of having lived in your own bailiwick and not wondering what somebody else will think about it. However, when it was brought to our attention, we immediately clarified that memorandum of May 10, and I will be happy to give you copies of the new one, which we think has removed all the confusion. We hope so, anyway. We have not reduced the number of names.

Senator KNOWLAND. I notice on this memorandum it is now headed "The Austin Co., Site D, West Area," which certainly clarifies that instruction.

Mr. WEIDNER. I can explain why the other one was on there. The contract reads to both our architect, engineer, and our constructors "Site D for the Argonne National Laboratory project."

Senator KNOWLAND. Now, on these prior instructions which allowed the following persons unlimited access to all areas, that would include both the disjointed part and the kidney-shaped part of the west area; is that not correct?

Mr. WEIDNER. This one over in here where the construction headquarters is.

Senator KNOWLAND. Yes.

Mr. WEIDNER. It was not so intended there, and there was no confusion. There was only confusion when somebody who had not received oral instructions from the guard lieutenant read it. It was to provide each guard and watchman with the names of people whom he could expect to pass into the separate construction areas.

Senator KNOWLAND. I notice on the new instructions, which seem to me to be much better—

Mr. WEIDNER. Thank you.

Senator KNOWLAND. If I may be pardoned for saying so—this memorandum refers to and supersedes subject memorandum dated May 10, 1949, upon proper identification of following persons—then you leave out “and their guests,” and you say they will be allowed access to those areas of site D under the jurisdiction of Austin Co. except that only those persons whose normal place of business is in the Administration Building and construction headquarters shall have access to that building, that access to be in accordance with the presently established guard regulations covering the operation of post No. 3.

I want to commend you on this language, and I hope that if we have gained nothing else out of this phase of the hearing, that the other installations of the Atomic Energy Commission will take due notice and will be sure that their instructions to the guards are so clear that there can be no misunderstanding, because you may get a serious security violation through a misunderstanding of a new guard who takes at face value the instructions which you have given him.

Mr. WEIDNER. I might explain, Senator, that these are not truly guards; all of this force is not guards in the same sense as the operating units of the Commission are. These people are construction watchmen and guards.

Their primary purpose, of course, is to prevent the removal of Government property and tools from the site. They are interested in maintaining order throughout. We try to be courteous to the public; we allow the public to come through. The first one that you read was very restricted and we found that it would not work at all. So, we put out the one of May 10.

What we are trying to do is restrict the public from the construction areas themselves and still not prevent the public from going through, as they do in any other normal unfenced Government construction project.

Senator KNOWLAND. I merely wish to say for myself that I am satisfied now with the corrective steps that have been taken by the Austin Co. and, presumably, by the Commission itself in this matter, and I think they are to be commended upon promptly closing up what otherwise might have developed into a loophole which would not have been satisfactory.

The explanation, to me, is satisfactory on the basis that they have used. I think they have now tightened up this in a satisfactory manner.

Mr. WEIDNER. May I say just one thing, Senator Knowland?

What we have put in this memorandum is a statement of what has always existed. It has clarified what we had out before, which I am perfectly willing to agree was a poor choice of words.

Mr. HINSHAW. It will be noted that following the list of names, it stated:

The official duties of the above persons are such that their presence is required on the project at irregular and unanticipated times. Said persons will be fully responsible for any and all persons accompanying them.

I think that is slightly in contradiction to Mr. Knowland's understanding of the first paragraph, which he read. I assume that their

guests or the persons accompanying them are still entitled to entrance without further clearance.

Mr. JACKSON. Is that for the purpose of making sure that you have honest people in the area so they do not start walking off with material? It is not for any reason of security?

Mr. WEIDNER. It is not security.

Mr. JACKSON. This is purely a problem of trying to keep track in an orderly fashion of the building materials and supplies and equipment that are on the premises, a practice that would be followed in any kind of construction work; is that right?

Mr. WEIDNER. That is correct; yes.

Mr. JACKSON. This has nothing to do with security?

Mr. WEIDNER. No.

The CHAIRMAN. If there are no further questions on this phase, Senator Hickenlooper would like to take up another matter.

Senator VANDENBERG. Mr. Chairman, may I ask just one question, first?

The CHAIRMAN. Yes.

Senator VANDENBERG. It is of no particular moment, but my curiosity was aroused the other day as to why you were sufficiently interested in identifying the persons who could have free access and you were not interested in their guests.

It seems to me that you still confront that anomaly because you are still only requiring registrations of the persons listed above and you are explicitly excluding registration of their guests. I do not understand why you have no interest in their guests.

Mr. WEIDNER. Senator Vandenberg, probably the choice of words in naming them as guests was very poor. The people we have listed on here are the responsible people whose duties require them to follow the development of construction. The people they will be bringing with them may be visitors from other of the Commission's activities, they may be subordinates in their departments, they may be various material men with whom we have to develop certain things. If you will refer to the map again, the one thing on this map that is not shown—perhaps we should have shown it—they are the major building areas which this list allows—I mean which this memorandum allows these people and the people they believe should go with them to visit.

The general public is allowed to go back and forth as they see fit as long as they do not go in the major building construction areas separately.

Now, the reason for not registering guests or the people whom these other gentlemen have with them seemed logical to us inasmuch as these are the responsible parties and it is understood that they would be taking only people whom they have an interest in showing the place to, and since it has no security problem, being a problem of controlling Government property, it is a good bit like allowing officers in the Navy to clear themselves at the gate and take who they may with them into the navy yard and back again, which we all did many times during the war, and still do.

We require the guard or the watchman to count the number of people in the party for the sole purpose of keeping a record of how many were in and out, and if anything did develop, we know that John Smith, who may have been cleared by the guard on this list to go in, had five in his party at a certain time.

It is not that we are interested in either this man or the people he takes with him. We are simply trying to maintain some sort of property control so that we know who are wandering around the site.

Senator VANDENBERG. I do not want to belabor the point, because I think it is purely inconsequential, but I still find myself intrigued by your interest in registering known visitors whom you have already cleared and your lack of interest in unknown visitors whom you have not cleared.

Senator HICKENLOOPER. Mr. Chairman, I would like to present to the committee an instance of a serious breach of responsibility which includes within itself the elements of potential impairment of our national security, a violation of the spirit and, I believe, the letter of the law, and a very substantial departure from the program of isotope distribution as originally laid down by the Commission and upon which basis the approval of the program was made by the Secretary of State.

I think it clearly violates the scope and the limitations of the isotope distribution program as announced by the President on September 3, 1947.

In the Commission's proposal to the General Advisory Committee in 1947 it was made clear that the distribution of isotopes would be made for biological and medical research almost exclusively. On May 31, 1947, and based upon the Commission's proposal to the General Advisory Committee, that Committee concurred. During the middle of June the Medical Board of Review considered the matter and on August 19, 1947, the Commission formally adopted the program. According to the Commission's news release of May 24, 1949, the vote on this question was 4 to 1, with Commissioner Strauss voting in the negative.

On August 27, 1947, the Commission notified the Secretary of State of the action, and emphasized the purposes of the program to be humanitarian.

On August 28, 1947, the Acting Secretary of State acknowledged this notice and stated, according to the Commission's news release, as follows:

I note that these valuable products of United States atomic energy plants will now be available in the service of mankind and that, to this extent at least, we are able to advance toward the beneficent use of this new force. This initiative should promote harmony and good feeling among nations.

Based on your assurance that this offer on our part does not prejudice our national safety, and in view of the checks and safeguards set up in the distribution scheme as you outline it in the enclosure to your letter, the Department of State sees no objection from the point of view of foreign policy.

On September 3, 1947, the President made the following announcement of this program, at St. Louis, I believe:

I want to advise you that it is now possible for the United States to take an important forward step toward greater international cooperation in the field of medical and biological research. On behalf of the people of the United States I am pleased to announce to the Fourth International Cancer Research Congress that progress in the production of radioisotopes by the United States Atomic Energy Commission now permits limited distribution to qualified research workers in other countries of radioisotopes principally for medical and biological research. I know that the representatives of the United States attending the Cancer Research Congress share my hope that the open, impartial, and truly international character of medical research will carry over into the realm of other problems of world concern. The sharing by and among all nations of both the means and the results of cancer research will reduce the loss of life and human suffering from disease throughout the world.

Mr. Lilienthal has repeatedly referred to the distribution of radioactive isotopes, produced in our own atomic piles, and has constantly assured us that their distribution is for humanitarian purposes.

Now I come to the point.

On May 28, 1949, it was reported in the New York Times in a dispatch from Oslo that the Norwegian Defense Establishment has been negotiating with the United States for radioactive isotopes. This report is not quite correct. The isotopes had already been sent. The sender is the Atomic Energy Commission. The recipient, you will note, is not a hospital or a university but a part of the military establishment of a foreign government. It would torture reason to presume a humanitarian objective in the research conducted by a military establishment. The fact is that the purposes for which this shipment was sought by the Norwegian Military Establishment and the purposes designated by the Commission for which they were sent are not for medical or biological purposes but are definitely and specifically for purposes which have a direct bearing upon very important military research. This definitely marks a departure from the announced policy and I believe a clear violation of the purposes and program as laid down by the President, as well as by the Commission, and as well as that understood by the State Department.

Mr. Chairman, I have a little more in this statement, but I would like to say that I have specifically refrained from naming the purposes for which these isotopes were solicited and for which they were sent solely for the reason that the document or the report which reports them is not classified as confidential or restricted, but it does have placed on there by the Commission the words "Not for publication."

Personally, I see no classification on the document, I see no reason why the purposes could not be made public, but because of that I did not want to state it unless the Commission felt it was all right. As I say, the document has no classification.

The CHAIRMAN. Mr. Lilienthal, is there any particular reason why this should not be for publication?

Mr. LILIENTHAL. May I see it? I would like to make this preliminary comment. I realize that procedures of a legislative committee are not those like any other procedures, but I understood after Mr. Cole's remark about the effect of having a room full of people who should be at their other work, that we would be given some kind of reasonable notice as to what matters were going to be taken up, and this morning less than an hour before this meeting, at 10:15, which is about the time we left for the Hill, Mr. Bergman of the committee staff called to say that upon checking with Senator Hickenlooper's office, he was told that, and I quote, "Senator Hickenlooper will take up some personnel clearance matters relating to isotopes."

This was a very puzzling message and, as a result, the memoranda relating to this matter and the individuals who have them in charge are back at their work. They will be here shortly.

This subject, it may be personnel clearance matters relating to isotopes, but the definition of it was not very helpful. If I may examine the paper while these documents are on their way—

The CHAIRMAN. I might say for Senator Hickenlooper that, of course, the difficulties that have arisen due to the questions we have been discussing and also due to the fact that the committee has not yet passed upon six of the requests, has put an unusual burden upon

him in the presentation of his case. I just want to say that for the record.

As far as the transmission of that somewhat mystifying designation of what was to be taken up, of course, I cannot speak for Senator Hickenlooper's staff, and I have not asked Mr. Bergman. At any rate, we must keep in mind that the Senator has been somewhat hindered so far in the presentation of his case through difficulties that we e inherent in the problem.

Mr. LILIENTHAL. I am only suggesting that we will have to have virtually all of our staff members here with all the documents and all of our records if we are going to be confronted with such a situation as this is this morning, and that is what we will have to do.

Senator HICKENLOOPER. This is probably an understandable mistake. We thought that we had made it clear that we were going to continue talking about personnel clearances and probably refer to the isotope program later as a second field. We thought we had made that clear. Perhaps our office did not make it clear to Mr. Bergman.

The CHAIRMAN. At any rate, we are sure you will cooperate with us and with the Commission in endeavoring to give them as much notice as possible.

Senator HICKENLOOPER. I would like to complete my statement, if I may.

The CHAIRMAN. Let me get an answer to the question from Mr. Lilienthal as to why that is marked "not for publication." I realize the answer might be something that you would not want to give publicly. If so, you can just say so.

Mr. LILIENTHAL. There is nothing secret about isotopes and nothing dangerous about them, and there is nothing dangerous or secret about the statement.

The reason it is not for publication is that we present semiannual summaries, and until those summaries are prepared, the monthly statements are not published, but there is no reason at all why this should not be—

The CHAIRMAN. I am glad of that, because that removes the difficulty.

Senator HICKENLOOPER. Then at this point I will say that on April 28, 1949, the isotope of iron 55 in the amount of 1 millicurie and with the reference "highest specific activity" was shipped to Norway to the Norwegian Defense Research Establishment, Kjeller, near Lillestrom; the purpose was the investigation of the rate of diffusion of iron in steel at high temperatures.

Mr. Chairman, I will continue my statement. I have just a few more words here.

It is significant that in the periodic press release on the distribution of isotopes made by the Commission, no mention is made of the purposes of this particular shipment.

In fact, I think it applies to the purposes of other shipments, that they are not generally mentioned.

While section 5 (c) of the Atomic Energy Act makes reference to the distribution of radioactive material for research—and authorizes it, I am quite sure, upon reading the statute—it is to be noted that section 10 (a) (1) provides as follows:

That until Congress declares by joint resolution that effective and enforceable international safeguards against the use of atomic energy for destructive pur-

poses have been established there shall be no exchange of information with other nations with respect to the use of atomic energy for industrial purposes; \* \* \*

I also call attention to the fact that numerous shipments of radioactive isotopes, all of which have been produced in our atomic piles, have been sent, among other destinations, to the Joliet-Curie establishment in France. I am happy to have the benefits of biological and humanitarian uses of this material, but I call attention to the fact that the social and political views of Madame Curie and her husband have been widely publicized not only in Europe but in the United States.

I call attention to the fact that once these isotopes leave our possession we lose control of the actual use to which they may be put and we lose control over the destination of either the isotopes or the information gained therefrom. I also call attention to the fact that many of these isotopes can, in fact, be used for the development of information that will not be used for the benefit of mankind nor for humanitarian purposes.

The reference to the Norwegian Defense Establishment shipment was contained in the Commission's report to the committee for the month of April 1949.

I want to call to your attention also, Mr. Chairman, the fact that in May 1949 three shipments of isotopes, radioactive isotopes, in the amount of 1 millicurie each—1 calcium, 1 cobalt, and 1 zinc—were sent to Finland to the University of Helsingfors. The purposes given here which they were applied for, the purposes listed here show it to be, as to the radioactive calcium, for radioactive standards for measurement of radiations; the second shipment of cobalt, I believe—if "CO" stands for cobalt—is another one of the radioactive standards for measurement of radiation; and the third shipment of zinc, radioactive zinc, to Finland is for the radioactive standards for measurement of radiations.

Now, I think it is only fair to say, Mr. Chairman, that, without doubt, in medical and biological research the radioactive standards for measurement of radiations may be important—without doubt—but it is also important in other phases and fields of atomic research which may not be beneficent or which may not be humanitarian.

Now, the point that I am trying to make is that while we believe in the extension of humanitarian aids in biology and medicine and medical research to as much of mankind as we can, yet it has been at least my firm understanding—I am sure it is the complete interpretation of the President's announcement of the radioisotope shipment program, and of the State Department—that this is to be strictly and completely controlled and limited to biology and medicine and perhaps some plant experimentation in agriculture and perhaps some basic research application.

I suggest, Mr. Chairman, that the beginning, the opening wedge, for the shipment of isotopes for a purpose other than humanitarian—and without that, a military establishment that studies the rate of diffusion of iron and steel at high temperatures, that very thing alone has a high significance to those who know what the deficiencies are in some military programs today—I suggest that it is the beginning of the opening wedge where information may, perhaps not by intent—I do not know, but it is an exercise of discretion and authority in this program that has a potential imperilment to our national security.

Senator MILLIKIN. Is there any reason why we may not know the industrial significance of what Senator Hickenlooper has been talking about? I mean the military-industrial significance.

Senator HICKENLOOPER. Let me consult the chairman. After consultation with the chairman, I believe he and I are in agreement that—and I may say, Senator Millikin, I possess no information, I am not qualified as a scientist in any way, I am repeating what qualified scientists have told me—that the use of this material or similar materials, radioactivated, is very valuable indeed in research in the development of higher temperature steels which will withstand the heats of the sleeves of jet engines.

Senator MILLIKIN. Rockets?

Senator HICKENLOOPER. Rockets, and it has many other steel experimental uses in developing finer qualities of steel and steel with special qualities, the discovery of which we may not have yet made ourselves. It has many uses, and this illustrates one use to which it can be put in research and investigation.

Mr. JACKSON. Mr. Chairman.

The CHAIRMAN. Mr. Jackson.

Mr. JACKSON. I understand that with the exception of the Norwegian case, that this information was released back in August 1947, August 27, the radioisotope program. Has there been any legislation introduced or any recommendation to the Atomic Energy Commission to terminate this program since that time?

Senator HICKENLOOPER. I might say, Mr. Chairman, that, generally speaking, an examination of the isotopic distribution system indicates that, with few exceptions, it has gone to friendly countries, countries with whom we are on the best terms scientifically and otherwise, and, with very few exceptions, it has gone strictly for medical research and biological research and some agricultural research.

The CHAIRMAN. The complaint, Senator, is not as to the policy of shipping isotopes but to the following out of that policy or carrying it out by the Commission; is that your point?

Senator HICKENLOOPER. That is it. And this particular shipment which startled me when I examined the record a few days ago is a definite departure from that policy and a definite invasion of at least the industrial field, and it goes to a military establishment, and I do not know exactly what they are going to do with it, but I believe a military establishment is primarily interested in military things. This occurred April 28, 1949. It did not occur last year, and it was just reported to the committee 2 or 3 weeks ago.

Mr. JACKSON. In order that I understand the issues that are before the committee, is the condemnation directed toward the export of isotopes in general or just this Norwegian shipment?

Senator HICKENLOOPER. I have raised no objection to the general program. That is not an issue. I am raising an objection to the deviation from the program as announced by the President, from the program as announced otherwise, and going into this particular field as the first definite step in deviating from this humanitarian program.

Mr. JACKSON. In other words, the Norwegian shipment—

Mr. PRICE. We cannot tell whether there is a deviation or not until we hear the explanation as to the shipment.

The CHAIRMAN. That is, of course, true. Before Mr. Lilienthal gives any explanation, I may say that the problem of the shipment

of radioactive isotopes was very carefully considered in the committee when we deliberated on this act, and we, equally deliberately, provided that the uses of atomic energy for industrial purposes and the prohibition on the dissemination of information pertaining thereto did not include radioactive isotopes.

I think it should be said for the record that many of the men who are on this committee deliberated on the general policy at the time that the act was under deliberation; so it is not the policy that is being questioned but rather it is the action taken under it in specific cases.

Mr. JACKSON. I was just trying to define what the issues were, whether we were going into the whole radioactive isotope export program or whether it is limited to this Norwegian report here presented this morning.

The CHAIRMAN. Senator Hickenlooper?

Senator HICKENLOOPER. There is one other matter that I called attention to. I referred to the fact that we cannot follow these isotopes and completely control them when they are gone. We must rely on reports and visitations. We cannot be there all the time.

I called attention to the fact that isotopes had been shipped to the Curie Institute in France, not that I want to keep the French people's regular research institutes from getting the benefits of the humanitarian research, but I called attention to the fact that the Curies' political and social views are known all over the world, and we have lost control of the isotopes once they are shipped.

Mr. COLE. I should like to inquire of the Senator from Iowa if he is advised of the considerations that confronted the Commission when this decision was made last summer with respect to isotopes, which resulted in a lack of unanimity in the Commission.

Senator HICKENLOOPER. No, not specifically. We were very interested in the isotope program, the committee and everybody else, and I understand that Commissioner Strauss had some feeling on the matter, and he is here with the Commission. I think he could better speak for himself.

I would not undertake to interpret another man's intricate reasons or his substantive reasons for voting as he does. I do not know.

The committee did consider it at length, and we went all through it.

The CHAIRMAN. It will be developed. I suggest we permit Mr. Lilienthal to proceed to an explanation, and, then, of course, in the normal course of events we should hear from Commissioner Strauss as to his views.

Are you prepared to go forward with an answer to this question, Mr. Lilienthal?

Mr. LILIENTHAL. Yes, I would have been better prepared if I could have known about this at 9:30, but I think sufficiently for the purposes of this preliminary discussion.

First, may I say at the outset that I do not know of any problem of this character that has received more careful, patient, painstaking consideration within the staff of the Commission, among its scientific and technical advisers, and with the Joint Committee.

This whole matter, over an extended period, has been very carefully, and not casually, explored, and the members of the committee, examining the written record and recalling the conferences with the committee, will bear that out, I believe.

Second, I would like to see if I am proceeding on the correct basis. I am not clear whether the objection to the shipment to the Norwegian Research Institute is an expression of fear as to the friendliness or unfriendliness of Norway to this country and to the democracies or whether this is a different kind of objection. The emphasis on the shipment to Norway raised it in my mind.

Senator HICKENLOOPER. I can clarify that right now. I consider Norway a very friendly country to the United States.

Mr. PRICE. It is an Atlantic Pact country, is it not?

Mr. LILIENTHAL. I understand Norway is included in the discussions of military aid, so I, therefore, assume this is not fear that Norway will betray us, but some other consideration.

I would also like to say in a preliminary way that the figures, while I do not have them precisely in mind, will be approximately this upon a reexamination of them: That 80 percent of the shipments abroad of isotopes are in the field of medicine, medical treatment, and biology; and we make reports to the committee and public reports to the Congress on these statements and their character.

Senator KNOWLAND. Mr. Chairman, right at that point, so we can clarify the issue down to the fundamentals and get our teeth in them, if it be 20 percent, you said 80 percent relates to medical research, et cetera, but let's deal specifically with the problem which appears to be, regardless of how otherwise desirable it might be, in violation of a specific section of the law, that no shipment shall be made without a joint resolution of the Congress if it relates to industrial processes.

Mr. LILIENTHAL. Senator, with all respect, I do not believe that is what the provision says. It reads:

Until Congress declares by joint resolution—  
this is on page 13 of the printed statute, section 10 (a) (1)—

that effective and enforceable international safeguards against the use of atomic energy for destructive purposes has been established, there shall be no exchange of information with other nations with respect to the use of atomic energy for industrial purposes.

Now, all basic research is aided by the use of these isotopes, but I do not think anyone would suggest that the shipment of isotopes themselves is an exchange of information. At least, no such suggestion was made when we discussed this matter with the committee, and I do not know that anyone has.

Senator KNOWLAND. Just a minute. You mean that on your theory on which you are now pursuing this that regardless of the fact that the isotopes of a particular type can be used in industrial processes, that the Commission now feels that they have an unlimited precedent to ship them any place without a joint resolution of the Congress? This is just so we can clarify the issue, so we can understand it on this side of the table. What is in your mind?

Mr. LILIENTHAL. The provision of section 10 (a) (1)—that has never been construed by anyone in the long discussions that have been had with the committee and within the Commission to affect the export of radioactive isotopes on the basis that they involve an exchange of information with respect to the use of atomic energy for industrial purposes.

Now, it is perfectly true that any basic research, basic metallurgy, structure of matter, can at some juncture have value for industrial purposes, but it is not that kind of information that is referred to here.

Senator KNOWLAND. I want to clear this point, because I think it is a very vital point that we on this committee must thoroughly understand. By the same reasoning would it not permit the committee to ship manufactured uranium of various types and classifications along with isotopes, if your theory is correct; is that right? Because you would not be shipping over information. It might be used in a pile of some kind, and on the same theory which you have just expressed and which is a little astounding to me, I must say, you could make the shipments of uranium just as well as you could make them of these isotopes; is that not correct, under the principle you have just enunciated?

Mr. LILIENTHAL. No, I disagree.

Senator KNOWLAND. Will you differentiate as to where I have misunderstood you, then?

Mr. LILIENTHAL. The provision of the law relates to the use of atomic energy for industrial purposes. The use of radioactive isotopes is not, in any one's opinion I have heard expressed thus far, the use of atomic energy for industrial purposes.

Senator KNOWLAND. Even though it is used in the manufacture or exploratory work on the manufacturing of sleeves for jet engines and rocket propulsion?

Mr. LILIENTHAL. It is not atomic energy. Radioactive isotopes are not atomic energy. Let me give you some background to indicate these questions have been considered carefully.

Counsel calls my attention to the fact, before we go to the background, that the statute contains one flat prohibition, a flat prohibition on the export of fissionable material and that, of course, has been fully complied with and is not involved in this picture.

The degree to which this matter has been explored, I think, has a good deal to do with the suggestion that this latest shipment to Norway in some way endangers the common security and defense and is a deviation from the law.

Senator Hickenlooper has said that he is not a scientist, and I am not a scientist. There are not very many scientists in this room, but questions involved here do have a technical—

Senator HICKENLOOPER. Mr. Lilienthal, in the current issue of Collier's under your name in an article it says, "A noted scientist, David E. Lilienthal, writes the following article." I assumed you were a scientist from that.

Mr. LILIENTHAL. I think the Senator has a better understanding of my background and limitations than Collier's headline writer, and if he has not, I will quickly demonstrate it.

But we do rely upon scientists, and I may say this question of the export of radioactive isotopes to the Norwegian Military Institute, and the whole question of the criticism that has been directed—and wholesome and helpful criticism it is—directed against the export program, and the export program itself was reexamined by the Statutory General Advisory Committee as recently as last Friday and Saturday. They were in session, and I should think it would be very helpful—this is regarded as a grave matter, but I do not think it will be after we explore it a while—to have some of these men called before the committee.

These men are not dopes and they are not unpatriotic men, and they are not naive men. Dr. James B. Conant, who is a member of this com-

mittee, his war service and his sensitivity to things that are injurious to this country's interests, are as great as anyone I can think of; and Dr. Lee DuBridge, president of Cal Tech, whose war service is notable, is a man with a lot of savvy. These men are not innocents.

They reexamined this thing, and I am advised that the particular question of the Norwegian shipment was brought to their attention, and they have sent to us, dispatched to us as of yesterday, I believe, a statement relating to their reexamination. I should like to read it, since it is only two paragraphs. This, I should say, is a statement from the General Advisory Committee to the Atomic Energy Commission regarding foreign distribution of isotopes and the fellowship program, and it reads:

We have had from the Atomic Energy Commission itself and from the Director of Research a request to reconsider the question of the distribution of isotopes abroad and the question of AEC fellowships; both of these questions were referred to us again because of public criticism of the Commission's policy.

I will read only the portion relating to the subject under discussion:

With regard to the isotopes distribution we have reexamined in detail the statement made by us at our fourth meeting.

This was a statement made as of June 1, 1947, a copy of which was supplied to the joint committee—that is 2 years ago—and to which I should like to refer in a moment. To repeat a bit:

\* \* \* we have reexamined in detail the statement made by us at our fourth meeting. Despite the criticisms that have been voiced to Commission policy, we wish to reaffirm our conviction that these recommendations constituted sound policy. We believe that it would be useful to have available a documentary account of how the results from the foreign distribution of isotopes have in fact served to further progress in therapy and in research.

It is in basic research in metals, as I understand it, that this Norwegian shipment is to be used.

Then they refer to the General Advisory Committee's unanimous conclusion of June 1, 1947, and in view of the importance attached to this, I would like the opportunity of reading it, and it is about 300 words:

The Atomic Energy Commission has authorized the distribution of specified radioactive materials to scientists in foreign countries, through their respective governments, in order that these valuable by-products of atomic energy work may be employed in scientific and medical research and in therapy.

This represents an important step in implementing the declared purpose of Congress, as stated in the Atomic Energy Act, to utilize the developments in atomic energy for "improving the public welfare \* \* \* and promoting world peace."

May I interject and say that that provision in the preamble of improving the public welfare and, particularly, promoting world peace is still in the law, and it is still the Commission's duty to seek in every reasonable way to further it.

Continuing with the statement of the General Advisory Committee:

These radioactive isotopes, such as radio phosphorus are made by exposing materials to the intense neutron radiation from the chain reacting pile at the Clinton Laboratories, Oak Ridge. They are very valuable tools for research in chemistry and biology and in treatment of certain diseases. A plan for making them available at cost to United States scientists for research purposes was announced a year ago. They will be equally valuable to scientists and medical men abroad and the research done with them will benefit all mankind.

In these days when the restoration of free science and the building up of good will among people is so vital, it is essential that the United States should

take this step to share its new tools for research and therapy with other countries, and thus prove that this democratic country will do all it can, consistent with its own defense and security, to improve the public welfare and raise the standard of living throughout the world.

It is emphasized that the quantity of radioactive materials required and to be made available for research are extremely small, so that they can be used with safety with only ordinary precautions, that they are not useful for military or industrial employment of atomic energy and cannot constitute a danger to world peace or to the security of the United States. Also the materials are now produced in sufficient quantities so that foreign distribution will not interfere with an ample supply for United States scientists.

The conditions under which these materials will be sold at cost to an individual scientific laboratory are such as to insure that the sole purpose for which they will be used is for research or medical treatment. The research results obtained are to be published and reported to this country and the laboratories are to be open to qualified scientists in accordance with established traditions of free science. Thus diversion of the material to secret or military research will be difficult and any continued diversion of this sort will be impossible.

The radio isotopes available were well known to scientists before the war and can be produced by standard instruments such as cyclotrons.

May I interject at this point the fact that the French have a pile, have a chain reacting pile of their own, built with their own resources, and that this pile is available for the production of radioactive material.

The CHAIRMAN. How about the English?

Mr. LILIENTHAL. The English also have in operation a pile, which produces and is capable of producing and is producing radioactive isotopes.

Mr. PRICE. Do not the English distribute isotopes?

Mr. LILIENTHAL. The English do distribute isotopes to friendly countries in the west of Europe.

To continue:

However, the scientists in countries abroad do not have access to such facilities on any scale—

this has been since modified, this is 2 years ago—

and the quantities and concentrations producible in a pile are such as to be more useful to science. It is therefore a very great service to have the materials available immediately.

The Commission also points out that a continuous supply of radioactive isotopes is necessary for such research, but that such supplies cannot accumulate since they are mostly of relatively short life and because they are expended in the experiments themselves beyond practical recovery.

Finally the Commission will maintain continuous contact with the laboratories supplied with the material, will expect the foreign governments to certify the qualifications of the scientists applying and to assure the United States that the materials will be used only for the purposes stated. Under all these conditions the beneficial results of the program will be great in terms of good will and it may assist distinguished foreign scientists abroad who work in open laboratories to make important discoveries of benefit to all.

I will say that the question of the particular shipment about which the question has been raised here was, I understand, brought to the attention of the General Advisory Committee, and its conclusion was on the whole matter to confirm, as of last week, the end of last week, Saturday, I believe, in a dispatch made available to us yesterday, its conclusions of 2 years ago.

There is a great deal more that can be said on the subject and will be said on the subject, but this lays the ground work.

Senator HICKENLOOPER. Did the General Advisory Committee come to a conclusion recently on this specific shipment?

Mr. LILIENTHAL. I am told that the question of the Norwegian shipment was specifically discussed with them, and the answer was the report I had, that the criticism of it did not impress them, at least to the extent of their making any—

Senator KNOWLAND. Is there a written recommendation in that regard?

Mr. LILIENTHAL. No. So far as I know, they did not, but they are available for questioning here before the committee.

Mr. PRICE. Was it your personal decision?

Mr. LILIENTHAL. No. There are no personal decisions in our 5-man Commission. This was not a personal decision. It was the decision of the Commission as a whole. The decision as to the Norwegian shipment?

Mr. PRICE. That is right.

Mr. LILIENTHAL. No. This was a shipment made under procedures previously determined upon by the staff of the Commission.

The CHAIRMAN. Senator Hickenlooper?

Senator HICKENLOOPER. I have nothing except to add this or restate this: That in this situation I have not raised the issue of objection to the isotope program as announced by the Commission originally, and by the President and accepted by the Secretary of State.

My point goes to the complaint that this is the first definite diversion from that policy, in my judgment; it goes away from the humanitarian, medical, biological research field, and goes into the industrial field. That is the point of my complaint.

I tried to make clear that I do not know of any other similar diversions, but this is the first one I know of, and it is a recent one.

Mr. LILIENTHAL. Mr. Chairman, may I say that this is the first advice we have had from any member of the committee that there was objection to this particular shipment or a shipment of this character, and we, of course, are happy to explore with the committee the questions involved in this and get the views of the committee.

Senator KNOWLAND. Mr. Chairman, at this time it would seem to me to be appropriate, because we are all interested in the common defense and what appears to be a departure from at least the pure medical end of it, getting into the industrial phases, I would like to have the views of Admiral Strauss on this question.

The CHAIRMAN. Just before we do that, I would like to ask Mr. Lilienthal one question. There was a Finnish request for a shipment of radioactive isotopes, and while that was in the course of consideration, I believe they thought we were too slow about it, and they got them from Great Britain. Is that correct or do you know about that?

Mr. LILIENTHAL. I believe that is a correct statement of fact.

Senator HICKENLOOPER. They have received shipments here, Mr. Chairman. I put three shipments in the record here in this last report, the Finns.

The CHAIRMAN. On one request they made for a rather unusual quantity of isotopes, that matter was given consideration. Before it was determined whether to accede to the request or not, the Commission was advised, as I understand it, that they did not need them from us because they had gotten them from Great Britain.

Mr. LILIENTHAL. That does correctly describe the first request. As Senator Hickenlooper said, there were other requests, and there have been other shipments since that time.

Senator MILLIKIN. I suggest that if this is undesirable policy, Mr. Lilienthal, it does not mitigate it any by suggesting that they can be gotten elsewhere. The question is: Are we doing our duty here? What is your reaction to that?

Mr. LILIENTHAL. We should like very much to discuss this because there is more to be said.

Senator MILLIKIN. I am assuming for the purpose of the question that it is undesirable policy, and if it should be undesirable policy, it does not mitigate it by saying they can get the isotopes elsewhere.

Mr. LILIENTHAL. I think it is somewhat more complex than that because of the problem of our maintaining friendly relations—this is a State Department matter—with nations who will get them either from us or others. At least, this is something I hope the committee will consider.

Senator MILLIKIN. I notice your challenge to the point that provisions of the law do not cover this particular shipment. This is a by-product of atomic energy, is it not?

Mr. LILIENTHAL. Yes, it is.

Senator MILLIKIN. Is not the actual delivery of such a byproduct the ultimate in the exchange of information?

Mr. LILIENTHAL. I believe not.

Senator MILLIKIN. I would like to have your reasoning on that. If you and I are engaged in conversation about what can be done with the isotope, and I say, "Well, Mr. Lilienthal, we are just in the talk stage and I would like to find out what can be done with the isotope," and you hand me the isotope, I have got the ultimate in the exchange of information.

Mr. LILIENTHAL. No. I am trying to think of a simple analogy, and I think the simplest analogy is perhaps that of a microscope or any other research tool. To transmit to a person a microscope would not be the ultimate of information that would be revealed by a microscope or interpretation of it.

Senator MILLIKIN. Might not be revealed by the microscope, but if you are talking about what is a microscope and you hand me a microscope, that is the ultimate in exchange of information as far as microscopes are concerned. You are going into a further subject. We are talking about isotopes and what can be done with the isotope, and I am curious about what can be done with the isotope. We are talking about it now, and a little bit later you hand me the isotope and say, "Find out for yourself." Is not that the ultimate in the exchange of information?

Mr. LILIENTHAL. The statute does not say, "Exchange of information about isotopes." It says, "Exchange of information with respect to atomic energy for industrial purposes," and that is not what this is.

Senator MILLIKIN. You said this is a byproduct of atomic energy, and under the description of the shipment it is for industrial purposes. What is the use of experimenting around with the distribution of molecules in iron and what you can do with radioactive isotopes and tracing them if it is not for an industrial purpose? And what would a military establishment be doing it for unless it were for a military-industrial purpose? I do not think we quite clinch. I am not arguing the case, but would like to have a little—

Mr. LILIENTHAL. I think it would be helpful to have someone here in the witness chair who knows what he is talking about in the scien-

tific field. This seems to be clear, to me at least. This is where we stand.

Mr. PRICE. Maybe Dr. Smyth could help us there.

The CHAIRMAN. Would you like to volunteer, Dr. Smyth?

Dr. SMYTH. I would be glad to.

The CHAIRMAN. Mr. Lilienthal did not hesitate to waive.

### STATEMENT OF HENRY D. SMYTH, COMMISSIONER, UNITED STATES ATOMIC ENERGY COMMISSION

Mr. SMYTH. I would say that Mr. Lilienthal's analogy of the microscope was a fairly good one. These isotopes, as far as their existence and their properties are concerned, are perfectly well known abroad.

Therefore, they are not going to learn any more about the isotopes by having a sample than they would learn about microscopes, by getting another microscope or several microscopes.

Senator MILLIKIN. But, doctor, the qualities of the isotope may be well known, but they are not so well known that they do not desire the actual isotope for further experimentation.

Mr. SMYTH. For use as you would use a microscope.

Senator MILLIKIN. For use. Is that not the ultimate exchange of information?

Mr. SMYTH. I should certainly not think so.

Senator MILLIKIN. I want to find out what I can do in the way of use with an isotope, and you and I are talking about it, and you supply me with the isotope and say, "Find out for yourself." Is not that the ultimate in the exchange of information?

Mr. SMYTH. No, I should not think so.

Senator MILLIKIN. What remains?

Mr. SMYTH. I would say—let's continue on the matter of the microscope, if you wish.

Senator MILLIKIN. Let's keep on the isotopes. If we were exchanging information as to a microscope, the ultimate exchange would be to hand me a microscope. I agree.

Now, we are talking about isotopes. If we are exchanging information about isotopes, I respectfully suggest the ultimate exchange of information is to hand me the isotope and say "Find out for yourself."

Senator KNOWLAND. Might I just add right at that point, Senator Millikin: The Russians knew that the B-29 existed and yet when a B-29 landed there they had an opportunity to work on one, take it apart, and the general impression in the military establishment of this country is by having the sample in hand, they have been able to pretty well duplicate the B-29.

Mr. PRICE. That is in the field they already know pretty much about.

Mr. SMYTH. I wish we knew as much about the nuclear structure of these various isotopes as we know about the B-29; but actually the point of getting the isotopes is merely, for uses, at least, to have a particular kind of material that can be easily identified.

That is, we use the atoms of the iron isotope, for example, as tagged atoms. They are atoms that you can mix in with other iron atoms and follow their course.

Senator MILLIKIN. For what end purpose, Doctor?

Mr. SMYTH. For any end purpose that you might want.

Senator MILLIKIN. Exactly.

Mr. SMYTH. You might want to put the iron isotopes in something that you would take into your body to follow where the iron atoms went in the blood. In fact, if I remember correctly, the use of radioactive iron was very important in the study of blood plasma during the war.

Senator MILLIKIN. I assume I might also want to find out how to develop a heat-resisting material in magnitudes not now known, and that this isotope might be useful for that. That could be an end purpose; could it not?

Mr. SMYTH. It could be; it does not seem to me it is an immediate direct use. It is a use; the development of such materials probably depends on getting further information and understanding of the solid state.

Senator MILLIKIN. Would you say it is useless for that purpose?

Mr. SMYTH. For getting further information about the solid state?

Senator MILLIKIN. Yes.

Mr. SMYTH. No; I certainly would not.

Senator MILLIKIN. Of course not. That is why they want the isotopes; is it not?

Mr. SMYTH. I do not know.

Senator MILLIKIN. Mr. Chairman, what is the specific reason for the isotope shipment to Norway?

The CHAIRMAN. Investigation of the rate of diffusion of iron and steel at high temperature.

Senator MILLIKIN. That is what they want to find out. That would be useful to know in connection with heat-resistant material; would it not?

Mr. SMYTH. It might be useful to know, but it is a problem that was first suggested, as I recall, that kind of use of radioactive isotopes was first suggested and first talked about in our laboratory, probably many others, 7 or 8 or 10 years ago, by people who were interested entirely in the theoretical study of the solid state; that is, of metals.

Senator MILLIKIN. Let's assume I were qualified to do it, and I had completed my theoretical studies, but I would actually like to find out in practice. The best way I can find out is to get some isotopes; is it not?

Mr. SMYTH. I would not like to say what is the best method of going from a theoretical study to—

Senator MILLIKIN. That would be a useful way of doing it; would it not? That would not be precluded as a way of doing it; would it?

Doctor, why do these people want these isotopes if they do not consider it a useful way of getting information?

Mr. SMYTH. I do not know. I am trying to tell you what they may want them for. You may also be right. It is very likely they may want them to study steels. I do not know.

Senator MILLIKIN. They have said so in their request.

Mr. SMYTH. Steels for a particular purpose.

Senator MILLIKIN. We do not know the particular purpose, but we know what the purpose might be.

Mr. SMYTH. That is right.

Senator MILLIKIN. Does the Commission know the purpose, as far as you know, except the specification?

Mr. SMYTH. No, I have been serving the Commission for a week and have spent most of the time down here, so I do not know.

Senator MILLIKIN. There has been some criticism of the large number of employees of the Commission sitting around here. Personally, I regard that as very wholesome.

It is a constant reminder that we have some laws in the United States and that the Commission is subject to those laws; and, if these gentlemen can be kept here until they can be infiltrated with that basic thought by their attendance here, it might not be a bad idea.

Now, let's get back to what we are talking about, Doctor—these people over in Norway. A military establishment wants isotopes, I assume, for information, and they have specified the kind of information they are interested in.

Does that preclude a study for further development of heat-resistant materials in connection, let us say, with rockets or in connection with high-speed planes?

Mr. SMYTH. It certainly does not preclude it.

Senator MILLIKIN. Of course not. I do not think there is any difference of opinion between us, except you know so much more about the scientific end than I do.

The CHAIRMAN. Now, I think it should be emphasized, however, that there is no legal restriction on the exchange of information about isotopes contained in this act.

Senator MILLIKIN. I challenge the chairman's statement to that effect.

The CHAIRMAN. I think that can be documented completely and thoroughly.

Mr. SMYTH. I would certainly interpret that—it is a little difficult for me to act simultaneously as a lawyer and as a physicist.

Senator MILLIKIN. Do not hesitate. The lawyers go into the scientific field with equal stupidity.

Mr. SMYTH. Speaking as a physicist, I would say information about radioactive isotopes was not information about atomic energy or the use of atomic energy for industrial purposes.

The CHAIRMAN. That is the heart of it.

Senator KNOWLAND. Mr. Chairman, Senator Hickenlooper is coming back and can speak for himself, but in view of the chairman's statement that this in no way is covered by the existing law, I do not want to, by my silence, acquiesce to his interpretation of the subject, and I think that will have to be gone into further by the committee.

The CHAIRMAN. It is a proper matter for inquiry by the committee as to whether or not the Commission used good judgment under the power that was given to them in making this particular shipment. However, I also think that it is important for me to state at least my interpretation at this time of what the law provides, and it is that there is no legal restriction on the exchange of information about isotopes.

That requires legal interpretation. I give it as a lawyer who has given some consideration to the act.

Mr. ELSTON. Mr. Chairman.

The CHAIRMAN. Mr. Elston?

Mr. ELSTON. I want to disagree with the chairman in his interpretation of the law. It so happens that in the debate in the House more time was consumed on this particular section than on any other section.

The original act did not read like section 10 now reads, and I offered an amendment, which was debated at considerable length in the House, and later on the language was written as it appears in section 10, subsection 1, on page 13, which specifically and definitely provides that, until Congress declares by joint resolution that effective and enforceable international safeguards against the use of atomic energy for destructive purposes have been established, there shall be no exchange of information with other nations with respect to the use of atomic energy for industrial purposes.

Now, I am certain that the Congress meant no information, and when an isotope is transferred to another nation it certainly contains information which might be useful for industrial purposes; and, if it contains information, then it is a violation of the law, in my opinion, and the transfer of the isotope in this particular case was a direct violation of the law.

Congress did not care in what manner the information was transferred. They were concerned only with whether or not information was transferred to other nations which might be useful to those other nations for industrial purposes.

This certainly was not for any humanitarian purpose, but was for an industrial purpose, a military purpose is certainly an industrial purpose.

The CHAIRMAN. But not in connection, I might say, with the use of atomic energy for industrial purposes. That is the point—atomic energy.

Mr. ELSTON. If you have an isotope—

The CHAIRMAN. It is not atomic energy. Whether you think it is or is not.

Mr. ELSTON. We disagree about that.

Mr. PRICE. Can you produce isotopes from a cyclotron?

Mr. SMYTH. Yes.

Mr. PRICE. The prominent universities of the country can produce isotopes?

Mr. SMYTH. That is correct.

Mr. PRICE. They have been doing it. It is not atomic energy?

Mr. SMYTH. I would not consider it so.

Senator KNOWLAND. These are all pile-produced isotopes; are they not?

Mr. SMYTH. You can produce most of these isotopes either by a pile or cyclotron.

Senator KNOWLAND. I am asking about these particular ones that were shipped.

Mr. SMYTH. I presume so. Otherwise, I see no reason—

Mr. DURHAM. Mr. Chairman.

The CHAIRMAN. Mr. Durham?

Mr. DURHAM. I believe the doctor is qualified to give us a definition of atomic energy, and I would like to have your definition in the record at this point.

The CHAIRMAN. And why radioisotopes are not atomic energy.

Mr. SMYTH. May I say that I have regretted for a number of years that I was persuaded to use this term "atomic energy" rather than the term "nuclear energy," which is more appropriate, but it has now become accepted, so I will use it in that sense.

I would say that by "atomic energy" we mean in common parlance the energy released by the fission of uranium nuclei or any other nuclei that might split in that general way.

Mr. DURHAM. And a radioisotope cannot do that?

Mr. SMYTH. Radioisotopes give off a tiny fragment from the nucleus, a very small fragment rather than a complete disruption. It seems to me of totally different character.

The CHAIRMAN. May I read the definition of atomic energy as contained in this act, under section 18:

As used in this Act, the term atomic energy shall be construed to mean all forms of energy released in the course of or as a result of nuclear fission or nuclear transformation.

Senator HICKENLOOPER. May I ask Dr. Smyth a question?

The CHAIRMAN. Pardon me a second. Is that a correct definition, Doctor?

Mr. SMYTH. I should think so. I am not quite sure what you mean by "nuclear transformation."

Mr. HINSHAW. May I ask whether or not the radiation from a nucleus such as that coming from a radioactive isotope is not subject to that same definition?

Mr. SMYTH. Would you mind repeating that question?

Mr. HINSHAW. I asked if the radiation coming from a radioactive isotope is not the release of energy as described in that definition.

Mr. SMYTH. It is the release of energy as the result of a nuclear change, but it is an entirely different order of magnitude of nuclear change from the fission process.

Mr. HINSHAW. We were not talking about fission; we were talking about atomic energy or nuclear energy. Fission is a different thing, no doubt.

Mr. SMYTH. Fission is what I call nuclear energy in the sense that we are talking about it here.

Mr. HINSHAW. Here you have split off a piece of radiation in the form of energy; and, if that is not energy, I do not know what it is.

Senator HICKENLOOPER. Mr. Chairman, may I pursue that just a moment? That was the question I was going to ask Dr. Smyth. Does the isotope release energy? That is, the radioactive isotope. Does energy emanate from that isotope?

Mr. SMYTH. Yes, in a small amount.

Senator HICKENLOOPER. Now, then, is that emanating from the isotope as a result of nuclear fission?

Mr. SMYTH. No.

Senator HICKENLOOPER. What is it the result of?

Mr. SMYTH. It is the result of a relatively small change in the nuclear structure; whereas nuclear fission is a complete disruption.

Senator HICKENLOOPER. Is not that a byproduct or result of nuclear fission?

Mr. SMYTH. No.

Senator HICKENLOOPER. Does not nuclear fission cause the creation of the radioactive isotope? Is not that the source of the energy that causes the radioactive isotope?

Mr. SMYTH. No. It may be. You can produce radioactive isotopes in a number of ways. It is true that, when nuclear fission occurs, the fragments of the uranium nucleus which result from the fission process are radioactive and then continue in these relatively

minor transformations of energy, but you can also produce radioactive isotopes and do produce radioactive isotopes very frequently—in fact, usually in the laboratory, by bombarding nuclei, by bombarding ordinary materials with streams of neutrons, protons, or other particles. That is, the fission process is not required to produce a radioactive isotope.

Senator HICKENLOOPER. The radioactive isotopes produced in the atomic piles, are they produced as a result of nuclear fission?

Mr. SMYTH. There are two ways in which radioactive isotopes are produced in the atomic pile, sir. One is as the result of fission directly. That is, the radioactive fission products are actually mixed in with the uranium and separated out chemically later when the uranium is processed.

The other way of producing the radioactive isotopes in a pile is to use the pile merely as a source of neutrons. Put some material that you want to bombard with neutrons in the pile, and some of the atoms absorb the neutrons and are made radioactive thereby.

Senator HICKENLOOPER. Would you have any way of saying whether the radioactive isotope of iron that was shipped to Norway was produced as a result of the fission process or some other way?

Mr. SMYTH. That is one of those things I ought to know but do not.

Senator HICKENLOOPER. But can you in the pile, in an operating pile—well, if fission is not going on in the pile in some degree, can you create a radioactive isotope in that pile?

Mr. SMYTH. No; but you can produce a radioactive isotope in other machines.

Senator HICKENLOOPER. Yes; but that pile, when you produce radioactive isotopes in a pile, fission must be going on in that pile; regardless of what bullet hits the nucleus, fission must be going on in the pile in order to produce the end result of radioactive isotopes in that pile operation?

Mr. SMYTH. That is true, and it is also true that the fission must be occurring if you are going to produce hot air in the air that comes out of the pile.

Senator HICKENLOOPER. That is right. I am merely trying to pin it down to the designation in the statute, and I recall it has been testified that all of these isotopes are isotopes produced in the atomic pile. Therefore, I think it is perfectly clear to say that these isotopes are produced as a result of fission, nuclear fission; and then I go to the definition of atomic energy, which says, "The term 'atomic energy' shall be construed to mean all forms of energy released in the course of or as a result of nuclear fission or nuclear transformation."

I merely submit, Mr. Chairman, to the committee, that "in the course of" would take in other than the direct measures of fission bombardment. I mean it is a wider term than to limit it right down to fission.

It seems to me that would be the interpretation, the clear interpretation, of that act.

The CHAIRMAN. Doctor, ordinary radium is, in all respects, the same as radioactive isotopes, is it not?

Mr. SMYTH. That is correct, except that it occurs naturally.

The CHAIRMAN. Yes. Of course, we have no restriction on the shipment of radium anywhere. I believe not very much of it is found

in this country; I have never known it to be. Is the use of radium comparable to the use of radioactive isotopes in the treatment of cancer?

Mr. SMYTH. That is correct.

Senator KNOWLAND. Is it just as usable in the testing of steel to take high temperatures?

Mr. SMYTH. Well, it is more difficult to get, it is more difficult to control, it has different chemical properties.

Senator KNOWLAND. So these isotopes would be of far more value in the testing of processes for the development of high-temperature steel than what radium might be available to the person who is making the test, would it not?

Mr. SMYTH. I should think so.

Senator KNOWLAND. I would like, Mr. Chairman, before we recess today to ask Admiral Strauss to take the stand.

The CHAIRMAN. It is 10 minutes after one. I am entirely agreeable. What time does the Senator suggest that we recess? I have other engagements, and I am sure other members of the committee have also.

Senator KNOWLAND. Within 5 minutes, as far as I am concerned.

The CHAIRMAN. Very well.

Mr. Volpe, do you have an observation?

Mr. VOLPE. I would merely like to say in connection with the definition of atomic energy in section 18, the definition which is given here describes the process which is used in the reactor, which in turn produces the radioisotopes.

Therefore, atomic energy, as defined here, is the process within the reactor itself and not the byproduct, radioisotopes.

Senator MILLIKIN. Could you send the ultimate activated material itself under that definition?

Mr. VOLPE. Senator Millikin, we are speaking now of the definition of the term "atomic energy."

Senator MILLIKIN. I understand that.

Mr. VOLPE. And the only point I wish to make—

Senator MILLIKIN. Under your own explanation you could ship activated 235.

Mr. VOLPE. No, we cannot. There is a prohibition.

Senator MILLIKIN. There again you would have an ultimate exchange of information.

Mr. VOLPE. There is a flat prohibition in the law with respect to 235. My only point, Senator, was that atomic energy, as defined in the act, means the method by which these isotopes are produced and not the isotopes themselves.

Senator HICKENLOOPER. Just a minute. The definition of "atomic energy" in the act is clear, specific, and it is composed of two and one-third lines, and here it is, and this is not in any section of the act except the section on "General definitions," which means, of course, that wherever used in this act "atomic energy" means this:

The term "atomic energy" shall be construed to mean all forms of energy—that is, all forms of energy—

released in the course of or as a result of nuclear fission or nuclear transformation.

Mr. VOLPE. That is right, sir.

Senator HICKENLOOPER. That applies to every place in the act where the term "atomic energy" is used.

Mr. VOLPE. As I understand Dr. Smyth's testimony, Dr. Smyth has testified that it is by the process of nuclear fission that isotopes are produced. For example, the radioisotope iron—iron is injected into the pile, and through the process of nuclear fission, which the pile itself undergoes, the radioactive iron is produced; and the definition here has to do with the process of nuclear fission which takes place within the pile itself.

Senator KNOWLAND. Is it your interpretation, as counsel for the Commission, Mr. Volpe, that insofar as radioisotopes are concerned, the Commission has unlimited authority to ship them abroad any place where their judgment directs they should go, even though it is clearly understood they shall be used in industrial processes and that there is no limitation of any type or character upon the Commission as to what countries they may be shipped to, in what amounts they may be shipped, and in the fact that they are clearly stated as being used for industrial purposes?

Now, I ask the question because, while I do not agree that the law gives you that authority, in may be that there is a loophole in the law that will need legislation to close up. I want to find out from you, as counsel of this Commission, how far you believe your authority goes in the shipment, not for medical purposes but for industrial purposes, of isotopes.

Mr. VOLPE. Senator, I would answer that in this way: I do not believe that the Commission has unlimited authority. There are many provisions in the law which define the Commission's authority.

Senator KNOWLAND. I am speaking of the shipment of isotopes now.

Mr. VOLPE. The Commission under the act is required to exercise its authority in such a way as to further the common defense and security of the United States, and the paramount objective of everything the Commission does is the common defense and security of the country.

Now this, of course, requires judgment; and it is my understanding that the Commission has exercised this judgment on the basis of the best scientific and technical advice they could possibly get.

With the question of whether or not these isotopes are used for industrial purposes, it is not my understanding from what I have heard through the testimony or the discussions by scientific and technical people that these isotopes are being used for industrial purposes.

It is my understanding that they are being used for research purposes. Now, it may be true, but this is something which I personally believe scientists and technical people should be heard on, it may be true that ultimately these research activities may lead to industrial techniques and discoveries at some future date in other fields such as steel and iron and planes and jet propulsion, and so on, but this is quite far removed from atomic energy itself.

The CHAIRMAN. At any rate, Mr. Volpe, the question as to the legal power of the Commission has never been raised until this time and, as I understand it, Senator Hickenlooper's point is not a quarrel with the shipment of radioisotopes, which he said he specifically approved of, but rather—

Senator HICKENLOOPER. I did not go that far.

The CHAIRMAN. But rather, the specific case.

Senator HICKENLOOPER. I am not raising the issue of whether I approve or do not approve.

The CHAIRMAN. I thought you stated earlier you had no objection to the radioisotope program or shipment abroad, except in the particular case.

Senator HICKENLOOPER. I said I was not raising objection, and I do not want to be understood as either approving or disapproving. I want to keep that issue out of my point.

The CHAIRMAN. I am sorry if I misunderstood you.

Mr. SMYTH. May I make a statement? It seems to me Mr. Volpe summed up very clearly what I was trying to explain, and I would reaffirm my statement that I would not consider radioactive isotopes to be atomic energy. I feel they are not within the definition.

Mr. COLE. May I ask a question?

The CHAIRMAN. Mr. Cole.

Mr. COLE. Do you consider a radioactive isotope as being a form of energy released in the course of or as a result of nuclear fission?

Mr. SMYTH. No.

Mr. COLE. Why? Is that because it might be produced in some other fashion?

Mr. SMYTH. It can be produced in another fashion.

Mr. COLE. But if it is produced in this fashion, then it is atomic—

Mr. SMYTH. Heat is also produced in this fashion, and I cannot be convinced that heat is atomic energy per se.

Mr. HINSHAW. Mr. Chairman, I believe I am correct in stating—and Dr. Smyth can correct me—that the fast neutrons that are released in an atomic pile are very much the same as the fast neutrons that are speeded up by a cyclotron, are they not?

Mr. SMYTH. Neutrons are not directly speeded up in a cyclotron. You can produce neutrons by having the particles that are speeded up in a cyclotron impinge on various targets.

Mr. HINSHAW. In other words, the type of energy produced in the cyclotron for the purpose of producing isotopes is very similar to the type of energy which produces those same isotopes in a pile, is it not?

Mr. SMYTH. That is correct.

The CHAIRMAN. Now, Mr. Strauss.

#### **STATEMENT OF LEWIS L. STRAUSS, COMMISSIONER, UNITED STATES ATOMIC ENERGY COMMISSION**

The CHAIRMAN. Mr. Strauss, we would like to adjourn at 1:30, but do not feel that we are rushing you. If it is necessary for you to testify beyond 1:30, we will give you a further opportunity at the next session.

Mr. STRAUSS. I am here to respond to questions.

Senator KNOWLAND. Admiral, I would like to ask this question: I have understood from the statement made by Senator Hickenlooper earlier that on this question of the shipments or at least of some shipments of isotopes the vote of the Commission was 4 to 1. Is it correct that you voted in the negative on that?

Mr. STRAUSS. Senator Knowland, that vote occurred in August of 1947. It was the first of a dozen or so times that I found myself in disagreement with my fellow Commissioners.

It was the occasion of a good deal of grief to me, but I feel and I think they understood that I believed and they believed that the function of a five-man commission as opposed to, let us say, the idea of a single administrator was the idea of the Congress in obtaining divergent points of view.

I felt strongly on the subject, and I felt it my duty to maintain it.

Senator KNOWLAND. Could you give to the committee—because I think this is important, and we feel we have need of education on it, since it is relatively new—could you give the committee your reasons for believing that it was a mistake in policy for the shipment of isotopes and with particular reference to isotopes that might be used for industrial purposes?

Mr. STRAUSS. I am talking against time.

The CHAIRMAN. No, you are not, Admiral. You go ahead and give your story. We will recess at 1:30 and you can take it up tomorrow.

Mr. STRAUSS. Thank you, Mr. Chairman.

It seemed to me that the provisions of section 10 (a) (1) of the act and another sentence somewhat shorter, but which I cannot identify at the moment from memory, referred not specifically or particularly to atomic energy as such but to atomic energy information; and, based upon that construction, which was not only my own but, I think, in other instances, has been the Commission's, we have restricted the export of, let us say, certain documents or certain designs or even certain instruments to other countries.

There are, in fact, isotopes which we do not export at all, and there is no export, let us say, to Russia of isotopes. If they are not instruments which might be used adversely to our interests, there would be no purpose in arresting the export of isotopes to Russia any more than shoes.

I was, naturally, much concerned about the statement of the General Advisory Committee, for the members of which distinguished body I have unbounded respect, but as I read it and listened to it, I think that it is clear that they reaffirmed that their original recommendations constitute sound policy. I jotted that down as it was read this morning.

That does not have any particular reference, it seems to me, to the case of the export of a radioactive pile-produced isotope to the military establishment of another country.

The point has been made and was made in August 1947 by those of us who discussed it that certain isotopes could be produced in cyclotrons, and that they are produced also in piles which may be in other countries.

In August 1947, when I voted on this subject, there were, to the best of our knowledge, no piles in any foreign country with the exception of one at Chalk River, as to which we had some very special relations which you would not wish to be made a part of this particular record, and isotopes which can be produced by cyclotrons, because of the peculiar characteristics, which differentiate a high-energy electrical machine such as a cyclotron and a pile, are of totally different orders of magnitude.

That is to say, it will take in some cases thousands of cyclotron years—a cyclotron operating thousands of years—to produce as much of a certain specific isotope as can be produced in our piles in very large

quantities in a time of a totally different order, and the amounts of isotopes that are ordinarily produced in cyclotrons are submicroscopic.

As to whether it is the policy of the Government to assist a friendly European nation in its military research, I am not qualified to speak.

I felt and I feel that it is not a function of the Atomic Energy Commission, that there are other agencies of Government that should deal with that, and independent action by the Commission oversteps its statutory provisions.

I think I should also conclude by saying that the use of radium in place of radioactive iron in research, as is indicated by the Norwegian Military Establishment, is not indicated. The reason for radioactive iron in such an experiment is that because iron and steel are the two materials which are involved and the radioactive iron is used as a tracer in that particular experiment. Radium would be of no value in it whatever, as far as I have been able to ascertain upon investigation.

I could go to considerable length as to my reasons, which were expressed in August of 1947, for my deferential dissent from this decision, but they are well expressed in the minutes of the Commission.

I might only say that one of the things that I feared and anticipated—and that is in the minutes—is that some of these isotopes might be used in metallurgical research for the specific purpose for which this is, I assume, to be dedicated. I do not want to imply that there was any very high grade prophecy involved there, and I have more mistakes to my credit than hits.

Senator KNOWLAND. I do not want to pursue this matter, Mr. Chairman, because you said you wanted to adjourn at 1:30, but it is something we might want to explore further at a later date.

The CHAIRMAN. We have 2 or 3 minutes. Mr. Durham?

Mr. DURHAM. I would like for the admiral to give us his educational background.

Mr. STRAUSS. Mr. Durham, that is a matter of some embarrassment to me. I haven't any. I have a common-school education. I have some honorary degrees, but I take it that it is not worth while to cite them. I also occupy—quite recently—the position of president of the board of trustees of an institution of higher learning, and I am a director on the board of four colleges, which directorship I was permitted to retain when I resigned all my business connections; but educational pretensions I have none.

Mr. DURHAM. You raised the question in my mind because you expressed so many scientific opinions.

Mr. STRAUSS. If I gave the impression that I had some technical competence, I would like to disavow it.

Senator HICKENLOOPER. I might suggest to Admiral Strauss that I believe for many years he has been deeply interested in what amounts to charitable activities in the public interest on his part in cancer research and in many fields of biological research where he has supported much activity along that line.

Mr. DURHAM. I commend him for that.

The CHAIRMAN. Mr. Price?

Mr. PRICE. I am certain that no one questions Admiral Strauss in any form. As a matter of fact, he need suffer no embarrassment. I think he is to be commended for his record. This, of course, is a five-man Commission and, naturally, there was no compulsion on the part of any Commissioner to commit himself in advance as to how he was

going to perform on this Commission, except in what he felt to be the best interests of the country.

Many times during your discussions you probably were in disagreement, and if you were not, you probably would not be a good Commission. What was the vote on this particular issue?

Mr. STRAUSS. The vote on this particular issue was 4 to 1. I would like to repeat there are no four men for whom I have a higher regard or for whose sincerity I have a higher regard than the four who participated on the Commission with me.

Mr. PRICE. I think they will share the high regard for you also, and I know this committee does.

I would like to ask this, since this hearing is directed against the Chairman of the Commission—the Commission itself is not on trial, as I understand it, the Chairman is on trial: Has there ever been any evidence in your experience on this Commission where the Chairman used coercion to compel other members of the Commission, to compel their views to conform with his own?

Mr. STRAUSS. I could only speak from personal experience. He has never used any coercion on me.

Mr. PRICE. That is about all I have to say.

Senator MILLIKIN. So the witness will not go away disheartened at his lack of formal education, I would like to remind him that he is in the company of Edison and Burbank.

Mr. STRAUSS. I hope those gentlemen will take it all right.

Mr. DURHAM. I did not mean to embarrass the admiral at all.

Mr. STRAUSS. There is no embarrassment.

Mr. COLE. At the beginning of these hearings on Monday, I think it was, I inquired of Mr. Lilienthal the number of times that there had been lack of unanimity. I was going to say dissension, but rather I would say lack of unanimity in the decisions of the Commission. As I remember, he responded that there were perhaps 5 out of 500 decisions. In your statement this morning you said that it had occurred in a dozen or so instances. I do not want the answer nor the explanation at the moment, but I would like to have you be prepared or tell me now, if you can, how many instances there were of lack of unanimity.

Mr. STRAUSS. May I supply that for the record?

Mr. COLE. If you prefer to later, and also be in a position to explain the nature of the subjects over which there was disagreement and your reasons for taking the position that you did.

Mr. STRAUSS. Mr. Cole, I think some of them could only be broached in executive session.

Mr. COLE. I realize that.

The CHAIRMAN. The committee will stand in recess until 10:30 tomorrow morning for an open hearing.

(Whereupon, at 1:35 p. m., the joint committee recessed to reconvene at 10:30 a. m. on Thursday, June 9, 1949.)

## JOINT COMMITTEE ON ATOMIC ENERGY

(Created pursuant to Public Law 585, 79th Cong.)

BRIEN McMAHON, Connecticut, *Chairman*

CARL T. DURHAM, North Carolina, *Vice Chairman*

RICHARD B. RUSSELL, Georgia

EDWIN C. JOHNSON, Colorado

TOM CONNALLY, Texas

MILLARD E. TYDINGS, Maryland

BOURKE B. HICKENLOOPER, Iowa

ARTHUR H. VANDENBERG, Michigan

EUGENE D. MILLIKIN, Colorado

WILLIAM F. KNOWLAND, California

CHET HOLIFIELD, California

MELVIN PRICE, Illinois

PAUL J. KILDAY, Texas

HENRY M. JACKSON, Washington

W. STERLING COLE, New York

CHARLES H. ELSTON, Ohio

CARL HINSHAW, California

JAMES E. VAN ZANDT, Pennsylvania

WILLIAM L. BORDEN, *Executive Director*

HAROLD BERGMAN, *Deputy Director*

WILLIAM J. BERGIN, *Editor*

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

THURSDAY, JUNE 9, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment, at 10:30 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon, Representative Durham (vice chairman); Senators Vandenberg, Millikin, Knowland, and Hickenlooper; Representatives Holifield, Price, Jackson, Cole, Elston, and Van Zandt.

Also present: David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Gordon E. Dean, Commissioner; and Henry D. Smyth, Commissioner; Lewis L. Strauss, Commissioner; Carroll L. Wilson, General Manager; Carlton Shugg, Deputy General Manager; Joseph Volpe, Jr., General Counsel; Frances Henderson, Assistant to the Chairman; Roy B. Snapp, Secretary to Commission; Philip J. Farley, Office of the Secretary to the Commission; Everett Hollis and Bennett Boskey, of the Office of the General Counsel; Dr. Shields Warren, Director, Division of Biology and Medicine; William S. Trueheart, Office of the Director of Intelligence; Morse Salisbury, Director, and Rodney Southwick, Division of Public and Technical Information Service; Lt. Col. Kenneth E. Fields, Division of Military Application; Fletcher Waller, Director, Division of Organization and Personnel; Walter J. Williams, Director, and Frederick Warren, Division of Production; Dr. Ralph Johnson, Associate Director, Division of Research; Francis Hammack, Acting Director, C. A. Rolander, Edward Brosnan, Robert A. Havnie, and Bruce Uthus, Division of Security; all of the United States Atomic Energy Commission.

The CHAIRMAN. The committee will come to order. Will the Commissioners take their accustomed places, please?

Mr. Lilienthal, because we restricted Commissioner Strauss yesterday and because we had to adjourn the meeting, we will now hear from Commissioner Strauss as to the remainder of his statement on the shipment of isotopes.

Mr. LILIENTHAL. Mr. Chairman, may I make this comment? In view of the reference to dissent, may I read into the record the views of the four members of the Commission—Robert Bacher, William Waymack, Sumner Pike, and myself—on this matter? It is rather unusual to start with a dissent rather than with the majority view.

The CHAIRMAN. We really did not start with the dissent, Mr. Lilienthal. We started with a general statement from you and then

Commissioner Strauss was called to explain why he disagreed with the policy. And now he has had only 10 minutes within which to do that. It seems to the chairman of the committee that the only fair thing to do, rather than cut him off and rather than to make the case, well, shall I say, choppy, it would be better if Commissioner Strauss were allowed to present his full view on it.

We have had testimony from you and from Dr. Smyth. Later we will be very happy to have the statement read into the record.

Mr. LILIENTHAL. I simply want to suggest, Mr. Chairman, that in view of the fact that the charges are directed against the Commission and particularly against me that to have dissenting views put in before the views of the Commission itself does seem a little unusual, but I will abide by the decision.

The CHAIRMAN. We have had the views of the majority from Dr. Smyth, although I realize he was not on the Commission.

Mr. LILIENTHAL. No; he was not.

The CHAIRMAN. It happens that I agree with the majority of the Commission in the shipment of foreign isotopes for many reasons, which I will go into at the proper time. But we have had a presentation, perhaps not a full one, and certainly the Commission is entitled, the four members, to have their views presented.

However, I believe that Admiral Strauss, having been interrupted when he was in the middle of his statement, it would be only fair to permit him to finish. If the committee could have sat yesterday until 2 o'clock, he probably would have finished his presentation.

Mr. JACKSON. Mr. Chairman.

The CHAIRMAN. Mr. Jackson.

Mr. JACKSON. I would like to make a brief comment. I have been attending these meetings now since they opened a little over a week ago. We started out with the charge that the Atomic Energy Commission was guilty of incredible mismanagement. I had understood that we would have a bill of particulars to these charges. When the time came, we did not get a bill of particulars or the list of charges. We started out with a hearing.

The members of the Commission were called up here and not advised as to what the charges were other than a blanket charge of incredible mismanagement. The members of the committee, the triers of the facts, were not advised as to what the charges were and have not been advised up until this time.

We meet every day and we do not know whether we are going to talk about construction projects at the Argonne National Laboratory or if we are going all the way to the fiords of Norway, and it seems to me that the people who are the triers of the facts here ought at least to have an opportunity of knowing the agenda for the following day. I think it is only fair that members of the Commission be advised as to the topic to be discussed.

I may be wrong about this, but it is my understanding or recollection that each morning at about 9 o'clock the Commission is advised as to what is going to be discussed.

The result is—if that is true, I do not know—the result is they come up before this committee not knowing what is going to come up. An example of it occurred yesterday when we discussed three different topics, the last one being isotopes, which the Commission did not

have an opportunity at all to present any specific information on because they had not been advised of the charges.

Now, I have served in Congress five terms, but I must confess this is the first time I have been on a committee where at least members of the committee have not had an opportunity to know what the specific charges that are being investigated are. Certainly, I think in fairness and for orderly procedure, there should be some sort of agenda arranged and worked out. I think we ought to know what we are going to discuss tomorrow or the following day.

I think that it makes us look a bit ludicrous, to say the least, to come in here every day or whenever we have a committee hearing and call the Commission up and start asking questions. It is certainly contrary to every concept and precept of Anglo-Saxon law, and the courts certainly go a long way to make sure that those who are accused of serious charges are given opportunity to be heard and that all relevant testimony may be presented.

I think the Coplon trial could be mentioned. Yesterday the decision of Judge Reeves is indicative of the sacredness of a fair and decent trial for every one.

I must confess that I am not at all satisfied with the procedure that we are following here and, as I have protested on previous occasions, I want to lodge my protest again as to the way the facts are being presented in this case.

Senator HICKENLOOPER. Mr. Chairman.

The CHAIRMAN. Senator Hickenlooper.

Senator HICKENLOOPER. May I say I undertook to present in an orderly fashion—the committee knew that I attempted to present in an orderly fashion the matter of security clearance procedure. I was immediately blocked on that after the first case by a very proper question by the committee as to what method of procedure they thought we should go into.

I am still blocked because no decision has been made on that score yet. As a result, the procedural methods and the investigation of this matter have been completely turned over.

Yesterday I had not intended to go into this matter, but a hearing was set—that is, the matters we went into yesterday—on that day I had not intended to go into. Procedural matters were upset. I was not quite fully prepared or as adequately prepared as I would have liked to have been myself.

I suggest the matter of clearance procedure is a vital matter in this, and it has to be determined. I believe the chairman is trying to be diligent in getting some kind of ground upon which we can proceed, but I do hope that that particular question can be resolved immediately. If so, there will be no question about my being able to proceed very shortly.

The CHAIRMAN. I just want to indorse the statement as to the diligence of the chairman. He has done little else for the last 3 or 4 days except to try to work out this very troublesome matter. We have an executive meeting scheduled for this afternoon, and I do hope, Senator, that we are going to be able to come to a final conclusion.

Mr. JACKSON. I want to say to the Senator that I am directing my complaint primarily at the procedure that is being followed in this case. Now, the Senator from Iowa, I think, has reference to case A, and certainly the public record discloses my views on that. We have

nothing to hide in any of these matters, and I think if we are going to get the truth, we should have all the facts before the committee; but I am complaining about the fact that we have not received a bill of particulars as to the specific charges against the Commission.

The first day the testimony related to turn-over in personnel, which is common to any department. The testimony of the second day related to the clearance program, without any specific charges. They are just general allegations.

I think the time has come—when a complaint or an information is filed in an ordinary court of law, it is usually followed up by evidence.

That is my complaint. I would like to find out what the charges are.

The CHAIRMAN. I might say that before we finish this investigation, I only reiterate what I said when it opened: It is not any persecution, it is not any attempt for whitewash; it is going to be a fair investigation, as far as I can keep it a fair investigation, giving both protagonists the fullest opportunity to present their views.

The Chairman certainly has no intention of doing anything else, and I know the Congressman from Washington appreciates that fact.

Mr. JACKSON. The chairman has been very fair. I do not think he could be any fairer with 18 members of the committee probably sometimes wanting to ask questions at the same time. He has a difficult task, and he has been most fair, and I am not complaining about the way the chairman has conducted the hearing. I think he has been very fair. I merely make my suggestions in the hope that we can have some orderly procedure rather than sort of a carnival of confusion here.

At least, it seems that way to me, since we have testimony running from laboratories to isotopes to personnel problems all in one day.

Mr. LILIENTHAL. Mr. Chairman, as I leave the table, may I make this comment in respect to Congressman Jackson's remarks: There is outstanding as a result of yesterday's impromptu discussions, as far as we were concerned, since we were not advised in advance as to what was to be taken up, a problem, a very distressing kind of indirect accusation against a friendly country, the country of Norway; and we would hope this morning that we will be able to explore that further and clear that up.

The CHAIRMAN. You certainly will, just as soon as Commissioner Strauss gets through with his statement, which was interrupted. I expect that you will come back and make a statement.

Commissioner Strauss, will you please take the stand?

#### STATEMENT OF LEWIS L. STRAUSS, COMMISSIONER, UNITED STATES ATOMIC ENERGY COMMISSION

Senator HICKENLOOPER. Do you have a statement in continuation of your discussion yesterday?

Mr. STRAUSS. Yes, Senator, I do.

Senator HICKENLOOPER. Would you care to proceed with it, and then maybe I can question you or some members can question you later.

Mr. STRAUSS. I would appreciate the opportunity.

Senator HICKENLOOPER. Do you have a copy of your statement?

Mr. STRAUSS. I have a reading copy and I have been told that other copies will be provided.

The CHAIRMAN. You have a statement on this matter, Admiral?

Mr. STRAUSS. I have, Senator.

The CHAIRMAN. Proceed.

Mr. STRAUSS. On yesterday, when I was called to the stand near the close of the hearing, there were available only a few minutes for me to respond to questions dealing with the export to foreign countries of radioactive isotopes produced in the atomic piles of the Commission. As has been testified in the course of recent hearings before the Subcommittee of the Senate Appropriations Committee, there had been a dissent from this proposal. I was the dissenter.

I should like to repeat that neither then nor at any time past was there any personal friction nor any question in my mind as to the devotion, loyalty, and integrity of my colleagues in connection with this subject, or in any of the matters dealing with national security where I have been compelled to differ from the majority point of view. When the Congress placed the control of atomic energy in a body of 5 men, rather than establishing a single administrator, it must have been for the purpose of obtaining points of view which would not necessarily be uniform and, while it has been a matter of considerable unhappiness to me to find myself from time to time out of phase with men whom I respect, I have, nevertheless, believed it my clear duty to support and maintain my principle in those dissents where I felt that I was right and they were wrong.

Mr. Justice Holmes, a patron of my youth, long ago lifted dissent from the area of apologetics.

The instance in question was the second split vote in the Commission and the circumstances are as follows. I shall try to be as brief as I can.

Shortly after the Commission took office, representations were made to us to permit the export of radioactive isotopes made in the pile at Oak Ridge, to foreign countries for medical therapy and for medical and biological research. The arguments were appealing. I was somewhat concerned by the fact that the radioisotope is a tool of possibilities as yet unplumbed; that certain of them can be used for military as well as for peaceful research; and that control of radioisotopes once they had left our shores presented insuperable difficulties.

I was mainly concerned, however, by the fact that the McMahon Act under which the Commission functions provides first, in its declaration of policy, the information concerning the "practical industrial applications of atomic energy" are to be shared and disseminated "as soon as effective and enforceable safeguards, against its use for destructive purposes can be devised." And there is, of course, the familiar section 10A (1) of the McMahon Act which states "That until Congress declares by joint resolution that effective and enforceable safeguards against the use of atomic energy for destructive purposes have been established, there shall be no exchange of information with other nations with respect to the use of atomic energy for industrial purposes." That is the end of that section.

The legal question may not be so important as in this case what seemed to me to be prudence and judgment.

In August 1947, I apprehended what today I know to be a fact, that radioactive isotopes would be increasingly useful in providing information not only for atomic energy research but also in a vast field of industrial and military applications not involved in production of the atomic bomb itself. Since the hearing yesterday morning, I have reviewed the records of that meeting of the Commission on

August 19, 1947, at which the subject of the export of radioisotopes was formally settled.

Although I should be quoting only myself, there may be some impropriety in reproducing any part of minutes of the Commission as they have not thus far been supplied to the committee and I am, therefore, paraphrasing the statement recorded by the secretary as expressing the views which I voiced at that time. And I refer to myself, therefore, in the third person.

Mr. Straus is quoted as saying that he was apparently the only member opposed to affirmative action at this time and added that, when some weeks ago he had realized that fact, he had attempted unsuccessfully to conform his thinking with his colleagues.

He said that he was compelled to conclude that the burden of proof rested upon those who wished to see radioactive isotopes exported. He summarized the reasons which had been advanced on behalf of the argument in favor of export, these being as follows:

(1) That the Commission possesses the legal right to take such action;

(2) That it was necessary in order to prevent scientists abroad from becoming disaffected in their attitude toward the United States;

(3) That there was little likelihood that radioisotopes which were exported could possibly be used in research and other activities that would result in any military advantage; and finally

(4) That we would be divulging no knowledge that would not eventually be discovered by other nations in any case.

The minutes go on to record that Mr. Strauss stated that the record would not sustain the thesis that foreign scientists were all well disposed toward America. He said that many had worked, or had been compelled to work for the dictatorships of both the "right" and the "left," and that in general in political matters scientists were as divergent in their views as less gifted men. He held that this indicated that until satisfactory international control of atomic energy is secured, the United States should take no steps to assist science in any unfriendly nation. He expressed doubt that it would be possible to acquire the good will of foreign scientists on any permanent basis by authorizing the distribution of isotopes abroad.

As to the contention that the export of radioactive isotopes would merely make available what foreign countries would eventually obtain by means of their existing cyclotrons or the cyclotrons which could be built, Mr. Strauss pointed out that such an argument disregarded the time factor; that cyclotrons produced microscopic quantities of radioactive isotopes and that to obtain amounts comparable to a few days' production of the Oak Ridge pile would require very many years of cyclotron operation.

I might interpolate that in 1947 there were, so far as we knew, no atomic piles overseas.

Commenting upon the conditions proposed to safeguard the export of radioisotopes, Mr. Strauss expressed doubt that the proposed conditions could effectively prevent their use for unfriendly purposes or their divergence to unfriendly hands. The minutes continue to the general effect that Mr. Strauss stated that he never contended that the isotopes in question could be used by other countries to produce atomic bombs but he felt that they could be most useful as tools (1) in bio-

logical research (at this point I remember citing the possible mutation of agents for use in biological warfare); (2) in petroleum chemistry (and here I recall citing their employment in cracking processes and calling attention to the importance of petroleum in modern warfare); and (3) in metallurgical research (and in that connection I mentioned the race in which all nations with military establishments are engaged in order to find alloys which could withstand the intensities of heat and erosion that are the two great metallurgical hurdles in the design of jet and rocket motors).

The report continues that Mr. Strauss said that he was not competent to pass on the legal aspects of the problem but that the language in the act prohibiting the exchange of information with other nations for the use of atomic energy for "industrial purposes" seemed clear to his lay mind and that this lesser prohibition, he thought, must obviously presume the greater prohibition of possible military uses.

While having no other course than to accept the opinion of the general counsel as to the legality of the proposed action, Mr. Strauss concluded by calling attention to the fact that during the Senate debate on confirmation of the Commission, indeed on its last day, the issue was crystallized by the fact that the President pro tempore of the Senate took the floor himself and, in reply to an allegation made earlier in the debate that the Commission would give away secrets to foreign countries, had reminded Members of the Senate that the Commission could not evade the many mandates of the act in this matter; that these mandates would last until there was international control, and that there was little prospect for international control before the 18 months for which the Commissioners were to be confirmed would expire. That was a prophetic statement.

For all these reasons Mr. Strauss expressed his belief that we should not approve the plan as then presented for the distribution of radioisotopes.

During the Commission discussion an argument was advanced to the effect that the foreign distribution of radioisotopes was a relatively small matter compared to such matters as the United States export of electric generators for installation at the Dnieperstroy Dam in Russia. Mr. Strauss replied that the Commission had no responsibility for the export of generators, although he felt and said that the Government agencies which had such jurisdiction should exercise it. Whereas, on the other hand, there is a law which the Atomic Energy Commission is charged with executing which provides for control in our own field of activity and where obviously we have the primary responsibility. That is enough for that meeting.

Almost 2 years have elapsed since this meeting. I have not altered the views which I then entertained and the intervening events, as a matter of fact, have fortified them.

The subsequent history of this decision is brief. A press release was issued by the Commission in which it was stated:

Foreign governments whose research workers request radioactive isotopes must first agree to permit qualified scientists *irrespective of nationality* [the emphasis is mine] to visit the installations where the materials will be used to obtain information freely.

At the conclusion of the August 1947 meeting of the Commission, it was agreed that the Commission's recommendations and reasons for approving the foreign distribution of radioisotopes would be for-

warded to the Department of State for review and that, as a mark of consideration to me by my colleagues, the reasons which had been advanced against such action would also be presented. The Commission's arguments and mine appear in the following paragraph of a letter to the Secretary of State, which has subsequently been declassified by the Commission:

The Commission is of the opinion that the type of radioisotopes involved, in the quantities and under the conditions prescribed, will not contribute to atomic energy research in other countries except to the extent that radioisotopes are tools which can contribute to any nation's general scientific program. The view may be taken, therefore, that to this extent their distribution is detrimental to this country's welfare. It is the Commission's judgment, however, that the advantages the United States will gain from taking steps at this time to make available the use of radioisotopes for *humanitarian purposes* outweigh this consideration.

The emphasis on the words "humanitarian purposes" is my own.

The reply from the Acting Secretary of State concludes with the following words in a letter which the Commission has also declassified.

The CHAIRMAN. Who was the Acting Secretary?

Mr. STRAUSS. I am not sure. I quote:

Based on your assurance that this offer on our part does not prejudice our national security and in view of the checks and safeguards set up in the distribution scheme as you have outlined in the enclosure to your letter, the Department of State sees no objection from the point of view of foreign policy.

I called attention to the fact that this letter appeared to have been written under some misapprehension since it assumed an unqualified assurance that there was no prejudice involved to our national security; whereas that, of course, was a matter of opinion.

The views on this subject of the distinguished General Advisory Committee to the Commission have been cited in the course of testimony yesterday. The General Advisory Committee is composed of outstanding scientists who are devoted to their country and who are likewise in another sense devoted to the established scientific tradition which endorses the widest dissemination of knowledge in time of peace. None of them, I feel sure, questioned the moratorium on that principle during the years of the hot war.

The question of whether indiscriminate dissemination of knowledge on atomic energy ought to be made during the period of a cold war is the real point at issue. In any case, it is not accurate to imply that the General Advisory Committee has approved the export of radioisotopes produced in our atomic piles to the military establishment of any foreign country. Their statement to the Commission, dated only June 6 last, I do not read as such an endorsement. The pertinent part of that statement is as follows:

With regard to the isotopes distribution, we have reexamined in detail the statement made by us at our fourth meeting (May 30-June 1, 1947). Despite the criticisms that have been voiced to the Commission's policy, we wish to reaffirm our conviction that these recommendations constituted sound policy.

The recommendation of the General Advisory Committee at their fourth meeting, which occurred between May 30 and June 1, 1947, which the foregoing statement reaffirms includes the following:

The conditions under which these materials will be sold at cost to an individual scientific laboratory are such as to insure that the sole purpose for which they will be used is for research or medical treatment.

And further that—

Thus diversion of the material to secret or military research will be difficult and any continued diversion of this sort will be impossible.

I, therefore, feel it is unfair to the General Advisory Committee to construe their current statement as an endorsement of the action of the Commission in exporting a radioisotope to a research division of the Norwegian Military Establishment in April.

This does not appear in my prepared statement, but I certainly did not wish to cast any opprobrium or criticism at the Norwegian Government in their position. I think I should have asked for this myself.

The purpose for which this radioisotope was requested was to investigate the flow of iron in steel at high temperatures. It has been stated here that this could very well be basic research not at all related to any military end result. It seems to me that the request for this material by a military establishment has to be judged upon its face. And this is quite apart from the fact that it also seems to me to run contrary to the mandate in the act.

As to the use of such an isotope, what the use might be, let me briefly read from the New York Times of January 3, this year, which quotes Dr. William Shoupp, manager of the electronics and nuclear physics department of the Westinghouse Laboratories, as stating:

Isotopes also aid our scientists to find out what happens on the surface of a metal or alloy when it is exposed to extremely high temperatures. This information is vital to the development of new alloys for gas turbines, jet engines, and other high-temperature apparatus.

In a memorandum which I prepared for my colleagues in September 1947, about a month after the dissenting vote, and in which I asked for reconsideration of the decision, I proposed that qualified researchers from countries which have agreed to support the United States proposal for international control of atomic energy be made welcome in our institutions to use the radioisotopes on the announced lists to further their medical and biological studies and that, in cases where isotopes were urgently required abroad for medical treatment of sick people, they be provided in all locations where supervision could be supplied from the staffs of our consulates.

In closing, I should like to repeat that this dissenting vote represents a difference with my colleagues that I consider and that I hope is within the area of divergence which men may have without impairing their respect for one another. My colleagues think they are right; I think they are wrong. The Congress will have to decide. These are not ordinary times, and the law which we are sworn to administer is one which we simply construe differently.

On yesterday, before I left the stand, Mr. Cole asked me to supply for the record data concerning the number of times that there was lack of unanimity in the Commission. Chairman Lillienthal has testified at a previous session that there was only one Commissioner who had dissented and, therefore, it was not necessary for me to look up the votes of any of my colleagues except myself, since my recollection confirmed that the Commission has always been unanimous except in those cases when I found myself the minority.

The Secretary of the Commission has informed me that, in the Commission minutes which have been approved to date, there are eleven dissenting votes and one additional in a minute which has not yet

been circulated to the Commission. There are, of course, several other occasions on which a difference of opinion has been voiced or was implicit to my colleagues but which for one reason or another have not entailed a vote.

Mr. PRICE. Out of how many decisions?

Mr. STRAUSS. I do not know. Mr. Lilienthal said 500, and I am sure that was probably the right figure. I did not check as to that. Mr. Cole did not raise that question with me.

All of these dissents deal with aspects of security and national defense. I do not recall any of them that run to operational matters, and I believe they are questionable subjects for an open hearing.

Mr. COLE. All of them?

Mr. STRAUSS. That is my belief, sir.

If I may be pardoned a personal reference, I would like to anticipate some criticism by stating that I am not an isolationist and have never been. As far back as 1916—it seems a very long time ago to me—I began my interest in the welfare of the human beings irrespective of their nationality. I served in the Belgian, French, German, Austrian, and Russian Relief. I organized the relief fund for Finland when that country was attacked by Russia in 1939, and I came to the Atomic Energy Commission after a long, active, and somewhat poignant personal interest in radiation as a possible key to the understanding and cure of cancer. I have brought this personal note into my remarks because I would not be thought indifferent to human welfare by those who do not know me. National security, however, as long as I am a member of this Commission, must be my paramount responsibility.

Thank you.

The CHAIRMAN. Admiral, was this matter cleared with the Military Liaison Committee?

Mr. STRAUSS. Senator, may I say that I think that, as a result of an oversight and an inadvertence, it was not; but I am satisfied that there was no intent not to clear it, and I am satisfied, furthermore, that individuals on the Military Liaison Committee were fully aware of the fact that the issue was before the Commission and what the action of the Commission would be likely to be.

The CHAIRMAN. Mr. Durham?

Mr. Durham. I have no questions, Mr. Chairman.

The CHAIRMAN. Senator Vandenberg?

Senator VANDENBERG. No questions.

The CHAIRMAN. Mr. Holifield is not here. Senator Millikin?

Senator MILLIKIN. No questions.

The CHAIRMAN. Mr. Price?

Mr. PRICE. No questions.

The CHAIRMAN. Senator Knowland?

Senator KNOWLAND. Just one question, Admiral.

In regard to the contract that we have with the nations to which the isotopes are shipped, I understood you to say that there was a provision that inspection could be had by scientists irrespective of nationality. Is that correct?

Mr. STRAUSS. That is correct, sir. That is a brief statement of a section in our regulations, which perhaps might be submitted.

Senator KNOWLAND. Could we have the copy of those instructions or regulations that are issued made available to the committee?

(The information requested is marked "Exhibit 12" and will be found in the appendix.)

Mr. STRAUSS. I am sure that that can be done, Senator.

Senator KNOWLAND. That is all.

The CHAIRMAN. Mr. Price has indicated he now has a question.

Mr. PRICE. I would just like to ask: How long did the Commission have the question of the isotope distribution before it, before it arrived at a decision?

Mr. STRAUSS. I would not have been able to answer that question yesterday, but I sat up last night reading the record, and the earliest memoranda are almost coeval with the formation of the Commission. They date with the taking over of the properties of the Commission. They date from January 1947; and I think it fair, therefore, to say that the matter was in the Commission for a period of 6 to 7 months and was under active discussion for a period of 1 to 2 months.

Mr. PRICE. During the course of which the views of the General Advisory Committee were taken into consideration?

Mr. STRAUSS. They were, and I am sure they weighed very heavily with the Commission, as they properly should.

Mr. PRICE. That is all I have.

The CHAIRMAN. Mr. Cole?

Mr. COLE. Yes.

Admiral Strauss, I judge from your statement, in which you express considerable personal concern over the fact that you had to differ with your colleagues, it indicates that it was only in the extreme cases or in those of such an important nature that in your opinion justified your expressing a dissent; is that correct?

Mr. STRAUSS. No, Mr. Cole. I think that my assents when they were given were wholehearted and that it was a concurrence without reservation.

Mr. COLE. Is it correct that there is a tendency on your part as well as the other members of the Commission to concur in decisions?

Mr. STRAUSS. I think when five men get together, unless there is an earnest attempt made to reconcile divergent points of view, they do not last as a group very long; and I am sure that my colleagues have earnestly tried on those occasions when I differed to see, first, whether they could not convince me and, then, whether there was merit in the position which I had taken to which they could subscribe.

Mr. COLE. Then it is as a general proposition true that the Commissioners have tried to reach an agreement?

Mr. STRAUSS. It is true, sir.

Mr. COLE. With respect to the problems that confront them, so that they can be united and not have to face divisions.

Mr. STRAUSS. That is true.

Mr. COLE. That being so, can it not be said with reason that it has been the unusual and the extreme instance when division was found to be necessary?

Mr. STRAUSS. That is true.

Mr. COLE. Have there been any other instances in the application for and the shipment of isotopes which the Commission has acted on favorably which would support your fears except the one to Norway?

Mr. STRAUSS. That is the only instance, that is the first instance and a very recent instance of the application for a radioactive isotope directly from a military establishment. There have been other in-

stances when I felt it was prudent to assume that use other than that requested might be made of the isotope.

Mr. COLE. Perhaps the question is not proper to place to you, but if the chairman has no objection, would you mind explaining the procedures through which these applications for isotopes are confirmed or approved? Does the Commission itself act on each application?

Mr. STRAUSS. No, Mr. Cole. In respect of certain countries these applications are handled in what is described as "a routine manner" by the staff of the Commission, although when the program was instituted, it was agreed that if applications were received from certain countries, those applications would be considered *de novo*.

Mr. COLE. As far as you know, has that understanding been followed with respect to applications from those countries?

Mr. STRAUSS. As far as I know.

Mr. COLE. What was there about the Finland application that was the basis for concern?

Mr. STRAUSS. I would say that concern was not shared. My concern with the application from Finland was the size of the application, which was considerably larger than that amount applied for by any other country, including much larger countries, and the unhappy political position of Finland in the world.

Mr. COLE. Does the Military Liaison Committee play any part in clearing these applications for isotopes?

Mr. STRAUSS. I cannot answer that question because I do not know.

Mr. COLE. Do you know whether the Military Liaison Committee, even though it may not have expressly approved of the decision of the committee at the time it was made with respect to isotopes, has since indicated any opinion, either in support or in opposition to the decision?

Mr. STRAUSS. I do not know.

Mr. COLE. If the liaison committee had been opposed to the decision of the Commission, would not that fact have been brought to your attention?

Mr. STRAUSS. I should think so.

Mr. COLE. So the fact that you do not know would indicate that the Military Liaison Committee has not disapproved the decision?

Mr. STRAUSS. My answer to the effect that I do not know, Mr. Cole, was based upon my feeling that it was an impropriety for me to testify as to whether or not the Military Liaison Committee approved or disapproved any action of the Commission.

Mr. COLE. But can you not tell us from your own knowledge whether if the Military Liaison Committee had disapproved, you would have known it?

Mr. STRAUSS. Had there been a formal disapproval, I feel certain I would have known it.

Mr. COLE. That is all, Mr. Chairman.

The CHAIRMAN. Mr. Jackson?

Mr. JACKSON. Admiral Strauss, I take it that your fear in connection with the dissemination of isotopes is the possible use that it might be put to by other countries which might be detrimental to the United States.

Mr. STRAUSS. That is correct.

Mr. JACKSON. As I understand it, the Commission before acting on this matter had the advice of the General Advisory Committee.

Mr. STRAUSS. That is correct, sir. I read from a part of that advice a few moments ago, in which that board expressed its attitude with respect to military use, the diversion of the material to military research.

Mr. JACKSON. The General Advisory Committee was in agreement on the isotope policy?

Mr. STRAUSS. As hitherto carried on, I should say they were in agreement without qualification.

Mr. JACKSON. Without qualification. You feel that the men on the Advisory Committee are men of loyalty and integrity and believe in our institutions and our way of life?

Mr. STRAUSS. I most certainly do.

Mr. JACKSON. Included on the board that passed on this policy is Dr. James Conant, president of Harvard University; is that correct?

Mr. STRAUSS. That is correct.

Mr. JACKSON. No question about his real interest in the security of our country?

Mr. STRAUSS. None whatever.

Mr. JACKSON. Also included on the Advisory Committee is quite an eminent businessman and industrialist, Hartley Rowe, vice president and chief engineer of the United Fruit Co.?

Mr. STRAUSS. That is correct.

Mr. JACKSON. No question about his standing and loyalty to our country?

Mr. STRAUSS. None.

Mr. JACKSON. Also included on the board is Oliver E. Buckley, president of the Bell Telephone Co.; is that correct?

Mr. STRAUSS. That is true. Dr. Buckley was not a member of the board at the time that the recommendation in question was made. He is a recent appointee.

Mr. JACKSON. Do you know whether Mr. Buckley is opposed to this policy?

Mr. STRAUSS. I have never had an opportunity to discuss it with him or to hear his views expressed.

Mr. JACKSON. Would you not feel, without mentioning all the other members of the Advisory Committee, that the Commission acted prudently and wisely in getting the advice of such an eminent group of men?

Mr. STRAUSS. The statute requires that we do so.

Mr. JACKSON. Yes; but is not that quite a safeguard as far as protecting the security of our country is concerned?

Mr. STRAUSS. Yes, sir; but the final responsibility rests not with an advisory board but with the five Commissioners.

Mr. JACKSON. That is correct; under the statute, there is no question. But would you not say that the Commission received good advice and good counsel in having the assistance of such an eminent board?

Mr. STRAUSS. Having the assistance; yes. In taking the action that it took, Mr. Jackson, of course, my vote is the evidence of my opinion.

Mr. JACKSON. Yes, and these men that are on the committee, in addition to the ones I have mentioned, include a number of outstanding scientists and physicists, men who are familiar with the atomic energy program and all of its implications?

Mr. STRAUSS. If you omit "all of its implications," I would subscribe to that.

Mr. JACKSON. Dr. Robert Oppenheimer, director of the Institute for Advanced Study, of Princeton; Dr. Lee A. Du Bridge, president of California Institute of Technology; Dr. Enrico Fermi, professor of physics, Institute of Nuclear Physics, University of Chicago; Dr. I. I. Rabi, chairman, department of physics, Columbia University; Dr. Glenn T. Seaborg, professor of chemistry, University of California, at Berkeley; Dr. Cyril S. Smith, director of the Institute for Study of Metals, University of Chicago; and Dr. John H. Manley, the secretary and, I believe, connected with the Los Alamos project. The other men I mentioned previously, so I did not include them in the list.

Mr. STRAUSS. They are members of the General Advisory Committee.

Mr. JACKSON. Would you not say on this board you have businessmen with long experience and good judgment and, in addition, you have the scientific personnel, men who can technically pass on a problem such as the one that was presented to the Commission?

Mr. STRAUSS. Well, sir, I might add that the Commission has not felt it is under the necessity of accepting all the recommendations of the General Advisory Committee and has not done so.

Mr. JACKSON. In this case I am talking about.

Mr. STRAUSS. In this case the Commission did.

Mr. JACKSON. I am confining my questions to the isotope policy.

Mr. STRAUSS. That is right, sir.

Mr. JACKSON. Is there much difference, Admiral Strauss, in providing military assistance to one of the Atlantic Pact countries, Norway, and sending these isotopes over for metallic research?

Mr. STRAUSS. I think, sir, that would be a question for the determination of the President and the State Department and not of the Atomic Energy Commission; and that runs directly to the point of my vote.

Mr. JACKSON. But as a practical matter, would there be a great deal of difference in sending tanks and guns and other advanced type of equipment that is proposed under the Atlantic Pact and sending isotopes?

Mr. STRAUSS. No; but I understand that the other proposal has not received the approval of the Congress. This is an act which has taken place without reference to, or approval by, the Congress.

Mr. JACKSON. I appreciate that, but I believe that you understand our policy is, at least, thus far, it has been reported out of the committee, to preserve the territorial integrity of these countries—let's put it that way—that are participants or will be participants in the Atlantic Pact; and it is common knowledge that the program would be implemented with military assistance.

Mr. STRAUSS. Unfortunately, sir, I know too little about it to give you a responsive answer. I am not trying to dodge it. My feeling simply is that if that becomes the policy of our Government, its implementation then becomes the function of agencies created and designed for that specific purpose. That purpose does not appear in the McMahon Act under which the Commission operates.

Mr. JACKSON. In other words, as I get it, your difference with the other four members on the Commission is an interpretation of the provision in the act.

Mr. STRAUSS. That is a correct statement.

Mr. JACKSON. Do you feel, Admiral Strauss, considering the steps taken by the Commission in this instance, that the Commission was guilty of incredible mismanagement?

Mr. STRAUSS. No; I think this was an error in judgment. I do not think this had anything to do with management.

Mr. JACKSON. Do you think the conduct of the Commission during the period that you have served on it is such that it has been guilty of incredible mismanagement?

Mr. STRAUSS. Mr. Congressman, I think that is a difficult question to put—

Mr. JACKSON. You are a man of long business experience in operating various business enterprises and have had an opportunity to observe the management of business in large enterprises.

Mr. STRAUSS. I have never seen an enterprise like this, Mr. Congressman.

Mr. JACKSON. I appreciate there is not something quite analogous to it in size, but you are a man of substantial business experience. I realize your possible hesitancy.

Mr. STRAUSS. I wish you would permit my hesitancy to continue as a matter of record. It is somewhat reminiscent of the judgment of Paris. I could no more pass judgment on my colleagues than you on yours.

Mr. JACKSON. You have had the opportunity to witness the operation of the Commission during this period of time.

Mr. STRAUSS. I have.

Mr. JACKSON. You are familiar with the very difficult situation that confronted you and your colleagues when you took over from the Manhattan District.

Mr. STRAUSS. I am.

Mr. JACKSON. And in view of what you have observed as a member of the Commission in all of its ramifications, do you think the Commission is guilty of incredible mismanagement?

Mr. STRAUSS. I am too close to the picture to make a judgment. My feeling is we have done in many respects a remarkably fine job, that we have made a number of mistakes.

Mr. JACKSON. That would occur in any kind of—

Mr. STRAUSS. That I cannot say. The evaluation of our performance—and I share in this with the Commission—the evaluation of our performance must be made from the outside.

Mr. JACKSON. Must be made—I did not understand.

Mr. STRAUSS. From the outside. I am too close to the picture to give a judgment to which I could subscribe.

Mr. JACKSON. You think the Chairman of the Commission is an able man?

Mr. STRAUSS. I certainly do.

Mr. JACKSON. And he has done a good job?

Mr. STRAUSS. I do not think I personally could have done a better job.

Mr. JACKSON. That is all, Mr. Chairman.

Mr. PRICE. Do you know of anyone who could have done a better job?

Mr. STRAUSS. I have a long list of people, acquaintances, some of whom I think a great deal more of than I do myself. Some of them could do a better job than I could.

The CHAIRMAN. Mr. Elston?

Mr. ELSTON. Admiral Strauss, as I understand it, the Advisory Committee did not at any time pass on the question of the shipment of isotopes to foreign countries for military purposes.

Mr. STRAUSS. Mr. Elston, there was a clicking, and I did not hear your question.

Mr. ELSTON. As I understand your statement, the Advisory Committee did not at any time pass upon the question of the shipment of isotopes to foreign countries for military purposes?

Mr. STRAUSS. My understanding is that at this fourth meeting, they quite specifically opposed it.

Mr. ELSTON. Yes. Their only recommendations were with respect to the use of isotopes for humanitarian purposes.

Mr. STRAUSS. Well, their statement was "for research and medical therapy."

Mr. ELSTON. Yes.

Mr. STRAUSS. Those are the words.

Mr. ELSTON. Now, some inquiry was made about the size of the shipment to Finland. I do not know whether the exact size is something that should not be revealed, but I will ask you how the size compared with the isotopes that were sent to other countries for medical research.

Mr. STRAUSS. I know the figures, sir, but I have a feeling that there is some delicacy involved in putting them in the open record.

Mr. ELSTON. I would not press you for an answer, that is, in open session.

Mr. STRAUSS. Thank you, sir.

The CHAIRMAN. Does that conclude the questioning of Admiral Strauss?

Senator HICKENLOOPER. I had a question or two.

The CHAIRMAN. I beg your pardon, Senator.

Senator HICKENLOOPER. I wanted to ask this question—may I ask this question, Admiral: We have records and reports from the Commission here on the amount of the isotope shipments. With respect to the question that Mr. Elston asked you, would you care to give an answer along this line as a rough comparison: Would you consider that the request for the isotope allocation or shipment to Finland was considerably greater than its size as a country and the general scientific equipment that it had would indicate, in comparison with, say, countries like Great Britain or Belgium or France or some of these other countries?

Mr. STRAUSS. Senator, to be responsive to that question, I would have to say that I had no criteria as to its needs. My only idea of measurement was the amount of the same isotope requested by other countries of far greater size and population. It was out of proportion, very much out of proportion, by a factor of many times, and that, together with the location of Finland, was the basis for my dissent on that particular item.

Senator HICKENLOOPER. Was the matter of the shipment of the isotope of iron to Norway the subject of Commission action?

Mr. STRAUSS. No, sir; it was handled by staff.

Senator HICKENLOOPER. I do not have any further questions.

Senator MILLIKIN. Mr. Chairman, may I ask one question?

The CHAIRMAN. Yes, Senator.

Senator MILLIKIN. Admiral Strauss, just as a matter of principle, where important matters affecting our security are concerned, do you believe that we can make important plans or take important actions on the theory that the international friendships and enmities of the moment will have permanence?

Mr. STRAUSS. Obviously, Senator, my answer on that is completely unrelated to my service on this Commission.

Senator MILLIKIN. I understand that.

Mr. STRAUSS. My observation is that international friendships are ephemeral.

Senator MILLIKIN. I would suggest, before a lot of argument is made on that point, that the history of World War II be reviewed, the history of the Balkan wars be reviewed, and if anyone wants to have some real skull practice on the subject, he should study the Napoleonic wars.

Thank you very much.

Mr. STRAUSS. Thank you.

The CHAIRMAN. Thank you, Admiral Strauss.

Mr. STRAUSS. Thank you, Mr. Chairman. Thank you, gentlemen.

The CHAIRMAN. Now, Mr. Lilienthal. I think before you commence, I should say I have sent for the minutes of the joint committee, reporting the meeting we had with the Commission upon this subject, because I think it is only fair for the public to know that this matter was discussed with the Joint Committee on Atomic Energy at some length. Have you, in your files, any communication from the joint committee disapproving of the action that was taken?

**STATEMENT OF DAVID E. LILIENTHAL, CHAIRMAN, UNITED STATES ATOMIC ENERGY COMMISSION; ACCOMPANIED BY CARROLL L. WILSON, GENERAL MANAGER, AND JOSEPH VOLPE, JR., GENERAL COUNSEL, UNITED STATES ATOMIC ENERGY COMMISSION**

Mr. LILIENTHAL. No; no, we have not. We have communications on the subject, and I assume we can put our hands on them at the moment.

The CHAIRMAN. I am talking about general policy questions. As I recall—I have sent for the minutes of the meeting to refresh my recollection—the matter was brought up in the joint committee at a very extensive hearing.

Mr. LILIENTHAL. That is correct, Senator.

The CHAIRMAN. And I think it is only fair that that fact should be known. It should be put into the record that this is not the first time—that the joint committee considered under Senator Hickenlooper's chairmanship—the joint committee did discuss this question. Am I not correct?

Mr. LILIENTHAL. The chairman is correct in that statement.

Senator KNOWLAND. Mr. Chairman, might I ask Mr. Lilienthal one question?

The CHAIRMAN. Yes.

Senator KNOWLAND. May I ask whether to his knowledge the question of the shipment of the radioisotopes to Norway for military purposes was ever brought to the attention of the committee and was it ever discussed?

Mr. LILIENTHAL. Senator Knowland, as I will indicate shortly, there has been no shipment to Norway for military purposes. The Norwegians themselves say this is not for military purposes, and I am in the habit, because of my very high regard for Norway and the Norwegians and their record, of feeling that they are not dissembling; I think their statement may be taken as correct.

I must say that I am considerably disturbed about the aura of suspicion of Norway that this whole discussion has created here, not intentionally, I am sure, but necessarily, and I hope we will not delay in clearing that up.

Senator KNOWLAND. Well, Mr. Lilienthal, with all due respect to you, so far as I know, no one has cast any reflection on Norway, which is a very fine country and is one of the Atlantic Pact nations. I still would like to ask the question——

Mr. LILIENTHAL. I have answered it, Senator.

Senator KNOWLAND (continuing). If on the shipment to Norway, which we have particular reference to, if that matter was specifically called to the attention of the joint committee; and the committee, I believe, is entitled to a straight answer to that question. Was it?

Mr. LILIENTHAL. Yes, it was reported, Senator. The reason I did not answer the question is that you had in the question a statement which you would not have wanted me to include in it if I thought it was contrary to fact, that is, the matter of military use. The answer is: It was reported.

Senator KNOWLAND. It was reported to the committee just quite recently, was it not?

The reason I want to bring it up——

Mr. LILIENTHAL. The transaction is a recent one.

Senator KNOWLAND. That is right. The chairman of the committee has said that this matter of isotope shipments had been discussed with the committee before. That is quite correct. But I believe it was on the basis that it was for medical research and humanitarian purposes. I wanted the record to be perfectly clear that so far as I know, the specific matter of the shipment to Norway, under the request as given in the document presented to this committee, was not specifically discussed with this committee heretofore.

Mr. LILIENTHAL. Senator, the last part of your statement is correct, but may I, with all respect and without the slightest disrespect, point out that there was never any indication that the distribution of isotopes, whether within this country or abroad, was limited to medical applications or medical research? It is true that about 80 percent had been so used, but it has been made very plain that the scope of this distribution was research and medical therapy; and research is what the Norwegian distribution concerns itself with.

Mr. JACKSON. Mr. Chairman, I wonder if it would not be fair to have read into the record correspondence between the Commission, if there is any, and the committee regarding this isotope problem? I think that it all ought to be made public, except any part of the correspondence that might be restricted.

The CHAIRMAN. Mr. Jackson, I think that is a proper request. We will endeavor as quickly as possible to get the file from the joint committee files bearing upon this particular subject.

Mr. JACKSON. I would like for it to be read into the record, not just placed into the record.

The CHAIRMAN. I understand that, and I will endeavor—

Mr. PRICE. Mr. Chairman?

The CHAIRMAN. Just a minute, Mr. Price. I will endeavor to have that brought from the committee's offices. As you know, it is over in the Capitol and it may take 10 or 15 minutes to locate; but, Mr. Price, you have a question. Please proceed.

Mr. PRICE. Mr. Chairman, I would like to ask Mr. Lilienthal whether this shipment to Norway was reported to the committee in the usual manner.

Mr. LILIENTHAL. It was reported in the usual manner.

Mr. PRICE. What is the usual manner?

Mr. LILIENTHAL. The usual manner is, I believe, a monthly report. This leads me to raise a question. I am somewhat puzzled by my friend Lewis Strauss' suggestion that there is any delicacy about these figures on the shipment to Finland. This paper was put in the record yesterday in which we indicated it was a routine monthly report and contains a statement about shipments to Finland. I think it would be unfortunate to cast an aura of mystery about this subject, because these isotopes that are shipped abroad are not secret.

Mr. PRICE. They are not classified information?

Mr. LILIENTHAL. No. And the shipments in the monthly report will indicate, if you would total them up, that there were 300 millicuries of radio phosphorus and 6 shipments made to Finland. I do not see where there should be any aura of mystery.

(The following information was submitted later for the record :)

The above statement was an inadvertent error. A full statement of facts on requests from and shipments to Finland of radioisotopes is set forth in Mr. Lilienthal's letter to Senator McMahon of June 9, 1949. As stated in that letter, the shipments actually made consisted of 1 millicurie of the three radioisotopes: calcium 45, cobalt 60, and zinc 65.

The CHAIRMAN. Just a minute, gentlemen—we cannot have order with everybody talking at once. Are you finished with your question, Mr. Price?

Mr. PRICE. Yes.

The CHAIRMAN. Senator Knowland?

Senator KNOWLAND. I would just like to ask Mr. Lilienthal this: Does the shipment that had been proposed to be made to Finland, which was not made, show up in this report?

Mr. LILIENTHAL. A shipment which is not made, I suppose, would not show up; I am not sure.

Senator KNOWLAND. In other words, there was a request made from Finland for a greater amount, which, for a number of reasons which as yet have not been brought out at this time, the Commission did not finally ship. Does that show any place in the report submitted to the committee?

Mr. LILIENTHAL. The report to which I referred, Senator, was a report, a monthly report, of shipments; so, I assume it does not appear, but on the 18th of January, Senator—

Senator KNOWLAND. Of this year?

**Mr. LILIENTHAL.** Of this year. I am sorry, the 18th of January 1949, the Commission directed a communication to Senator Hickenlooper, a letter which I signed, informing the joint committee of the proposed inclusion of Finland in the program for distribution of radio-isotopes, and the letter, I assume, will be here fairly soon.

**Senator VANDENBERG.** Mr. Chairman, before Mr. Lilienthal proceeds, I want to make an observation upon the fact that he has twice said this morning that there is some implication in this Norwegian situation of a reflection upon Norway.

I find no implication of any such sort except in Mr. Lilienthal's own statement, and I think it would be most unfortunate if any remote implication were left, remotely in the record. Whether or not these isotopes are shipped to unfriendly or doubtful nations might add to the reason why they should not have been shipped, but the fact that a nation is a friendly nation does not change in the slightest the Commission's responsibility to the law, and so far as I am concerned, it is my understanding that the question here raised has no relationship whatever to any remote reflection upon Norway, but relates itself exclusively to the internal justification of the action of the Commission under the law.

Mr. Lilienthal is well familiar with the fact that there are some other arguments that we have had, which have never been a matter of public record, and probably never should be, regarding other Commission decisions in respect to highly friendly nations.

The friendliness of a nation and our complete trust in it, I hope, are not to be factors of consideration in this survey.

My distinguished friend, the Congressman from Washington, said something a little while ago about the fact that since Norway is a member of the contemplated North Atlantic Pact, underscores the fact that it has a special identification of friendliness. That is quite true, but there is absolutely nothing in the North Atlantic Pact which changes by one comma the responsibilities of the Atomic Energy Commission in respect to its administration of the law.

Now, I just hope we have heard the last of any implications about the friendliness or unfriendliness of those with whom we are dealing.

I do not want to leave any misunderstanding about what I am saying. The shipment of isotopes to an unfriendly nation is a dangerous enterprise under any circumstances.

But the fact that a nation is obviously friendly and reliable—as is the clear case with Norway—does not relieve the Commission of its duty to consult the implications of the law under which it operates in respect to security. It is no reflection on Norway to apply such tests.

**Mr. LILIENTHAL.** Senator McMahon?

The **CHAIRMAN.** Just one minute.

**Mr. JACKSON.** May I make this observation? I think the Senator from Michigan has gone to the heart of this whole inquiry. The difficulty is that the record, I think, is pretty clear, but when the final outcome appears in the papers, the wrong inferences are drawn by the public. I think that is the unfortunate aspect of some phases of the hearing.

For instance, on Monday, the Senator from Iowa stated, as I recall, nothing about the disloyalty of the individual referred to as case A,

but I called to the attention of the committee headlines from three important newspapers in which the opposite inference was carried, and they are reputable newspapers; and I again refer to it: In the New York Times, after the hearing had been conducted on case A, it said:

"Atom Aide Under FBI Cloud; Had Data on Hottest Secret."

Then, the Washington Star said:

"Loyalty Suspect"—this is a headline—"Declared Author of Atom Reports."

I think that is the viciousness of what results from a hearing of this kind when all of the facts are not brought out, and unfortunately certain parts are brought to light, and the balance remain up in the air.

The CHAIRMAN. Well, we cannot edit all the newspapers; we cannot write all the radio commentators' remarks on this. I guess under our system that would be considered to be not only unnecessary, but decidedly unwise.

Mr. JACKSON. I quite agree with the Senator. I am not suggesting, Mr. Chairman, censorship. All I am suggesting is that we have everything out.

The CHAIRMAN. You are outlining the problem.

Now, Mr. Lilienthal, with those few preliminary remarks, can we hear from you about what you have to say about radioisotope shipments abroad?

Mr. LILIENTHAL. At the risk of being taken out into the woodshed by Senator Vandenberg, my respect for him and his judgment hardly being one of the secrets for which I am responsible, I would just like to respectfully suggest that the friendliness or unfriendliness of a country is necessarily a relevant consideration.

For example, the suggestion about Finland is because there is a country about which we had to consult the State Department, and I make this point in order to get it out of this situation, because you will recall that great emphasis was put upon the fact that this was a military establishment. This raises the question: If this were a hospital, that is one thing. If it is a military establishment, why then what about the Norwegians and the military establishment?

Except for the chairman of the Foreign Relations Committee, there cannot be anyone who can speak with more authority on the subject to which Senator Vandenberg has addressed himself, but I am also disturbed in the fact that in the statement made this morning by my friend, Lewis Strauss, appears phrases such as this, "the assisting of scientists in unfriendly countries."

There was a discussion yesterday about the jet engines and rockets. Now, I would be very happy if those inferences could somehow be obliterated, so that we get down, not to the question of whether there is something ominous in sending isotopes for what the Norwegians say is not a military use, although it is a military establishment, and just pass over it to the other phases of the case. But it has been injected, and I think unfortunately injected.

There are, if I may proceed from there, a number of points at this juncture I should hope the committee would hear. One of the first is the question of the law.

There was a discussion of the law and what it means yesterday, and I think our General Counsel, Mr. Volpe, can clarify a good many of the loose ends.

We entirely omitted from our consideration yesterday some rather specific provisions of law about radioisotopes. That is natural in the less-than-calm atmosphere of a hearing, under lights, and so on, and I think that would help to kind of get back to the law.

The CHAIRMAN. Are the lights bothering you?

Mr. LILIENTHAL. No, there is nothing that bothers me now, Senator. [Laughter.] Not recently.

The second is a question of history. The history of this is very relevant. The history dates back, as I should like to indicate in some reasonable detail, to communications in January of 1947 when the Commission—I was about to say—had just gotten into the saddle, but I do not think, considering the amount of daylight between the Commission and the saddle at that time, that that would be a good figure of speech.

At that time Colonel Nichols, who was the deputy to General Groves, and who is now a major general, and head of the armed forces special weapons project, addressed a communication to the General Manager of the Commission dealing with the foreign distribution of isotopes produced in the atomic pile.

This was followed some weeks later by a memorandum even more explicit by Colonel Haywood, assistant to General Groves, at the Manhattan District, on the same subject, and is followed by the history on down—by the history, from that point forward.

Then, I should like to comment on some of the points made by Lewis Strauss, and with this general comment: We have all, I believe, had a good time on this job, partly because it is so onerous and heavy that you are drawn together with men whom you are necessarily and by circumstances associated. Among these men, no one of the five of us knew the others in any personal way, and I think the record of free and easy discussions, in a family sort of way, and disagreements around the table, have brought out the facts that men of divergent viewpoints can find a common basis for understanding.

Far from there being any criticism of anyone for lack of unanimity, I think if anything, the record of the Commission might be criticized in the fact that its Chairman and the members sought so hard on every point to try to establish unanimity. Unanimity is something that occurs occasionally—occurs in a criminal jury, but it is not the ordinary course of human events, and I want to say that the relations between the Commissioners have continued to be relaxed and friendly, whether there is unanimity or not.

As to the basis of the law, may I request that Mr. Volpe review that in the light of the fairly scattered discussion of yesterday?

The CHAIRMAN. Proceed, Mr. Volpe.

Mr. VOLPE. The section of the act which deals expressly and specifically with distribution of isotopes is section 5 (c). The title is "By-product Materials. Definition."

As used in this act the term "byproduct material" means any radioactive material (except fissionable material) yielded in or made radioactive by exposure to the radiation incident to the processes of producing or utilizing fissionable material.

#### Subsection 2, "Distribution":

The Commission is authorized to distribute with or without charge byproduct materials to applicants seeking such materials for research or development activity, medical therapy, industrial uses, or such other useful applications as may be developed. In distributing such materials the Commission shall give preference

to applicants proposing to use such materials in the conduct of research and development activity or medical therapy. The Commission shall not distribute any byproduct material to any applicant, and shall recall any distributed materials from any applicant who is not equipped to observe or who fails to observe such safety standards to protect health, as may be established by the Commission, or who uses such materials in violation of law or regulation of the Commission, or in a manner other than as is disclosed in the application therefor.

I would call attention to the fact that there is no other limitation in section 5 (c) of the Atomic Energy Act with respect to distribution.

The very next section, it seems to me, is quite relevant and pertinent to this question of foreign distribution. The next section then reads:

General provisions. The Commission shall not, (1) distribute any fissionable material to (a) any person for use which is not under or within the jurisdiction of the United States; (b) any foreign government; or (c) any person within the United States, if in the opinion of the Commission the distribution of such fissionable material to such person would be inimical to the common defense and security.

Therefore, we find in section 5 specific and express authorization for the distribution of radioisotopes, and in the very same section a flat prohibition with respect to the export of fissionable material.

Now, at the time the McMahon bill was reported out of the McMahon special committee, the chairman of the special committee, Senator McMahon, made some observations with respect to this provision. Senator McMahon, in his commentary on section 5 in the McMahon section of the committee report, stated that, and I quote:

Testimony before the committee indicates that the radioactive material—

The CHAIRMAN. Just a minute. This was a committee report, this was not my report.

Mr. VOLPE. I believe this was your commentary, sir, on the Senate floor.

The CHAIRMAN. When the bill passed through the Senate?

Mr. VOLPE. That is right, sir.

I will begin again:

Testimony before the committee indicates that the radioactive materials yielded in the production of fissionable materials are of enormous scientific and industrial value, and their distribution involves no danger to the national security. The Commission is required to distribute these materials with or without charge for research and development activities, medical therapy, and industrial and other uses, giving priority to medical uses and research.

I would also call attention to the fact, a fact which is, of course, well known, that before the McMahon bill was reported out of the special committee, there had been weeks and weeks of testimony by a very large number of competent and distinguished scientists.

There had been a considerable amount of testimony before the McMahon committee on this very question of the distribution of isotopes, and I believe that the record will bear out Senator McMahon's statement at the time the bill was being considered on the Senate floor that the distribution of radioisotopes in no way would affect the national security of the United States.

Yesterday we discussed section 10 (a) (1) of the McMahon Act. I would like to refer, in addition to 10 (a) (1), to section 10 (a) (2). Section 10 (a) reads, and I quote:

It shall be the policy of the Commission to control the dissemination of restricted data in such a manner as to assure the common defense and security.

Consistent with such policy the Commission shall be guided by the following principles.

Then section 10 (a) (2) reads:

That the dissemination of scientific and technical information relating to atomic energy should be permitted and encouraged so as to provide that free interchange of ideas and criticisms, which is essential to scientific progress—

Yesterday we discussed 10 (a) (1), which reads:

That until the Congress declares by joint resolution that the effective and enforceable international safeguards against the use of atomic energy for destructive purposes have been established there shall be no exchange of information with other nations with respect to the use of atomic energy for industrial purposes.

Now, it would seem to a casual reader of these two provisions that there is a contradiction in the law. Actually we have felt that there is no contradiction in the law, and that the Congress wisely found and wisely declared that a real distinction could be made by scientific and technical people between those things which have to do with industrial or military uses of atomic energy, and those things and those matters which have to do with scientific progress and scientific research; and it is in this way that the Commission has attempted to administer this law, and it is in this way that the Commission arrived at its conclusion that the distribution of radioisotopes did not have to do with the utilization of atomic energy for industrial purposes, but rather had to do with the utilization of radioisotopes for scientific research and progress.

The early record of the Commission's consideration of foreign distribution to which Mr. Lilienthal referred goes back to January 15, 1947, and perhaps, Mr. Lilienthal, you would like to take over.

Mr. LILIENTHAL. First is a memorandum of January 15, 1947, 2 weeks after the Commission, by Executive order, became responsible for what was then known as the Manhattan District, and this is a memorandum from Col. K. D. Nichols to Mr. Carroll L. Wilson, who is, of course, the General Manager of the Commission. Colonel Nichols I have previously described.

One says:

The Clinton Laboratory at Oak Ridge is currently producing and selling certain unclassified radioisotopes to institutions within the United States for scientific and research purposes.

Senator HICKENLOOPER. Mr. Chairman, may I just ask a preliminary question?

The CHAIRMAN. Yes.

Senator HICKENLOOPER. What is the marking on that document? What is the classification?

Mr. LILIENTHAL. This is marked "confidential."

Senator HICKENLOOPER. That is all, Mr. Chairman. I am not raising any question. I was merely curious because there were a number of other confidential documents which, I believe, in my own personal opinion, have no reason to be marked that way, but I have refrained from using confidentially marked documents up to this time without the full approval of the committee. I merely make that point.

Mr. LILIENTHAL (reading):

1. The Clinton Laboratory at Oak Ridge is currently producing and selling certain unclassified radioisotopes to institutions within the United States for scien-

tific and research purposes. No such sales have been approved for foreign countries in general, but Canada and Great Britain have been advised that they could purchase isotopes on sale in this country and surplus to United States requirements.

2. Pursuant to this policy, Dr. W. B. Lewis, National Research Council—the National Research Council being a Canadian institution—

Chalk River, Canada, was notified by letter of 20 November 1946 that his laboratory had been allocated the following materials: 12 mc. separated P32, 5 mc. C14 in barium carbonate, 1 irradiation unit of S35, containing approximately six mc. of S35 in 33g of KCl, irradiated beryllium nitride, containing approximately 0.2 mc. of C14.

Five mc. each of Sr 90 and Ru 106 were also tentatively allocated pending receipt of further specifications. No shipments of isotopes have actually been made to Canada, as purchase orders from Chalk River were not received in time to permit shipment before 1 January 1947.

3. Mr. W. H. Stephens, Assistant Director, United Kingdom Scientific Mission, has requested the following materials for the Atomic Energy Research Establishment, Harwell, England: 2mc. of C14, 2mc. of S35, 20 mc. of I131, 50 mc. of P32, 10 mc. of Zn65, 5 mc. of Ca45.

Mr. Stephens has not been advised of any allocation of material. Under the Manhattan District policy, all of the items requested could be allocated except the iodine 131 and phosphorus 32, the current supply of these materials not meeting the United States demand.

4. In view of the past collaboration in atomic energy matters among Canada, Great Britain, and the United States, it is recommended that the AEC approve continuance of the policy of making available for sale to Canada and Great Britain isotopes currently on sale for unclassified off-project use in this country and surplus to United States requirements.

The next memorandum in this important history of the background of the Commission's action in August of 1947 is a memorandum herein marked "restricted," from Col. K. D. Nichols to Mr. Carroll L. Wilson, which is entitled "Sale of Isotopes to Foreign Nations," dated January 21, 1947. It is as follows:

Some 20 foreign nations have indicated interest in purchasing unclassified radioisotopes currently being sold by Clinton Laboratories—

this is now called the Oak Ridge National Laboratory at Oak Ridge—

to institutions within the United States for scientific and research purposes. No such foreign sales have been approved and no definite commitments for such sales have been made except in the cases of Canada and the United Kingdom. (The special situation with respect to these two countries has been presented to the Commission for decision in memorandum of January 15, 1947—

this being the memorandum which I have just read into the record—

subject: Sale of Radioisotopes.) However, announcements on the isotope program have indicated that sales to foreign nations would be initiated after domestic requirements had been met and necessary distribution procedures developed.

That announcement to which Colonel Nichols referred is an announcement by the Manhattan District.

2. Isotope production facilities are now adequate to permit extension of sales of certain radioisotopes to foreign nations without affecting United States work. All isotopes now on sale in this country could be made available except radioiodine and radiophosphorus which can probably be made available at a later date.

3. If the Atomic Energy Commission decides to sell radioisotopes to foreign countries no responsibility for the safety of the proposed uses should be assumed. Foreign requests should be submitted through the appropriate national scientific body of the country concerned—the body corresponding to the United States National Academy of Science or National Academy of Medicine. Sale could be made to a designated agent within this country. This agent would be responsible for payment and necessary shipping arrangements.

The safety refers to the physical safety, that is to say, safety of those handling or exposed to the materials.

4. In order to provide information on activities of foreign nations in the field of atomic energy, requestors should be required to describe the proposed use of the requested isotope. Sale should appropriately be limited to publishable scientific investigations or clinical investigations or treatments.

5. The sales prices recommended for adoption by the Commission in my memorandum of January 20, 1946, subject: Revision of Prices for Off-Project Sale of Radioisotopes, would result in substantial subsidization—

I am having trouble with my z's this morning—

of the program by the Government. A higher price might be charged for foreign sales. Such increased prices would have to be established arbitrarily as the extent of actual subsidization will depend upon the volume of future sales. The Commission could appropriately establish the same prices in the interest of international good will.

6. The Atomic Energy Commission might logically approve sale to foreign nations or nations of isotopes currently or hereafter released for sale for off-project purposes in this country, provided these isotopes are surplus to United States requirements and are to be used for publishable scientific investigations or clinical investigations or treatment. However, prior to such approval it is recommended that the entire policy in regard to distribution be reviewed, either by the Commission employees or by an advisory group.

This is followed on January 30, 1947, by a memorandum from Col. O. G. Haywood, whom I previously described as having been an adviser and assistant to General Groves in this matter at the Manhattan District, to Mr. Bennett Boskey of the staff with reference to Sale of Isotopes to Foreign Nations. This is as follows:

1. The following information is furnished pursuant to your request for additional data regarding the radioisotopes program for use in connection with your study of Col. Nichols' memorandum of January 21, 1947, to Mr. Wilson on this subject.

Senator HICKENLOOPER. Would you give the classification of this document?

Mr. LILIENTHAL. This is unclassified; has never been classified.

2. A complete list of the isotopes currently on sale for off-project utilization is given in the Monsanto price lists—

and Monsanto then being the operator of the Clinton Laboratory—

as approved June 28, 1946. This price list was furnished Mr. Wilson as an enclosure of Col. Nichols' memorandum dated January 20, 1947, subject: Revision of Prices for Off-Project Sale of Radioisotopes. Briefly, the isotopes consist of specially irradiated samples and fission products. The irradiated samples are materials which are prepared and placed in a pile to be exposed to neutron irradiation. The fission products are materials resulting from the fission of uranium atoms in production or experimental piles.

3. All isotopes currently being sold under this program are radioactive and are produced in piles utilizing fissionable material. None of these isotopes being sold are fissionable. All of the isotopes, therefore, are "byproduct material" as defined in section 5, (c) (1) of Public Law 585.

That is the provision of the statute read by Mr. Volpe.

4. Radiosotopes may be used in practically every field of science. About 40 percent of the requests approved to date are for investigations directly related to medicine. A further 20 percent are indirectly related to medicine; for example, studies in physiology and biochemistry. However, materials have been allocated for use in a wide range of other fields such as agriculture, bacteriology, botany, chemistry, entomology, metallurgy, petroleum engineering, physics, soil science, and zoology.

5. Certain uses of radioisotopes may be directly or indirectly applicable to industry. For example, C-14 may be synthesized into a hydrocarbon molecule.

This labeled molecule may be used for laboratory experiments in tracing such hydrocarbon molecules through any chemical reaction such as in the manufacture of synthetic gasoline. This research may indirectly result in improved industrial processes. The labeled hydrocarbon molecules could equally well be used to trace the flow of underground oil—a direct industrial application.

6. The radiation emitted by radioisotopes as they decay usually results in nuclear transformations.

This is Col. O. G. Haywood, an officer in the United States Army who is talking.

7. None of these materials would directly assist any nation in producing a military weapon or in utilizing atomic energy for industrial-power purposes. Certain indirect assistance might be given by assisting them in developing and teaching laboratory and safety techniques, and in advancing basic scientific knowledge. For example, the release of fission products to foreign nations would permit their study of the effects of fission products upon human beings. This information, however, is declassifiable under the current Guides and is rapidly being released in this country. It is not considered that the furnishing of foreign nations with the isotopes currently on sale would furnish any information which could not be declassified under the current Declassification Guides.

8. In considering the wisdom of releasing radioisotopes to foreign nations, some consideration might appropriately be given to the fact that many of the ores in which the Project is interested are located in foreign countries. A list of these ore-deposit locations could be prepared if you consider this pertinent.

9. A list of the requests received from foreign nations—

this is as of January 30, 1947—

and the nature of these requests is attached for your information.

I would like to read, further in the background of this matter, testimony before the Special Committee on Atomic Energy in the hearing on bill S. 1717, which became the present Atomic Energy Act of 1946. This is part 2, pages 275–276, and the witness is Prof. Edward Teller, now of the Institute of Nuclear Studies of the University of Chicago, a very distinguished physicist and one of the consultants—a man who was engaged at Los Alamos during the war in the atomic bomb work and presently a consultant to the Commission.

His testimony is:

Use of radio elements which are byproducts of atomic power plants will have an extremely great influence in science, particularly in medical science. Work with these byproducts will lead to a better understanding of living organisms, and the knowledge so gained will, in the end, help to save human lives. Progress in this direction has been practically negligible so far. In the past this was due to necessary wartime secrecy which made it impossible to distribute the radio elements among the men who could have made use of them. The publication of the Smyth report has changed this situation. The distribution of many radio elements would disclose now no important secret and would result in no real danger since, in appropriately small quantities, these byproducts are harmless. That the byproducts have not been distributed and used in the last months is due, to a considerable extent, to the inertia of the administrative apparatus required for the distribution. I believe that these materials should be made available not only to scientists in this country but to scientists throughout the world. This would be a gesture which would cost us little and would bring us great returns in good will as well as in the advancement of scientific knowledge.

Senator MILLIKIN. May I ask, Mr. Lilienthal, for the citation?

Mr. LILIENTHAL. Yes. This is the hearing on S. 1717, part 2, that being the Atomic Energy Act, part 2, pages 275 and 276.

Senator MILLIKIN. Thank you.

Mr. LILIENTHAL. I should like to read into the record, because the question of relations to other countries and the question of the security,

the common defense and security involved in the distribution of isotopes abroad, have been properly raised, a memorandum to the Department of State which was proposed for the Commission's transmission to the Department of State by the General Advisory Committee of the nine distinguished gentlemen whose names—with whose names you are familiar.

This memorandum was used, was studied, by the Commission in making its representations to, and its communications to the Department of State.

The purpose of this memorandum is to inform—

Senator HICKENLOOPER. Would you state whether these documents are classified or unclassified?

Mr. LILIENTHAL. This document is unclassified.

The purpose of this memorandum is to inform the Department of State of certain considerations—

Senator HICKENLOOPER. I thought I saw a mark on the bottom of it, and I just wondered.

Mr. LILIENTHAL. The mark on the bottom says "Isotope Program," with a mark on it, and perhaps I should make plain that, if I did not in my preliminary statement, this memorandum was prepared by the General Advisory Committee for our use in addressing a communication to the Department of State.

A communication we, ourselves, sent to the Department of State will also be in the record, but these are among the considerations the Commission had before it in the decision which it reached.

The purpose of this memorandum is to inform the Department of State of certain considerations relating to the program of the United States Atomic Energy Commission to authorize distribution of specified radioisotopes to qualified users outside the United States.

The radioisotopes in question are byproduct materials produced in a uranium chain-reacting pile. They are valuable tools of research, of potential benefit to people everywhere, especially in the field of cancer control and in the study of biological and chemical processes. Radioisotope distribution within the United States was authorized by Manhattan District nearly a year ago. The experience gained from domestic distribution has satisfied the Commission that certain radioisotopes may now be distributed to meet the needs of doctors and scientists abroad. It is proposed that foreign distribution under this program will be in limited quantities and initially will be made only for uses certified to be for scientific research and for medical therapy, including such uses on animals as may be related to medical research and therapy. Such foreign distribution will not interfere with the Commission's continuing program for meeting the needs of qualified doctors and institutions in the United States.

The program of foreign distribution which the Commission proposes to authorize will enable doctors and scientists abroad to carry on new types of research and medical therapy of benefit to mankind. The results of such work will benefit the United States, as well as the rest of the world.

The foreign distribution will be on a limited scale. The Commission considers that this program for distribution will be advantageous to the United States and can be undertaken without any adverse effect on our common defense and security.

I would like to recall that there was some reference in the discussions within the Commission to the possible usage of these materials in respect to biological warfare.

It should be understood clearly—

returning to the reading—

that under the program proposed the Commission will not authorize any foreign distribution of radioisotopes which would further the development of atomic

energy for military or industrial purposes by any foreign government or any person abroad.

Foreign distribution will not be authorized for naturally radioactive materials, that is, the natural elements of higher atomic number than element 83 (bismuth).

Foreign distribution will not be authorized for any newly produced heavier element of higher atomic number than element 92 (uranium).

It is important to bear in mind that not all isotopes are provided for foreign distribution, and this limitation described here is the limitation, I believe, that was adopted in the Commission decision.

The CHAIRMAN. What is the basis for the distinction?

Mr. LILIENTHAL. The basis is a technical one that in the elements not on the distribution list, I understand, there would be a question of national security involved; whereas, in the other elements this would not be the case.

The report continues:

None of the radioisotopes to be distributed abroad are fissionable. The Commission proposes to authorize foreign distribution of limited quantities of the following radioisotopes:

Antimony 122, 124, 125	Cobalt 60	Potassium 42
Argon 37	Copper 64	Silver 108, 110, 111
Arsenic 76, 77	Gold 198, 199	Sodium 24
Bromine 82	Iodine 131	Sulfur 35
Calcium 45	Iron 55, 59	Zinc 65, 69
Carbon 14	Mercury 197, 203, 205	
Chlorine 36	Phosphorus 32	

The radioisotopes listed above are radioactive forms of ordinary elements which are found in nature in stable form. The Department of State will be notified in advance of any proposed deletions from or additions to the list.

I would suggest—

Let me read one more page and then perhaps go to something else.

All the radioisotopes proposed for foreign distribution were discovered prior to the war. They are all produced on Commission projects with a chain-reacting pile, but they also are all producible by other devices such as the cyclotron or other high-energy accelerators. A pile has the advantage of making production possible in much higher quantities at much lower cost. Most of the radioisotopes listed either have been produced abroad in small quantities or at one time were supplied by cyclotron laboratories in the United States. At present there are not sufficient operating cyclotrons abroad to satisfy legitimate demands for radioisotopes needed for medical uses. Cyclotron laboratories in the United States generally find it uneconomical, as well as detrimental to their research program, to attempt to provide these radioisotopes. The Commission's projects now constitute the only practicable source of supply for most of these radioisotopes.

Failure of the Commission to make foreign distribution would place the United States in the position of attempting to monopolize various types of medical research and therapy. Patients outside of the United States would be denied, at least for that period, the benefits of radioisotope treatment of proven therapeutic value.

Many fruitful lines of research for the discovery of new treatments and cures of disease, as a result of the progress of medical science, would be retarded, to the long-range injury of this country as well as others. There is no short-range benefit justifying such consequences.

The proposed program of distribution is wholly consistent with our paramount objective of assuring the common defense and security of the United States. This program will not in any way enable persons abroad to obtain significant information on classified production processes in use in the United States.

In this connection (1) the proposed program will exclude from foreign distribution those radioisotopes which are "fission products," that is, which result from fission. (The single exception, iodine 131, is discussed later.) In consequence, users abroad will have no opportunity whatever to divert radioisotopes, even in minute quantities, for use in studying means of separating fission products in any test plutonium production process they might attempt.

(2) Iodine 131, which has proved its importance in the treatment of thyroid conditions, will be distributed abroad under this program. This radioisotope is producible both by uranium fission and by the transmutation of tellurium. In the plutonium separation process, the iodine 131 is evolved as a gas and its separation presents no technical problem. The possession of iodine 131 will not assist any foreign government or any person abroad in studying the technical problems of separation inherent in any plutonium production process.

The small quantities of radioisotopes which would be distributed abroad under this program create no hazard of possible use in some form of poison warfare.

The radioisotopes now proposed for foreign distribution are all isotopes of elements used significantly in the human body or in studies of therapeutic agents. While the radioisotopes listed would be useful in fields other than medical research and therapy, the possibilities of diversion from the use certified in the application are remote and in any event would create no significant hazard:

(1) Only very limited quantities would be sent abroad; (2) they would be sent to a large number of different users; (3) much of the material remains radioactive for only a short time, and is expended in the process of the research; (4) reports of the work done will in large part disclose the uses to which they actually have been put—

Senator VANDENBERG. Mr. Lilienthal, may I just interrupt you with one question for my information at that point? To what extent do papers of this character come to the attention of the Military Liaison Committee for their evaluation of the security factor?

Mr. LILIENTHAL. When the Military Liaison Committee is advised of intended action by the Commission, and usually under the practice, a considerable period before that time, they have the full files of staff papers, discussions in staff, and then, documents of this character, so that there is on subjects in which there is any possibility of interest on their part, and this would be one of them, a complete staff liaison.

Senator VANDENBERG. For instance, in the case of the Norwegian shipment, would that come to the attention of the Military Liaison Committee?

Mr. LILIENTHAL. Well, I would not know, because this was dealt with not as a Commission matter, but as the exercise of a delegated authority in the staff, but since the staff liaison is now complete that my guess would be that they would have that knowledge. I think it would be helpful at some stage to describe the degree of interweaving of the two organizations at the staff level prior to the Commission decision.

Senator VANDENBERG. Well, I do not want to divert you from your line of approach, but I hope, before you are through, that you will give us an evaluation of whether or not you think the existing Military Liaison Committee either has an adequate approach to the security factor in your decisions, or whether or not they have adequately used the approach that they do possess.

Mr. LILIENTHAL. Well, let me state at once that I think that one of the most remarkable unifications of staff that I know of in any enterprise, even as complicated as this, where the interweaving of the two organizations in order that their views on all kinds of matters may be known at the earliest possible stage at the beginning, was far from adequate, as one might expect, but the development of that process, and by beginning early in the stage of consideration has been, in my opinion, one of the most interesting developments, managerially, in this enterprise, and my conclusion is, my own conclusion is, that it is very satisfactory. That appears to be the view of the Military Liaison Committee.

Senator VANDENBERG. So, the conclusion I would draw from your observation is that the Norwegian decision, for instance, was known to the Military Liaison Committee, and no complaint against it was registered?

Mr. LILIENTHAL. I cannot say that, Senator. I would have to check on that particular item, because it was a matter that was treated by staff and not by the Commission. I would have to check that.

Senator VANDENBERG. If it was not, would there not be a lapse at that point? Is that not the type of problem that the law contemplates, the use of at least the military liaison; there is that vice in at least the security factor?

Mr. LILIENTHAL. The law contemplates, as I think you said in the first session 2 years ago, that the Military Liaison Committee's ability to learn what is under consideration and to supply its counsel at every stage would apply to all matters of this character.

It certainly would in the case of the general proposition of the export of radioisotopes. I am sure that there was full knowledge; and, as you see, the Manhattan District itself had a policy on this matter. At that time, at the time of that decision, I believe the former commanding general of the Manhattan District was a member of the Military Liaison Committee.

Senator VANDENBERG. Excuse me, but I did not want to divert you; however, it seemed to me pertinent.

The CHAIRMAN. Is that General Groves who was on the Military Liaison Committee when this first shipment took place?

Mr. LILIENTHAL. I do not remember the time of his tenure. He was a member of the original Military Liaison Committee.

The CHAIRMAN. Yes; I know he was. Do you know when he got out?

Mr. LILIENTHAL. I should remember that, but I do not. My recollection is that he was a member at that time, but I will check that.

(The following information was submitted later for the record:)

General Groves left the Military Liaison Committee on February 29, 1948. The shipment of radioisotopes to Norway, discussed at the June 9, 1949, hearing, took place April 28, 1949.

Senator VANDENBERG. Who are the present members of the Military Liaison Committee, Mr. Lilienthal?

Mr. LILIENTHAL. They are, from the Navy, Admiral Hill, who was a recent replacement of Admiral Parsons; Admiral Hill was replacing Admiral Parsons, who was an original member—and Admiral Ofstie, a naval aviator. Those are the Navy men.

Members from the Army are Major General—from the Department of the Army—Major General Nichols and Colonel Hinds, who was also a member of the original group.

The members from the Air Force are Major General Schlatter, an Air Force officer, Slats Schlatter, and Brigadier General Wilson. The chairman of the committee is William Webster, formerly vice president and general manager of the New England Utility Co., and he is a Special Assistant to the Secretary of Defense.

Senator VANDENBERG. And is it your opinion that they are constantly in adequate contact with the decisions that are being made?

Mr. LILIENTHAL. I would have to leave it to them to say whether it is adequate. They have expressed dissatisfaction at times with ways in which it could be improved. We have analyzed these, and we have

all stated that the best way to improve this liaison is through early staff consideration, while things are being considered, long before they are jelled, and it is my understanding now, and certainly this has been the result of conversations and communications directed to us, that this relationship is more than adequate. That is a rather good illustration of how these two partners in this undertaking should deal with each other.

Senator VANDENBERG. How, for instance, would the question of the shipment of isotopes to Norway come to the attention of this committee, the Military Liaison Committee?

Mr. LILIENTHAL. The reason I am unable to answer the question is that the shipment itself was dealt with by delegation from the General Manager to the individuals in the Division of Research. Whether the Division of Research discusses these applications when they are received or transmits a copy of the application when such application is received, or how that is handled, is a matter of machinery to which someone else will have to testify.

On questions of major policy, as distinguished from the implementation of policy, these are handled chiefly through the head of the Division of Military Application, General McCormack, and his deputies through the Military Liaison Committee, and then, as these matters get farther along, they may well be the subject of a discussion between the two bodies.

For example, we have had under discussion—I mention this as an example, because these are the kinds of things of which the Commission is aware from day to day—we have had a question of the reorganization of the Sandia Laboratory. In the consideration of such a problem as this, this being the engineering end of atomic weapons, the discussions with the Military and the Military Liaison Committee usually precede the discussion with the Commission themselves in order that we come up with as nearly as possible a consensus from the very start, and ranging from that to questions of medicine and biology where the interest of the military may be relatively remote or in civil defense. There is a varying degree of this discussion.

Now, there are different procedures, Senator, in respect to different kinds of subject matters, as to how they are informed; where the subject is obviously one in which they have so large an interest as the Sandia Laboratory, it begins way back before the child idea is born, and goes all the way through.

Senator VANDENBERG. For instance, in a major difference on the question of national security, which arises to the dignity of a split vote in the Commission, would the Commission have the benefit of the opinion of the Military Liaison Committee before it?

Mr. LILIENTHAL. Yes, in a major question, it certainly would.

For example, the question of the custody of atomic weapons: That was a matter discussed over a period of months with the Military Establishment, both at the staff level and between the two bodies themselves.

Senator VANDENBERG. On this vote in which Commissioner Strauss was in the negative, did the Commission know the attitude of the Military Liaison Committee; and, if so, what was it?

Mr. LILIENTHAL. Well, the attitude was clearly not in opposition to the distribution of this, I would certainly know, because, if it were, then it would certainly have come very forceably to our attention,

and so my surmise is, although I would like to check, that there were no objections to it, and that they did have this whole subject in mind.

I also know that the Secretary of Defense was aware of the matter because the Secretary of Defense, Mr. Forrestal, told me that, after the Commission's action, Commissioner Strauss had discussed the matter with him and had presented his views in opposition to it, so I am sure there was full information about what the Commission had done.

I should add, as a postscript to your question about how satisfactory or adequate this relationship has been: It is, I think, partially responsive, at least, to say that the statute providing for the Military Liaison Committee, this section of which I believe you were the architect and the draftsman, provides for an appeal before the military services to the Secretaries, and from them to the President.

There have thus far under that provision been no such appeals. This would be a kind of proof of the pudding, I would think, and certainly, in a general way, although it does not answer the specific question about Norway—I am not seeking to follow that through.

Senator VANDENBERG. I am familiar with the record in respect to appeals, and I think it has its significance because if the Military Liaison Committee were seriously offended by your decisions, I assume they would act under the system provided for such action.

What I was asking was whether the system did work or whether it was clearly perfunctory.

Mr. LILIENTHAL. It is not perfunctory, and has not been from the beginning. Let me give one situation in which there was—one other—when there was disagreement; within my clear recollection, as contrasted to radioisotopes—that was not in the radioisotopes—this was in the declassification of a particular item. I am not mentioning the item, but it was a matter of the declassification of a single piece of information.

Here there were literally months of discussions between the staffs and, as I recall, some three discussions between the two bodies on the wisdom or lack of wisdom from the security point of view, military point of view, of the declassification of this item, and in the end the strong views against its declassification held initially by our colleagues of the Military Liaison Committee changed in the direction—changed, and they concurred in the idea that this, on the whole, was a proper decision.

I mention this because this is not where there are really difficult issues involved. Our respect for their judgment has been such that we have taken a great deal of time on some of these items.

Let me mention another which was even more illuminating as to how perfunctory or nonperfunctory our relation was. This related to an operating matter.

The conditions under which—not the security conditions, but the technical conditions—a certain facility of the Commission engaged in the production of fissionable materials should be operated, was the question. We had the conclusions of the General Advisory Committee and of our contractor, industrial contractor, as well as our own staff in charge of production, that a change in operations should be made, a different level of operations.

This matter was discussed by the Military Liaison Committee members, they being advised that the matter was under advisement. They made trips to the facility. They discussed the matter with engineers and others.

I believe they had a meeting with the General Advisory Committee, explored this matter for a considerable period of time, and finally an agreement was reached that the operating change was not contrary to the interest of the country.

I mention this because the difficulties of carrying on industrial operation under this kind of arrangement are very great, obviously. We are responsible for operations, and we have been criticized by the General Advisory Committee for not having put this change into effect sooner, and in a fairly recent expression on this point, and yet we have been so infiltrated, Senator, with the realization that this law means exactly what it says; that, despite the great pressure of operating decisions, we have taken plenty of time and a considerable risk to ourselves in the sense of the result of our decisions to make sure that the Military Liaison Committee, and thereby the Military Establishment, should have a full and complete opportunity to explore these matters.

There have been times when this has really been quite burdensome, but it is part of the law, and it has great meaning. I do not say that in every instance the procedure set up by the Commission, by which it delegates the administration of its functions—these being very complex and numerous—has always provided months of time for such consideration.

I mention these as illustrations, two illustrations, of the care with which and the nonperfunctory manner in which they have carried out that provision of the act.

Senator VANDENBERG. I just suggest, as a matter of prudence, that when you confront a crisis such as a split vote in your Commission, which is a crisis because it occurs so seldom, that it might be well for the minutes of your meetings to affirmatively indicate the attitude of the Military Liaison Committee on questions of national security.

Mr. LILIENTHAL. I would like to supplement the record, perhaps at this point, because this record will be difficult to read otherwise, as to what the records show. I have a clear recollection, and this is Mr. Volpe's recollection, as he has just indicated to me, that the matter was discussed in this very useful and informal staff relationship, that is, the relationship between our staff and the members of the Military Liaison Committee, and there was no objection. But let me make sure that was the case.

Senator VANDENBERG. I apologize for my interruption.

The CHAIRMAN. I think that is a very useful contribution, Senator.

Before you go on, Mr. Lilienthal, I think the record should show at this point that the Military Liaison Committee has been periodically before the joint committee without the presence of the Commission, and I do not believe that any security is involved in stating that the direct and point-blank question was asked and addressed to the Military Liaison Committee as to their satisfaction or dissatisfaction with the liaison between themselves and the Commission, and without any dissension and with no dissenting vote, the members of the committee who were present expressed their full satisfaction in the way the liaison arrangement had been and was working out.

Mr. LILIENTHAL. Thank you, Senator.

I hope, Senator Vandenberg, I have made it clear—I intended to—that the reference to the views of the Military Liaison Committee as to the export of radioisotopes decision as of August 1947 was the one we were talking about and not the Norway matter.

Senator VANDENBERG. I thought I was talking about the Norway matter. Was that cleared in any way with the military?

Mr. LILIENTHAL. This did not come to the Commission.

Senator VANDENBERG. It was at the staff level; was that it?

Mr. LILIENTHAL. Yes. The Norwegian shipment was pursuant to a policy and procedure set up by the Commission for handling these very numerous applications.

Senator VANDENBERG. So, does that mean the Military Liaison Committee was not informed regarding the Commission action before it was made?

Mr. LILIENTHAL. It is this—I said at the outset, but apparently not as clearly as I should have, that I did not know about that because it did not actually come to the Commission itself, and I would like to check.

Senator VANDENBERG. All right.

Mr. LILIENTHAL. My remarks have reference to the policy of the export of radioisotopes for research and medical therapy.

Senator VANDENBERG. Well, my remarks have to do with the day-to-day operation of the system, because you and I know of some instances in which the Military Liaison Committee has not been acutely active.

Mr. LILIENTHAL. I am sure that in the thousands of actions that are taken, not by the Commission but by its staff, that is probably an understatement.

I would like to read, if I may, Mr. Chairman, the whole of the letter referred to this morning by my colleague, Commissioner Strauss, a letter marked "Restricted," from the Department of State, signed by its Acting Secretary, Robert A. Lovett, dated August 28, 1947:

DEAR MR. LILIENTHAL: I have received your letter of August 27, 1947, addressed to the Secretary—

I should think we really should read the letter itself before the reply is read.

Senator HICKENLOOPER. Portions of that letter have been released by the Commission in its news release of a week or so ago; have they not, Mr. Lilienthal?

Mr. LILIENTHAL. No; I do not think the letter has been.

Senator HICKENLOOPER. Is that in connection with the report to the State Department of the proposal to release these isotopes and the State Department's reply, the Under Secretary's reply?

Mr. LILIENTHAL. I do not know the one to which you are referring.

Senator HICKENLOOPER. There was a portion of the State Department's reply to the Atomic Energy Commission which was released. That is on this subject of approving the isotope distribution, based upon the Commission's representations to the State Department, portions of that letter, being released in a news release from the Commission, I believe about the 24th or the 26th of May. Now, I do not know whether that is the same letter or not.

Mr. LILIENTHAL. The one I am referring to is the one to which Commissioner Strauss referred this morning. Whether or not that is the same one, I don't know.

Senator HICKENLOOPER. Well, my remarks of yesterday were carefully taken from the news release of the Commission itself. That is the letter I was referring to.

Mr. LILIENTHAL. This letter of August 27, 1947, to which, on the following day, we had a reply, was addressed to "Hon. George C. Marshall, Secretary of State, United States Department of State," and is a letter from the Commission which I signed, and it reads as follows:

MY DEAR MR. SECRETARY: The United States Atomic Energy Commission has approved a plan for the foreign distribution of radioisotopes to qualified users. There is inclosed a memorandum setting forth the factors which the Commission has considered in reaching the decision that this action is in the best interest of the United States.

That memorandum I should like to have also made a part of this record. This is marked "Restricted," Senator Hickenlooper.

(The memorandum outlining the distribution scheme referred to above is marked "Exhibit 13" and will be found in the appendix.)

Mr. LILIENTHAL (reading letter):

During the past year radioisotopes have been distributed to a wide variety of institutions within the United States with no restrictions other than those which concern health and the effective use of the materials. Our producing and distributing facilities are now more adequate to meet all national needs. Being assured that the current distribution program is sound and workable and that security has not been prejudiced, the Commission wishes now to take steps to make available certain selected radioisotopes to foreign doctors and scientists for therapy and research.

The most careful consideration has been given to the question as to whether or not the distribution of selected radioisotopes to scientists in other countries will adversely affect the national security. The Commission is of the opinion that the type of radioisotopes involved, in the quantities and under the conditions prescribed, will not contribute to atomic energy research in other countries except to the extent that radioisotopes are tools which can contribute to any nation's general scientific-research program. The view may be taken, therefore, that to this extent their distribution is detrimental to this country's welfare.

There is obviously an effort to weave into the letter some of the considerations adverse to the decision.

Returning to the letter:

It is the Commission's judgment, however, that the advantages the United States will gain from taking steps at this time to make available the use of radioisotopes for humanitarian purposes outweigh this consideration.

There is also inclosed a procedural outline of the plan.

Senator HICKENLOOPER. May I at that point ask if the statement that you just read, where the advantages of the United States would outweigh the consideration of possible detriment to the United States—it does not recognize that there are possibilities of detriment to the United States in the program, and it goes on a matter of balance. Is that what I am to understand from the statement in that letter?

Mr. LILIENTHAL. Well, our advisers have indicated that there was no detrimental effect. This is what I referred to in here, but we wanted to indicate, too, that Commissioner Strauss had been—that we had not been all of one mind in this matter, without going into the fact—without spelling this out, and I may add that we said, when Commissioner Strauss raised the question as to whether he might, appropriately, independently speak to the Acting Secretary of State about his views, of course we said that would be satisfactory, indeed, and I believe he did.

The CHAIRMAN. Mr. Lilienthal, right at that point, have you any indication or evidence as to whether Mr. Lovett talked to the Military Establishment independently, before he wrote this letter?

Mr. LILIENTHAL. My recollection on this is vague and unsatisfactory, and I would have to check.

The CHAIRMAN. It would be very interesting to see whether or not any memorandum of conversations between the Department of State and the National Military Establishment is in existence.

Mr. LILIENTHAL. I think this perspective of time blurs the situation to this extent: that this really was no serious question existing in the mind of the Military Establishment or we would have heard plenty about it from everybody.

I am sure the record will bear this out, but there have been so many things which have happened that I am not clear on it.

Even when there have been questions on the part of one or two members on this now seven-man group, they have not been slow to make their views known; and this, of course, is exactly right.

Continuing with the letter to General Marshall:

Inasmuch as this matter involves questions of foreign policy and relations of the United States with other governments, the Commission requests the concurrence of the Department of State in this action and would appreciate any comments and suggestions you desire to make.

This is the conclusion of the letter.

The reference involves relation with other governments and questions of foreign policy and is a reference to the fact and the practice that followed upon this of consulting with the Department of State whenever there was a question about shipment to a country about which there could be any question. That is the point I was trying to make, about the relevance of the country's being friendly or unfriendly, trustworthy or untrustworthy.

The reply, on the following day, August 28, 1947, was signed by the Acting Secretary, Robert A. Lovett, and reads as follows:

DEAR MR. LILIENTHAL: I have received your letter of August 27, 1947, addressed to the Secretary, in which you state that the United States Atomic Energy Commission has approved a plan for the foreign distribution of radioisotopes to qualified users.

I note that these valuable products of United States atomic energy plants will now be available in the service of mankind and that, to this extent at least, we are able to advance toward the beneficent use of this new force. This initiative should promote harmony and good feeling among nations.

Based on your assurances that this offer on our part does not prejudice our national safety, and in view of the checks and safeguards set up in the distribution scheme as you outline it in the enclosure to your letter, the Department of State sees no objection from the point of view of foreign policy.

Sincerely yours,

ROBERT A. LOVETT,  
*Acting Secretary.*

The distribution scheme ought to be made a part of the record, and it makes it rather clear that these are not secret matters, and that access to all laboratories, including the laboratory of the Military Research Establishment of Norway, is to be made to representatives of this country.

(The memorandum outlining the distribution scheme referred to above is marked "Exhibit 13" and will be found in the appendix.)

Mr. LILIENTHAL. The State Department does have a representative abroad who has access to this and other places where these radioisotopes are used, and other scientists.

Likewise, the results of the research in the Norwegian establishment, as in the case of all other research, whether medical or biological or industrial or basic science—most of it, a good part of it, is basic science—is publishable and not classified.

I should like, if I may, to complete this record and call attention to the views of two of my colleagues, who have since that decision—in fact, just recently in the case of Mr. Waymack; in the early part of this year, in the case of Dr. Bacher—have left the service of the Commission. These are Mr. William W. Waymack, of Des Moines, Iowa, and Dr. Robert F. Bacher.

Their views should be taken together with the views expressed in the memorandum by my colleague, Commissioner Strauss, this morning.

Commissioner Strauss has read from the synopsis or the paraphrase of the minutes up to the point in those minutes of August 19, 1947—this document is marked “Confidential,” and I should like to read—it has now been unclassified, and obviously these matters are, of course, no longer confidential, and they were classified at that time in that fashion. They are now declassified.

Reading from the declassified version:

.Mr. Waymack commented—

Perhaps I should read the first paragraph which was not referred to by Mr. Strauss this morning. It is simply an introductory paragraph:

Mr. Lilienthal called attention to previous discussions of the Commission—these were numerous—

regarding the foreign distribution of radioisotopes, and referred to a staff memorandum on this subject. He expressed the belief that the Commission should reach a decision at the earliest possible date regarding the foreign distribution of radioisotopes.

As you will see, this matter had been under consideration since January of 1947.

Then follows three paragraphs which go into the minutes in full, but which have been paraphrased by Mr. Strauss—four paragraphs by Mr. Strauss—no, five—in which he expresses his view:

Mr. Strauss stated that he was, apparently, the only member who was opposed to such action at this time, and commented that when he realized that fact some weeks ago he had attempted, but without success, to bring his thinking in line with that of other members of the Commission. He felt that the burden of proof is upon those who wished to export radioisotopes. He expressed the belief that, although the report referred to by Mr. Lilienthal covered many points, it did not in his opinion convincingly meet certain basic objections which he felt should be controlling in this matter. He indicated that some of the reasons that had been advanced on behalf of the foreign distribution of radioisotopes were briefly, that the Commission has the legal right to take this action; scientists abroad who are well disposed toward the United States would be ill-disposed toward this country if radioisotopes are not distributed abroad; there is little likelihood that the radioisotopes thus to be shipped abroad will fall into unfriendly hands or be used in research or other activities that will result in a military advantage to unfriendly governments; and we are, by shipping radioisotopes abroad, divulging no knowledge that would not otherwise eventually be discovered by the nationals of other countries.

Mr. Strauss stated that the record did not support the belief that foreign scientists were or are practically all on the side of the democracies in the inter-

national political argument, but that in many cases they worked as zealously for the "right" and the "left" as they did for democracy and that many are now working for possible unfriendly nations. This indicates that, until the satisfactory international control of atomic energy is secured, the United States should take no steps that might help scientists who may work for a possible enemy nation. He expressed doubt that it would be possible to buy the good will of foreign scientists by authorizing the distribution of radioisotopes abroad. The publication of the Smyth report was a gesture, partly motivated by this purpose, which was now apparently forgotten in the current demand for the export of radioisotopes. Good will cannot be permanently bought in this way.

Mr. Strauss further stated that, in connection with the point that our release of radioisotopes will merely make available what those countries will eventually obtain through their own efforts by the use of cyclotrons already existing abroad, he wished to point out that this was the type of reasoning that had also been instrumental in leading to the publication of the Smyth report. He pointed out that cyclotrons produce submicroscopic quantities of radioisotopes and that to obtain amounts comparable to production in our piles thousands of cyclotron-years would be required. He doubted that the Atomic Energy Commission should commit a serious breach of security comparable with that of the publication of the Smyth report until there has been a greater degree of peace and mutual understanding established throughout the world. He also expressed doubt that the proposed restrictions to be placed on the shipment of radioisotopes abroad could effectively present their use for unfriendly purposes or their divergence to unfriendly hands which might endanger our national security.

Mr. Strauss stated that he did not contest the point that the isotopes in question could not be used by other countries to produce atomic weapons, but felt that they would be useful as tools in biological research, metallurgical research, petroleum chemistry, and other areas which are a part of the war-making potential of nations.

Mr. Strauss also stated that although he was not competent to pass on the legal aspects of this problem, he believed that the intent of the provision in the Atomic Energy Act prohibiting the exchange of information with other nations with respect to the use of atomic energy for "industrial purposes" is clear, and that this lesser prohibition must include the greater one of possible military uses. He said, however, that he was content to accept the General Counsel's opinion as to the legality of the proposed action. He also called attention to the fact that during the Senate debate on the confirmation of members of the Commission, the President pro tempore of the Senate took the floor and, in reply to an allegation made earlier in the debate that the Commission would give away secrets to foreign countries, had reminded Members of the Senate that the Commission could not avoid the many requirements of the bill in this matter; that the appointments of the Commissioners ran for only about 1½ years and that there seemed to be no possibility of an international agreement regarding atomic energy within that time. For these reasons Mr. Strauss expressed his belief that the Commission should not approve the foreign distribution of radioisotopes.

Then, Mr. Waymack commented:

The international situation is not good.

I think that is a matter about which there could be no dispute.

The Marshall plan has become the No. 1 key to the policy of the United States. The shipment of radioisotopes abroad would be a small part of that plan. The adoption of a policy of denying anything that could conceivably fall into the hands of potential enemies or their satellites, does not seem reasonable. If this reasoning is applicable to radioisotopes it is also applicable to any action assisting the rebuilding of the nations of the world, and their industrial rehabilitation. The Canadians and British will soon be producing radioisotopes in their own reactors, and will undoubtedly make them available outside their respective countries. The United States should take the leadership in this matter rather than reluctantly follow the actions of Canada or Britain. By denying the foreign distribution of radioisotopes at this time the United States will be giving unfriendly countries a propaganda weapon that might be more hurtful to national security than would be any possible harm in the release of radioisotopes under appropriately safeguarded conditions. Conversely, the unfriendly propaganda accusing the United States of fostering a "plutocratic monopoly" of atomic energy could be offset if radioisotopes were distributed abroad.

Then, Dr. Bacher's views are recorded in the minutes:

Mr. Bacher pointed out that the Canadian pile is now in operation; the United States will want to take advantage of this by having certain materials irradiated in that pile from time to time; and that we will be in a position of asking for something from the Canadians that we are unwilling to give to them even though we have it, unless we authorize the distribution of radioisotopes abroad. He indicated that he concurred with the point made by Mr. Strauss regarding European scientists but expressed the belief that the situation was more complicated than appeared on the surface. There is a struggle going on in Europe which is evident among scientific people as well as those pursuing other occupations. We stand to lose good will in those places where we have had cooperation if we now continue to deny the distribution of radioisotopes to those countries. There seems to be a growing sentiment throughout the world against increasing isolationism in the United States. The continued prohibition against shipment of radioisotopes abroad is considered a symbol of such isolationism. The prohibition against such distribution does not seem to be in keeping with the foreign policy of the United States which is to help as much as feasible those countries needing rehabilitation. The foreign distribution of radioisotopes is relatively a small matter when compared with such major actions as the export of electric generators for use in connection with the Dneiperstroy Dam.

Mr. Strauss responded that there is no legal control and the Atomic Energy Commission has no primary concern pertaining to the export of generators, but added that he felt that the Government agencies that did have jurisdiction should prevent such exports. On the other hand, there is a law, which the Atomic Energy Commission is primarily responsible for executing, that provides for controls with respect to the byproducts of atomic energy. He also pointed out that the Marshall plan, which had not yet become the policy of the United States Government, was designed to encourage the short-run rehabilitation of certain other nations, while shipment of radioisotopes abroad could hardly be expected to produce results of such a character.

The CHAIRMAN. Mr. Lilienthal, there is on the statute books a general export control act under which the Commerce Department can prohibit exports; is that not true?

Mr. LILIENTHAL. That is correct, sir. I am looking forward to the time when the committee will have time to go into that whole policy and the practice of the Commission in that respect.

Senator MILLIKIN. May I ask a question, Mr. Chairman?

The CHAIRMAN. Yes.

Senator MILLIKIN. Mr. Lilienthal, did the Commission ever consider the specific question of exporting isotopes for their use in the metallurgy of weapons?

Mr. LILIENTHAL. Metallurgy of weapons?

Senator MILLIKIN. Yes.

Mr. LILIENTHAL. No; I am sure they did not. There is a reference in the General Advisory Committee's statement to us that radio iodine, in their opinion, may not be used in connection with the study of the production of plutonium.

Senator MILLIKIN. My immediate inquiry is the claim that Norway intends to use or could use these isotopes in connection with metallurgy of weapons, and I am, of course, driving to the point of whether the Commission ever specifically considered that point.

Mr. LILIENTHAL. I should say, so far as I know, never, and I am sure, I am confident I would recall it.

I would like, if I may, to observe, since Norway is again considered, that in Oslo, a source in Oslo representing the Norwegian Government, last night issued a statement, which I have seen only in the press, indicating that the research involved here is not military research, and I should like, before this discussion is concluded, and the chapter is

closed, to have discussed here, Senator, what I believe to be a misapprehension as to the relations of the use of radioisotopes, to wit, radioiron, in basic research, and its application.

I am advised that that is a great one indeed, and is about the relation of a tenpenny nail and the building of a chicken house.

Senator MILLIKIN. Before we get into that, let me ask you, did the Commission at the time that it approved this shipment know that Norway was not going to go into the metallurgy of weapon making?

Mr. LILIENTHAL. As I endeavored to make clear to Senator Vandenberg, the Commission—speaking now of the five Commissioners—did not have before it the question of this particular shipment. It has been considered since that time.

The information is in the hands of the staff, to whom it was delegated, under the Commission's procedure.

Senator MILLIKIN. I am very curious as to why a question of that importance was not passed upon by the Commission, but by the staff.

Mr. LILIENTHAL. Well, Senator, I am afraid we have failed to make our position clear; that the importance attached to it here is not one that was shared by our technical and scientific people, and I think myself, on the basis of their judgment, the use of radioiron in basic research in respect to iron and steel and its interdiffusion is a matter that has been under study, at least, since 1913, and does not represent any critical issue or any difficult issue.

Senator MILLIKIN. The issue is whether we should furnish the isotope for the purpose.

Mr. LILIENTHAL. Yes.

Senator MILLIKIN. That is, I suggest, a critical issue, and is the issue before us.

Mr. LILIENTHAL. Yes, it is; but the background—you asked the question of why the Commission itself did not regard it as a critical issue.

Senator MILLIKIN. We did not have an atomic energy business in 1913, and you did not have the Atomic Energy Act in 1913.

Mr. LILIENTHAL. Well, I would like to have for the Senator immediate information on this subject, so that he could see that the reason why we did not regard it as important, and that will come from technical people. Some of them have said ordinary iron would be just as good for this diffusion problem.

Senator MILLIKIN. Do you not see that that answer is irrelevant? The sole question is whether we are using that which is under the control of this act in any possible way to aid in the development of weapons by other countries, friendly or not, and it has nothing to do with whether it can be done in some other way.

Mr. LILIENTHAL. But this discussion, Senator, I respectfully suggest, cannot be carried on in a vacuum, without these facts, and it is these facts to which I refer as to whether this assists or not.

Senator MILLIKIN. You are throwing in facts that are completely outside of the jurisdiction of your Commission. Let us assume that a friendly or unfriendly country could do this in some other way; let us assume they have been working on it for 50 years: Your question of responsibility is, should you aid the enterprise by letting it get materials which it is contended you have no right to let go of.

Mr. LILIENTHAL. Senator, I simply would like to say—

Senator MILLIKIN. The point, if I may make one further observation, is fully covered, I suggest, by Mr. Strauss' comment that you have no responsibility over sending generators. We have a lot of items in the papers lately about all kinds of stuff going over there. You have no responsibility for that, but you do have responsibility for fissionable materials.

Mr. LILIENTHAL. Yes, Senator. The point is, if I may make it, and I hope it will be later developed by scientific and technical people, that you are assuming, if I may say so, you are assuming what, we believe, will not be borne out by the facts, that this material is being used, or could be used, for weapons.

Senator MILLIKIN. I am not assuming anything. I am waiting for facts, and I do not receive them when I am told about how this thing could be done in other ways, how it could be done with other energies, how it has been the subject of thought since 1913.

I am receiving no help, Mr. Lilienthal; if I have an assumption, I am perfectly willing to abandon it when I get some facts which are relevant.

Mr. LILIENTHAL. That is, Senator, if I may say so, the whole point in my remarks, that the facts, we believe, will make it clear that the conclusion that this assists in weapon production and jet-plane production and so on is not well founded to any extent that is worthy of elevating this matter to a position of importance.

I say these are the facts about how this may be used. The difference between research and basic metallurgy and the production of jet engines and steel and conventional armament is a question of fact. The fact, I hope, will be adduced, and then, I think, we will have reached the question of whether there is really a difference of opinion. I do not believe there is.

Senator MILLIKIN. I hope to goodness that you get at it, Mr. Lilienthal.

Mr. LILIENTHAL. I am not qualified to do it, but I could transfer this chair to others who could; but I would like, before doing that, to complete the reading of these minutes.

The CHAIRMAN. Mr. Lilienthal, it is a quarter of one. Could you complete that in just a few minutes? Some of us who have engagements must leave so that we can attend to them.

Mr. LILIENTHAL. It is not very long. It is slightly over a page of single space.

The CHAIRMAN. When you get through we will recess.

Mr. LILIENTHAL. Yes, sir.

Senator KNOWLAND. Mr. Chairman, just before he continues, because it may help to clear up something in my mind, on the decision which passed the responsibility for enabling the staff to make the decision in regard to this particular Norway shipment; was that done at the time the decision was made on the shipments of isotopes generally or at a later date did the Commission again meet and say that as long as they are limited to this list of countries the staff is free to make such decisions as in their judgment are warranted of the shipment of isotopes, regardless of the purpose for which they are being put? I would just like to clear up that point, whether there was an independent action of the Commission in delegating responsibility to the staff.

Mr. LILIENTHAL. My recollection, Senator, is that at the time the Commission, over this long period of months, finally took its action, that it had before it a staff paper, the procedures of which, recommended therein, were adopted as to how this program should be administered, and that subsequently, I am sure, that was probably modified to some extent; and I would like to get into the record both the procedure and its modification which I do not have in mind.

I do recall at this moment—in the case of some countries, countries that would not receive shipments—this again illustrates the relevance of the kind of country—the Commission itself would have to be reconsulted before action would be taken.

Then, I think in the case of all countries except those where we were already advised of the views of the State Department, the State Department would have to be consulted about the status of that country in respect to foreign policy, and that, if a question were raised at that point, then it would come to the Commission. But where no such questions were involved, the administration of the program will be delegated.

(An outline of procedures for the foreign distribution of radioisotopes established within the Atomic Energy Commission on October 10, 1947, is marked "Exhibit 14" and will be found in the appendix.)

Senator MILLIKIN. Mr. Chairman, may I ask one brief question?

The CHAIRMAN. Yes.

Senator MILLIKIN. Why did you deny the application of Finland?

Mr. LILIENTHAL. Senator, we did not deny it.

Senator MILLIKIN. What happened to it?

Mr. LILIENTHAL. My recollection is that we asked the views of the State Department in respect to Finland. A great deal of discussion went on, and time elapsed, and in the case of the first application, by the time we had made up our minds to make this shipment, the Finns had secured this material from Britain. There were thereafter other shipments to Finland in which the questions have been disposed of by the State Department.

Senator MILLIKIN. From us? We made shipments to Finland?

Mr. LILIENTHAL. That is correct. These are in the monthly reports referred to.

The CHAIRMAN. Mr. Lilienthal, are you sure that any shipment was finally made to Finland? Our staff memorandum on this subject indicates that the original shipment was canceled by the Finns because they got it from the British, but I do not see any notation to the effect that subsequent shipments went forward.

Senator HICKENLOOPER. I put that in the record yesterday. Shipments to Finland, outside of this, there have been three shipments to Finland.

The CHAIRMAN. I beg your pardon. There was 1 millicurie of calcium 145; 1 millicurie of cobalt 160, and 1 millicurie of zinc 65, and then there was one request for a millicurie of another material which was not shipped because that was not on the approved list.

Mr. LILIENTHAL. I do not keep up with these shipments, but I do try to keep up with the procedures, and where questions are raised, I am simply repeating the information as to Finland.

The CHAIRMAN. That was my mistake. There were three.

Senator HICKENLOOPER. On the original shipment, if I may, Mr. Chairman, the original request for this large amount shipment for Finland, did not the Commission authorize the shipment, that is, grant the request of Finland, and then prescribe certain conditions, and when those conditions were made known, the Finns withdrew their application?

Mr. LILIENTHAL. No, I believe not. My recollection, Senator, is that the amounts requested led to a more detailed inquiry as to what they planned to do with it. It became evident that they did not really know too much about the technical use of radiophosphorus and the inquiries were directed toward that intended use, as required by the procedure.

Senator HICKENLOOPER. Do you know whether they obtained the same thing, the same material that they asked for—I do not know about the quantity—whether they have obtained it since from Great Britain?

Mr. LILIENTHAL. My recollection is that they have, but the discussions with them made it clear, too, that for the purpose they had in mind they were asking for more than they needed.

Senator HICKENLOOPER. Yes.

Senator MILLIKIN. Mr. Chairman, I hate to press this, but I would like to ask one more question.

Is it the Commission's contention that these isotopes are useless so far as advancing metallurgy of weapon-making is concerned?

Mr. LILIENTHAL. I would have to ask a technical man that, but our advice is that these isotopes which are released relate to basic research and will not advance the application of the research to the metallurgy of weapons. That is my understanding.

Senator HICKENLOOPER. I do not think the answer is quite responsive. If it relates to basic research and if it establishes under basic research the theories which can be advanced by actual metallurgy and actual industrial processes, we are quibbling about things which have no real distinction in them.

Mr. LILIENTHAL. Senator, I think my difficulty is that the term "useless" is so broad.

Senator MILLIKIN. Take your own term.

Mr. LILIENTHAL. Well, here again I think, in the absence of the facts—

Senator MILLIKIN. Let me put it to you in terms of "useful." Is it the Commission's contention that the isotopes, with specific reference to the Norway situation, would not be useful in advancing the metallurgy of weapon-making?

Mr. LILIENTHAL. I am advised, Senator, and I believe in the soundness of this advice, that these isotopes we are referring to in the Norwegian shipment are, as far as possible, as far as imaginable, is the term, from their usefulness to the production of weapons and improvement of weapons as is possible to imagine.

Senator MILLIKIN. Again, I think, Mr. Lilienthal, you are drawing a distinction between research and final production.

Mr. LILIENTHAL. Of course.

Senator MILLIKIN. I am regarding them as all in one causative chain. Now, are we both talking about the same thing? Is it your contention that the research may not lead to production or has no necessary relationship to production?

Mr. LILIENTHAL. It has no necessary relation to production.

Senator MILLIKIN. But could it be useful later on in production?

Mr. LILIENTHAL. But no more so than a microscope or anything else.

Senator MILLIKIN. All right. That brings us right back to that point that we are not considering the microscope, and you have no responsibility for the microscope.

Mr. LILIENTHAL. Senator, I am sure that when you have heard from scientists on the relation between research use of these isotopes and application, and what a broad and completely illogical gap there may be, that you will be of the same mind that I am that there is no relationship worthy again of the term.

Senator MILLIKIN. Let me ask you again, Mr. Lilienthal, is there an insurmountable gap?

Mr. LILIENTHAL. There is nothing insurmountable in the physical world.

Senator MILLIKIN. Is it a gap which can be crossed if there is a desire to cross it?

Mr. LILIENTHAL. Senator, these are hypotheses that one does not use in ordinary life, and to ask for absolutes in a world such as we live in, I think, is really unrealistic. There is a relation between everything, and I would be—

Senator MILLIKIN. I understand, do not give me a lecture on that. I understand.

Mr. LILIENTHAL. This is so abstract that I do not see how we could avoid abstractions.

Senator MILLIKIN. Mr. Lilienthal, are you basing your claim that the research may not lead to production?

Mr. LILIENTHAL. The research is so remote, as I have been advised, as not to be within the realm of probability in which we live, and on that the facts will make it very clear.

Since we are talking about abstractions, unfortunately, rather than in a context of facts, a good deal of what I say is abstract.

When we get the facts, I think you will see more clearly why I do not think there is a relationship worthy of that name.

Senator MILLIKIN. I am trying hard to figure the facts when you produce them, and that is why I am asking the questions, and I assume that you will produce facts to show that there is an exceedingly improbable relationship of whatever might be developed in the research to the later possible production of weapons, is that correct?

Mr. LILIENTHAL. That is what I am trying to say.

Senator MILLIKIN. Yes.

The CHAIRMAN. Now, Mr. Lilienthal, I think that I will have to ask the committee, unless the committee should think otherwise, that when the clock says 1 o'clock, hereafter, we are going to recess, no matter where we are at the moment, because otherwise it disarranges our whole day.

Mr. LILIENTHAL. I will continue, this is not very long, but I would like to get it all into the record.

The CHAIRMAN. This is in no sense blaming you, because you have been answering questions.

I am just saying that we have to adopt a different policy, different from sitting here until 1:30.

Mr. LILIENTHAL. Yes.

Continuing with these extensive minutes on our meeting of August 19, 1947, which was at Bohemian Grove, Mr. Pike pointed out—

Mr. COLE. Where was that?

Mr. LILIENTHAL. In the redwoods of California, where the Commission was holding a meeting with its Research Director, Bohemian Grove.

Mr. COLE. I misunderstood you. I thought you said Cocoanut Grove, Los Angeles.

Mr. LILIENTHAL. I thought, perhaps, that you thought I had said "Bohemia," which would be even worse.

(Laughter.)

Mr. LILIENTHAL (reading) :

Mr. Pike pointed out that the proposal before the Commission placed certain restrictions on the foreign distribution of radioisotopes by providing that foreign governments whose research workers request radioisotopes must agree: to make progress reports to the Commission periodically on the results of their work with the radioisotopes and to permit publication of reports regarding such work; to insure that the radioisotopes are used for the purpose stated in the requests, which must be approved by the Commission prior to shipment, in the same manner as domestic requests; and, to permit qualified scientists of any nationality to visit institutions where the materials will be used, and to obtain information freely with respect to the purposes, methods, and results of such use in accordance with well-established scientific tradition. He—

that is Mr. Pike—

expressed the belief that these provisions would amply protect the interests of the United States, and would prevent the misuse or divergence of the isotopes involved. He also pointed out that all radioisotopes are not involved in the proposal. The proposed foreign distribution does not include materials applicable to the development of atomic energy for military or industrial purposes. No naturally radioactive materials and no isotopes of any elements of higher atomic number than element 83 (bismuth) are included.

This is the final paragraph :

Mr. Lilienthal referred to the materials and points included in the staff report on this subject, and expressed the belief that the matter had been well and carefully weighed in that report with the final conclusion that it is to the best interests of the United States Government to authorize the foreign distribution of radioisotopes at this time. He referred to the conditions that must be met by foreign governments and the recipients of radioisotopes before the Commission would authorize shipments abroad and expressed the belief that these furnished adequate safeguards against the abuse or misuse of the materials thus made available outside the United States. Mr. Lilienthal also stated that scientific knowledge would be greatly advanced by making radioisotopes available to foreign scientists. Certain "road-blocks" in the treatment of cancer, for example, might be broken by making it possible for foreign scientists to take part in the attack on the disease. Even knowing that the United States is taking some risk in connection with its policy of encouraging the rehabilitation of Europe that may result in the strengthening of potential enemies it is, nevertheless, a chance that must be taken for the building of an enduring peace. Although there may be upsets in Europe, nevertheless, the Marshall plan is designed to strengthen what can be friendly and peaceful countries. The foreign distribution of radioisotopes becomes a small part of this broad policy. Mr. Lilienthal expressed some doubts regarding the validity of the argument that it would be possible to win friends by releasing radioisotopes abroad, and stated that any action in this matter should rest more importantly on the fact that this is the best way of fostering the advancement of science and knowledge.

After further discussion—  
that is an understatement—

it was agreed by a vote of 4 to 1 (Mr. Strauss voting in the negative) that the Commission's recommendation and reasons for favoring the foreign distribution of radioisotopes would be forwarded to the Department of State for consideration by that agency, and that at the same time the reasons that have been advanced against such action would be presented for the Department's consideration. It was similarly agreed that if the Department of State should approve the recommendations of the Commission, the foreign distribution of the radioisotopes listed in the staff report would be authorized.

This is followed by the certification of the Secretary and approved by the Commission, the minutes themselves approved by the Commission December 10, 1947.

The CHAIRMAN. Now, Mr. Lilienthal, I have received a short note from Mr. Strauss which, I think, I should read into the record. He says:

DEAR SENATOR McMAHON: In order that there may be no inference in the record that I withheld information from the committee in giving only my views this morning rather than those of my colleagues and even having to paraphrase my own remarks as they appear in the minutes in question, I should like to make it clear that the minutes in question were classified as recently as last night, and that I did not have the prerogative to declassify them. It must have been declassified this morning.

That is signed "Lewis Strauss."

Now, tomorrow morning we will meet here at 10:30 for further proceedings. The committee will meet in executive session to try to obtain the settlement of the troublesome matters at 3:30 this afternoon.

Senator HICKENLOOPER. Mr. Chairman, I may say that, in advance, the decision of the committee on the matter of my presentation of the security files will have a very vital effect on my ability to proceed tomorrow if the committee expects me to proceed.

Mr. LILIENTHAL. Mr. Chairman, in case it does not become feasible for Senator Hickenlooper to proceed tomorrow, may we proceed with that part of the affirmative presentation of the accomplishments of the Commission which we requested, in asking for this investigation? That is, in the event that Senator Hickenlooper is not prepared, so that we may get witnesses ready and put them on in that regard with respect to an affirmative presentation?

The CHAIRMAN. That is a decision which will have to be made by the full committee. I personally am anxious that we hold daily sessions and get along with this business just as quickly as we can, because I am conscious of the fact that the longer this investigation will run, the longer you are, of course, going to find it impossible to pursue your regular work. I shall take it up in the executive meeting today, and we will advise you. But until further notice, we will have a meeting here at 10:30 tomorrow morning.

(Whereupon, at 1:30 p. m., the joint committee adjourned, to reconvene at 10:30 a. m., Friday, June 10, 1949.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

MONDAY, JUNE 13, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment and subsequent postponement, at 10:35 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon (chairman), Representative Durham (vice chairman); Senators Connally, Tydings, Vandenberg, Millikin, Knowland, and Hickenlooper; Representatives Holifield, Jackson, Cole, Elston, and Hinshaw.

Also present: David E. Lilienthal, Chairman; Sumner T. Pike, Commissioner; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Dr. J. Robert Oppenheimer, Chairman, General Advisory Committee; Carroll L. Wilson, General Manager; Dr. Walter F. Colby, Director of Intelligence; David B. Langmuir, Executive Secretary, Program Council; Joseph Volpe, Jr., General Counsel; Everett Hollis and Bennett Boskey, of the Office of the General Counsel; Dr. Kenneth S. Pitzer, Director, Dr. Ralph Johnson, Associate Director, and Dr. Spofford English, Division of Research; Dr. Paul B. Pearson, Division of Biology and Medicine; Fletcher C. Waller, Director, Division of Organization and Personnel; Morse Salisbury, Director, Rodney Southwick, and Shelby Thompson, Division of Public and Technical Information Service; Francis Hammack, Acting Director, and Edward Brosman, Division of Security; Frances Henderson, Assistant to the Chairman, all of the United States Atomic Energy Commission.

The CHAIRMAN. The committee will come to order.

Dr. Oppenheimer. Good morning, Doctor.

Dr. OPPENHEIMER. Good morning.

The CHAIRMAN. Doctor, before you start, I want to make a comment on an action the joint committee took the other day relative to closed hearings of personnel security cases. I did not get you in that chair to take part in this discussion. This is simply my own announcement.

I want to make it perfectly clear that there is not a member who voted in the minority who, in my opinion, is for full and open hearings on the personnel security cases. If there is anyone who is of such a mind, why, they can make it known for the record now.

The choice was between a part of an open hearing and a full closed hearing, not a full open hearing at all. I want to make that perfectly

definite for the record. Not even the proponents of these charges have at any time asked this committee to hear these personnel cases, all of them, wholly in open session.

Mr. JACKSON. Mr. Chairman?

The CHAIRMAN. Mr. Jackson?

Mr. JACKSON. I am glad the chairman has made the announcement that he has made this morning in connection with the personnel security cases.

I think that in order for the record to be clear on this matter, the committee should meet in executive session this afternoon, and I propose to reiterate my previous announcement in public in these hearings to the effect that these matters either ought to be all in public or all in executive session.

The CHAIRMAN. You mean by that the security cases?

Mr. JACKSON. The security cases, yes; and that that matter should be disposed of by appropriate means, if we do have an executive session this afternoon.

The CHAIRMAN. I believe the reasons that motivate every member of the committee to be unwilling to proceed on total open hearings and the total files is primarily because of the irreparable injury that would be done to our investigating agency.

Mr. JACKSON. Mr. Chairman, no one wants to do any harm to the great work of the FBI, but, on the other hand, if we are confronted with a situation here of charges being made in public and no opportunity to reply in public, I think that is important.

At the same time, I am sure every member of this committee wants to do his part in seeing to it that the investigative work of the FBI is not jeopardized.

I would be the last to propound or to offer any motion that would result in that end.

The CHAIRMAN. I am sure of that.

Mr. JACKSON. Yes.

**STATEMENT OF DR. J. ROBERT OPPENHEIMER, DIRECTOR, INSTITUTE FOR ADVANCED STUDY, PRINCETON, N. J.; CHAIRMAN, GENERAL ADVISORY COMMITTEE TO THE ATOMIC ENERGY COMMISSION**

The CHAIRMAN. Now, Doctor, we have had some discussion here about radioisotopes and the export of them. You are chairman of the General Advisory Committee?

Dr. OPPENHEIMER. I am, sir.

The CHAIRMAN. You were director of the Los Alamos Laboratory during the war?

Dr. OPPENHEIMER. I was.

The CHAIRMAN. Doctor, I am familiar with your history and your background, but I think it would be well if you were to state for the record what that is.

Dr. OPPENHEIMER. My present job is director of the Institute for Advanced Study, which is in Princeton, N. J.

Before the war, I held joint appointments in physics at the California Institute of Technology, Pasadena, and at the University of California in Berkeley.

My first full-time official employment on the atomic bomb project came in the spring of 1942 when I was put in charge of the development of the bomb task then assigned to the Metallurgical Laboratory in Chicago.

About 6 months later, General Groves and I started talking about Los Alamos, and early in 1943 I was formally appointed director.

I resigned 2 months after the war was over, and have since served in an advisory capacity only, the principal one at present, the one I guess in which I am here today, is as chairman of the statutory General Advisory Committee. Is that enough?

The CHAIRMAN. Now, you are at Princeton?

Dr. OPPENHEIMER. I am at Princeton now.

The CHAIRMAN. You are still connected with the project—working in nuclear physics, however, are you not, as well as being chairman of the General Advisory Committee?

Dr. OPPENHEIMER. We are working at the Institute not entirely, but largely on basic problems whose connection with practical aspects of atomic energy is not too clear, but which we hope and really know will in one way or another be useful in the future.

The CHAIRMAN. Now, doctor, we have been talking about radio-isotopes. We have been talking about their export, and we have been talking about the policy. First, we talked about what the law meant. I would not expect any interpretation of that from you. We can get that from the lawyers, but we have been talking about the wisdom or the lack of it in exporting these shipments. Our talk has become more concentrated now on the Norway shipment with which, I presume, you are familiar.

Doctor, will you go ahead and tell the committee what your thoughts are on this policy.

Dr. OPPENHEIMER. I will be glad to try to do so.

The General Advisory Committee has been, I would say, less equivocal on the subject of the limited export of isotopes than on almost anything else that has been referred to it.

It at least twice has considered the problem. Each time it has come up with a firm and unanimous answer. The records of our deliberations are in your hands; some are public, and they are all available to you.

I think it important at this point to emphasize that in our first formal discussion of the foreign distribution of isotopes we told the commission that we regarded their program as somewhat too conservative; that we hoped that the problem of the export of certain fission products and of stable isotopes could be considered at a later date, but we were very glad to see that something was being done.

Since we have been so unequivocal, I believe it right to try to give you the background that was in my mind, and I believe, in the minds of the General Advisory Committee, in making these deliberations. Let me say first that you have every reason to want to ask me questions and to expect candid answers, and you are not here for a lecture. If I am talking about things that you already know or that are irrelevant, I hope you will cut me off.

What I would propose to do, since so many of the affirmative arguments have been given, is to take up the argument that the present policy involves some kind of danger; specifically that it involves danger of assisting other nations in the development of atomic energy,

and that it involves the danger of assisting other nations in other military developments. These are two points I want to speak to.

Before I can do that, I think I may briefly outline the history of isotopes, what they are, how they are used, and in what way their export is circumscribed. If you have no objection, I will do that.

We are all, of course, composed of isotopes. They were discovered in the early part of the century by the English physicist, Aston. Shortly thereafter it was recognized that some isotopes, very heavy materials, were radioactive. This meant that at more or less at random, but on a fixed over-all schedule, they would undergo a change which signaled itself by the emission of a radiation which was easy to detect.

Taking advantage of that, the Hungarian chemist, Hevesy, who now works in Scandinavia, showed that one can use radioactive isotopes as tracers. This is the principal use with which we are now concerned.

The way a tracer works is that: Two materials which are isotopic with each other have essentially the same chemical behavior. If it is sulfur you are dealing with, all isotopes of sulfur will follow the chemistry of sulfur. If the material is radioactive, at a certain stage, having followed the history of sulfur, it will suddenly do something quite new; it will explode; it will disintegrate, and if you have the right kind of detecting equipment you can find out where it was at that time. In this way the very, very complex problems of chemical systems, of biological systems, of crystals, of metallurgical systems, can be explored. This is not a unique instrument, but it is an important one.

The radioactive isotopes increased very much in importance with the discovery in France early in the thirties that you could make ordinary materials radioactive, that you could get radioactive carbon, radioactive sulfur, radioactive oxygen; of course, few people are interested in the basic behavior of radium in the human body, but many people are interested in the behavior of carbon or oxygen.

The decade before the war saw innumerable examples, both of the discovery and of the application of isotopes. Much of this work was done in this country; some was done abroad.

I remember about 10 years ago, the distinguished Director of the Radiation Laboratory in Berkeley had to give a public lecture, and he wanted to use me as a guinea pig. He got me out on the platform, and he got me to put my hand around a Geiger counter, which is one of the instruments for detecting radioactivity, and he asked me to drink a bit of water in which a part of the salt had radioactive sodium in it.

For the first half minute all was quiet, but about 50 seconds after I drank it there was a great clattering of the Geiger counter. This was supposed to show that at least in one complex physiochemical system, the salt, the sodium ion had diffused from my mouth through my blood stream to the tip of my finger, and the time scale for this was 50 seconds. That is a prototype of one of the uses.

(Discussion off the record.)

Dr. OPPENHEIMER. The atomic energy project made a great change in the isotope situation, and in the following way: In the first place new heavy isotopes were discovered, the most famous being plutonium.

In the second place, the vast and otherwise often inaccessible array

of radioactive materials from the fission process itself became available.

It is important for me to emphasize that the export program of the Commission does not include any of the heavy materials specific to the fission program. It does not include the fission products specific to the fission program.

The CHAIRMAN. Fission what?

Dr. OPPENHEIMER. The fission program, atomic energy program.

The CHAIRMAN. Oh.

Dr. OPPENHEIMER. It includes only those materials made by neutron bombardment, I believe all of which were well-known before the war, and which can be made by a variety of methods.

The great contribution of the United States atomic energy program to this work is that the quantities available and the cost have been changed. The quantities are enormously greater, the cost very much smaller.

The specific purposes for which the General Advisory Committee recommended the export of isotopes were for basic research, not only in medicine and in biology, but also in physics, in chemistry, in metallurgy. Basic research means research directed toward finding out about the nature of the world rather than research specifically directed toward achieving a practical goal. If you want to find out how strong nuclear forces are, that is basic research. If you want to design a reactor, which will propel a certain kind of craft, that is not a basic research; that is applied.

These are loosely used words, but that is what we had in mind.

The second purpose is for diagnosis. If human metabolism or animal metabolism is disturbed by disease, the way in which the body used certain things, iodine, for example, will be altered.

If you follow radioactive iodine, you may be able to find out what kind of an illness a man has.

The third purpose is therapy. The therapy is on a very limited scale. For years people have been looking for diseases that radioactive materials would cure, and I think two have been found: Certain thyroid disorders and polycythemia vera. On a world-wide scale, this means quite a number of human lives.

This is background of information which the General Advisory Committee had as to the history of isotopes.

Let me turn to the special problems of the use in atomic energy, and the use in other military applications, and the extent to which the use of isotopes abroad could be controlled by us and could be favorable to us.

I need to say, first, that all the isotopes here considered are isotopes which would exist and which would be useful if there were no uranium, if the fission process were impossible, if the number of neutrons emitted were too small to sustain a chain reaction, or if the Government of the United States had not allocated a nickel to the atomic energy program.

On the use of these isotopes, and I leave out plutonium and fission products, because there are other factors which are involved in the development of atomic energy, I can testify as follows: At Los Alamos we never made use of these materials. I cannot speak with the same sharpness about the metallurgical laboratory in Chicago, and the radiation laboratory in California, but no use of these materials suffi-

ciently interesting or important to come to my attention was made. I know of no such use, and it was certainly ancillary.

Senator HICKENLOOPER. Dr. Oppenheimer, what were you interested in at Los Alamos?

Dr. OPPENHEIMER. In making bombs, sir.

Senator HICKENLOOPER. Were you interested in high-speed steel for engines?

Dr. OPPENHEIMER. We will come to that later. We were interested in steel. You will soon get me to the point where secrecy does stop my answer.

Senator HICKENLOOPER. But your former interest was making a bomb?

Dr. OPPENHEIMER. Our exclusive interest was making a bomb, but you have no idea how many angles that can have. We will come back to the engines.

Senator HICKENLOOPER. All right.

Dr. OPPENHEIMER. The next point that I would like to make is that since the war I can recollect no application of these exportable isotopes to the atomic energy program of sufficient importance so that it came to the attention of the General Advisory Committee.

No one can force me to say that you cannot use these isotopes for atomic energy. You can use a shovel for atomic energy; in fact, you do. You can use a bottle of beer for atomic energy. In fact, you do. But to get some perspective, the fact is that during the war and after the war these materials have played no significant part, and in my own knowledge, no part at all. That is not true of all isotopes. Plutonium is a good one; that played a big part. It is true of the group of isotopes falling under the Commission's export policy.

Now, you have asked about other military applications. Here I am less knowledgeable, but the General Advisory Committee is collectively a very knowledgeable group, and we have had this in mind.

The statements that I made about the possibility of using a shovel for military purposes also apply here.

However, the principal characteristic of military use is that you do the work in secret, and one of the conditions for the use of these isotopes is that it be open and published, and subject to visit.

Going beyond that, I have had a search made to see what use we have made of these exportable isotopes in secret military research. We have made about 6,000 shipments of isotopes. I would argue that the defense effort and the research defense effort in the United States is of another order of magnitude of bigness than any efforts that are going on in western Europe, and I thought that we would probably find some cases where the National Military Establishment had requested for secret application to armament, jet engines, bacteriological warfare, or what have you, these exportable isotopes.

To my astonishment the staff of the Commission has come up with an answer that they have no recorded case. This seems to me a very strong argument.

There are few, if any, situations in which this country, with its \$15-billion-a-year armament program, has found it possible to use these isotopes effectively in furthering our enormous defense establishment.

The next point that I would like to make is that it is, of course, not within our power to deny these materials to Europeans. They are available, not in every country, but in the collective area of western

Europe, from the British piles, and perhaps to a small extent from the French reactor, from cyclotrons which are spotted around, and from other accelerators. They are costly and they are a nuisance, but they are available.

Why, then, should we provide them at all? Well, I would say that that if there were a genuine military need, let us say, for radioiron or radiosulfur, that would be the need that would first be filled in a country which was concerned with military armament. What we are doing is making material available for the basic things which are not of high priority, and which contribute to general learning.

We are in a very good position, if discoveries are made in Europe, to profit by them. We are in a better position than the Europeans are because of our advanced technology, our good organization, of all the reasons which you know so well, in facing the problem of the rehabilitation of Europe.

The atomic bomb itself is based on fundamental published findings of European scientists, but it is not the Europeans who have the atomic bomb; it is the United States.

I am not saying that such discoveries will be made with these isotopes, but discoveries bearing on human health, bearing on the properties of materials, very likely will be.

These things were discovered in Europe; they were applied in Europe; they are available in Europe, and the positive arguments for making them available have been largely laid before you, and I do not want to repeat them. They lie in fostering science; they lie in making cordial effective relations with the scientists and technical people in western Europe; they lie in assisting the recovery of western Europe; they lie in doing the decent thing.

I am now going to speak as an individual and not on behalf of the General Advisory Committee. If you were to ask me the basic affirmative reason for distributing isotopes abroad, I would put it in these terms: There are many objectives of the United States foreign policy, that appear from the pronouncements of the Congress and the President and of the Secretary of State. One of them is that in the event of war we should be in a stronger position, and our enemy in a weak position. One of them is that we should have good trade relations. One of them is that we should enjoy the respect of as many of the people in the world as possible. But the two paramount objectives, as they emerge from public pronouncements, are the maintenance and extension of the basic freedoms to which this country is dedicated and on which it is built, and the preservation of peace.

I believe that the shipping abroad of isotopes is one of those many cases where it is right to reckon with the possibility that in these high objectives we will not fail.

Senator TYDINGS. Doctor, might I ask a question while this lull is on here so that I can clear up a little of my own thinking?

Dr. OPPENHEIMER. Suppose you do.

Senator TYDINGS. Suppose that any of these isotopes that have been shipped abroad have been shipped directly, let us say, to Russia, a great country and a potentially rich country. Could it have taken those isotopes and used them in any manner, shape, or form so as to accelerate its discovery of atomic fission, as we know it in this country from the atomic bomb, or in aiding its military potential?

Dr. OPPENHEIMER. Under the conditions of export, the conditions of export are that the work must be open, must be published, and must be accessible to qualified scientists, irrespective of nationality.

Senator TYDINGS. Let me put it to you this way: Suppose that Russia got some of these without complying with the open characteristics—

Dr. OPPENHEIMER. Right.

Senator TYDINGS (continuing). That you have in mind. To what extent, if any at all, would Russia then have improved its military potentialities actually or from the standpoint of possibilities?

Dr. OPPENHEIMER. Well, I have answered that the best I know how. We have not made very extensive use of these materials, either for the military applications of atomic energy or for any other military applications. I am not willing to grant that the Russians are so much smarter than we are, but, of course, I do not know. It is an iron curtain, and not iron 59 either.

Senator TYDINGS. Your answer, I take it, would be that even though we had shipped directly these isotopes to Russia, the inference is that Russia could not have employed them to advance the knowledge—

Dr. OPPENHEIMER. I would like to put in the word "substantially" just to protect the balance of the thing, but essentially that is right.

Senator TYDINGS. There would be a degree then to which your qualification—it would be a minor degree, but there would be a degree of aid?

Dr. OPPENHEIMER. Let me put it this way: I know of no way in which they could.

Senator TYDINGS. What is that?

Dr. OPPENHEIMER. I know of no way in which this would help them, but I do not know anything about Russia.

Senator TYDINGS. Thank you.

The CHAIRMAN. Doctor, you may feel as though you have more or less covered the Norwegian shipment in your general statement, but inasmuch as that was concretely before us and was the subject of rather extensive examination, would you please proceed to comment on this specifically?

Dr. OPPENHEIMER. I will. I learned of it really only as a result of its coming to public attention, and my knowledge of it is limited.

Senator HICKENLOOPER. Then, the matter had never been specifically submitted to the General Advisory Committee?

Dr. OPPENHEIMER. No; no specific shipment of isotopes has been.

The CHAIRMAN. Except the classification, Doctor. You say no specific shipment, that is true; but it is also true that you not only passed upon the general policy but you also laid down the general categories which should not be shipped.

Dr. OPPENHEIMER. No, that is not so. They were presented to us by the Commission. In many cases we understood the reason for the dividing line. In any case we approved of the Commission's dividing line with the suggestion that it could later be liberalized in certain directions.

The CHAIRMAN. Have you found an indication in your examination of the classifications that have been shipped to criticize those classifications or to criticize any particular shipment?

Dr. OPPENHEIMER. No, we have not; and I believe that the most we would say is that there are probably some materials which could safely

be shipped, and which are not included, for one reason or another, in the shipping list that the Commission puts out.

As to the Norwegian matter, my understanding is the following: It was shipped to a national defense establishment, and this is the most damaging thing that could be said about it. This national defense establishment appears to have two functions: On the one hand it does military research. I do not know on what, and I do not know whether it is secret or not.

On the other hand, it is a contracting agency for the industries of Norway. The problem for which this shipment of radioiron was desired was the study of the diffusion of iron into low-iron alloys. This is a basic problem in metallurgy which is being studied on an open basis in several centers, Stevens Institute, Carnegie Institute, and one other place in this country, open and publishable.

The reason why the industry had an interest in the matter was in order to improve the performance of turbines for the generation of water power, not atomic energy, but water power.

The work is of interest. Dr. Smith, who is the metallurgist on the General Advisory Committee, expressed great interest in it and said that as a job of work it fell within the intent of the General Advisory Committee's recommendations.

The defense establishment seems to be a complex affair, not too unlike our own Navy. Much of the basic work in physics in this country is done by the Navy, and I would see no objection under those conditions to a foreign government sending to a naval contractor equipment for the study, let us say, of cosmic rays. In fact, that goes on.

I realize that the fact that it was a defense establishment, when one knows no more about it than that, raises the thought that it was in violation of the terms of the AEC agreement.

Senator MILLIKIN. Mr. Chairman, may I ask a question?

The CHAIRMAN. Senator Millikin?

Senator MILLIKIN. Assuming, just assuming, that it was for military purposes, in getting up the classifications, was it contemplated that any isotopes should be sent abroad in aid of military purposes?

Dr. OPPENHEIMER. It was not.

Senator HICKENLOOPER. Mr. Chairman.

The CHAIRMAN. Senator Hickenlooper?

Dr. OPPENHEIMER. Let me say another word: It was contemplated that they would be sent abroad only for basic research. No one can tell whether from basic research something of military value will emerge, but this country is an awfully good country to take advantage of those things.

Senator MILLIKIN. Dr. Oppenheimer, basic research does not operate in complete isolation, does it? I mean, if something were turned up in basic research that could be useful for a military purpose, it is reasonable to assume that it would finally evenuate that way, would it not?

Dr. OPPENHEIMER. Yes, but there is a long chain. The shortest chain and the longest and most dramatic—

Senator MILLIKIN. There is a long chain between the chicken salad and the gleam in the eye of the rooster, but they all have relation with each other.

Dr. OPPENHEIMER. You could not be more right, Senator.

[Laughter.]

Senator HICKENLOOPER. Mr. Chairman.

The CHAIRMAN. Senator Hickenlooper?

Senator HICKENLOOPER. I merely want to point out in his statement of understanding as to what use it could be put to, the application for the shipment was that this was to be used to trace the flow of molecules of iron in steel at high temperatures.

Now, as I say, you understand that they are seeking information on turbines or something of that kind?

Dr. OPPENHEIMER. I have seen a dispatch which says that. I do not know whether this information was in the hands of the Commission at the time the shipment was made.

Senator HICKENLOOPER. But it is your understanding that their primary purpose here is searching for information leading to better turbines for the Norwegians?

Dr. OPPENHEIMER. Yes.

Senator HICKENLOOPER. Would you consider the building of turbines and better steel for turbines building for industrial purposes?

Dr. OPPENHEIMER. I would think, looking at Norway, that it was a very important industry for Norway.

Senator HICKENLOOPER. And that, therefore, that information would be for industrial purposes, would it not, industrial information?

Dr. OPPENHEIMER. I see what you are driving at. May I—

Senator HICKENLOOPER. I do not care whether you see it or not. I am asking you a question.

Dr. OPPENHEIMER. This is a basic research whose results will be valuable to industry.

Senator HICKENLOOPER. Yes.

Dr. OPPENHEIMER. But I would like, if I may, to take this controversial piece of the Atomic Energy Act and say a word or two about it. May I do so?

The CHAIRMAN. Yes.

Dr. OPPENHEIMER. The Atomic Energy Act says, and you are the people who drafted it, so you know what it means, that we should not transmit information abroad for industrial purposes until safeguards have been provided.

Now, I know that at the time the act was written you had been exposed to a barrage of testimony from characters like me, and the upshot of this testimony was the following: That you could not have industrial power from atomic energy without danger of great military resources. You maybe could not have it cheaply anyway, but as soon as you set up an atomic energy power program you had an arsenal of atomic bombs. That is what I said and that is what everybody said.

It seems to me that the interpretation which the laity have made of this provision of the act is that if industrial power ever became a reality you wished to be advised of it, and in the meantime let us not help any other country to get industrial power because if we do we will at the same time help it get atomic weapons; I regard this as a very prudent provision. It is certainly not possible to take the definition of "atomic energy" and the prohibition against industry—helping other nations industrially, literally; it is certainly not possible to do that, Mr. Senator, because everything we do in this is contrary to it.

The CHAIRMAN. Everything we do is what?

Dr. OPPENHEIMER. Contrary to it.

The CHAIRMAN. What do you mean by that?

Dr. OPPENHEIMER. Atomic energy is defined—shall I look for it—the definitions must be some place.

Mr. HINSHAW. Page 21 of the act.

Dr. OPPENHEIMER. Thank you. [Reading:]

The term “atomic energy” shall be construed to mean all forms of energy released in the course of or as a result of nuclear fission or nuclear transformation.

That is the definition of “atomic energy,” and the prohibition on export—where will I find that?

Mr. HINSHAW. On page 13.

Mr. DURHAM. You agree with that, do you not, Doctor?

The CHAIRMAN. Is that a good definition?

Dr. OPPENHEIMER. Well, let me take it a little further, and you can judge. [Reading:]

There shall be no exchange of information with other nations with respect to the use of atomic energy for industrial purposes.

Now, coal is atomic energy by this definition; oil is atomic energy by this definition; people are atomic energy by this definition, and surely one must do better than that if one wants to have a sensible export policy.

Senator HICKENLOOPER. But atomic energy is specifically defined in this act. It has a restricted meaning.

Dr. OPPENHEIMER. I just read the definition.

Senator HICKENLOOPER. But people certainly would not be construed as coming under that definition of atomic energy.

Dr. OPPENHEIMER. I would not wish to construe it that way, but you regard the shipment of isotopes for researches, the benefits of which may be the improvement of industry abroad, as precisely a marginal case which does not correspond to the very real dangers of helping a foreign nation to develop an atomic power industry and have in its backyard the makings of large numbers of atomic bombs. That is a real danger.

Senator HICKENLOOPER. Doctor, may I ask you, these isotopes which have been shipped abroad have been made in our own atomic piles, have they not?

Dr. OPPENHEIMER. To the best of my knowledge, yes, sir.

Senator HICKENLOOPER. I believe that it has been reliably testified here before by people who have had charge of it that that is the case. These isotopes, would you say that they are the result of nuclear fission? Would you say that with respect to these isotopes that have been shipped abroad, that come from our piles?

Dr. OPPENHEIMER. The indirect result of nuclear fission, yes.

Senator HICKENLOOPER. Would you say they are the result of nuclear transformation if they come out of our piles?

Dr. OPPENHEIMER. Whether they come out of piles or not, they are the result of nuclear transformation.

Senator HICKENLOOPER. I know you are not a lawyer, and I do not intend to argue the legal point, but those terms are specifically used in defining atomic energy, so that the law says what atomic energy is, and those things that come as a result of nuclear fission, as the result of nuclear transformation, therefore, regardless of what anybody says, are defined by law as being atomic energy.

Dr. OPPENHEIMER. But oil is a result of nuclear transmutation.

**Senator MILLIKIN.** Doctor, the difference is that the Atomic Energy Commission has the responsibility for this particular type of energy and does not have responsibility for oil, nor for irradiated man nor for any of the other things.

**Dr. OPPENHEIMER.** An unirradiated man is just as much, you see—[laughter]—it is, of course, for the Congress to determine what the intent of this provision is. My opinion is that if the determination were made that isotopes should not be shipped abroad, the Congress would be making a profound mistake; that the action would be re-sented, and that it would be unintelligent.

The legal point I will not debate because I am no lawyer, but I do know that this provision in the act has a very real purpose, and that is to prevent the accumulation of plutonium and fissionable uranium in foreign hands, and that is something that we ought to stick to.

**Senator HICKENLOOPER.** But, Doctor, I will call your attention to the fact that Congress has also determined that we will not furnish information to other nations on how to make atomic weapons. There are those in this country, as has been amply demonstrated by public statements at various places, who believe that that is a bad policy, too, and that we should give that information out, so we are not talking about necessarily what you believe the policy should be; we are not talking about what you believe the safeguards should be.

The point at issue here is what the Congress has determined and has decided, and what the policy as written by the act may be.

Now, it is entirely possible that your philosophy of shipping these abroad may be right. I have not raised objection at this moment to the over-all policy as originally set out, but if your policy should be correct, as I interpret it, from a moral standpoint, then I suggest that perhaps the Congress might consider changing the law to clarify it. But I would suggest—

**Dr. OPPENHEIMER.** I may say that the General Advisory Committee does not inquire as a routine thing as to whether proposed action is legal or not, but in this case we were informed that it did not appear to be in conflict with the law. That is not a matter we pass on. We pass only on whether it makes sense.

I am told by someone who is a lawyer that I am supposed to discuss the relation between two provisions. The two provisions are the ones prohibiting the exchange of information with other nations with respect to the use of atomic energy for industrial purposes, and the dissemination of "scientific and technical information relating to atomic energy should be permitted and encouraged so as to provide that free interchange of ideas and criticisms which is essential to scientific progress."

With the very strict interpretation of one, which you believe is the correct one, I will express some bewilderment as to how this Commission is to carry out these two objectives simultaneously.

**Senator HICKENLOOPER.** I think that is a matter for legal interpretation, as I also expected you to discuss the provision on page 9, although that is also a legal interpretation—you will find in parentheses the figure "2" under the term "distribution," an authorization from the Commission to distribute byproduct materials, but also, for your thinking, because it will come up sooner or later, also for your thinking, I will say that in my judgment this applies only to the distribution of byproduct materials within the United States; and I

will call your attention to the fact that farther down in that section it says:

The Commission shall not distribute any byproduct materials to any applicant—and shall recall any distributed materials from any applicant if certain conditions are not made.

I submit that the very important legal question involved there is that it must apply only to domestic distribution because only within the jurisdiction of the United States can we have any authority to recall and compel the return of isotopes.

Foreign nations, we can recall all we want to, but if they do not want to return, we have no power to do so. I think that is very—

Dr. OPPENHEIMER. In the drafting of the act was it explicitly decided by the committee that drafted the act—and most of you are still here—that all export of isotopes should be prohibited? I did not know this.

Senator HICKENLOOPER. I think the record makes it amply clear that the Congress, on passing this act, thought that no information nor aid whatsoever would go abroad until this troublesome problem of weapons and the safeguarding against the use of weapons in warfare had been reliably settled.

Dr. OPPENHEIMER. How then can one understand that you instruct the Commission to permit the dissemination of scientific and technical information relating to atomic energy?

Senator HICKENLOOPER. I think that can be done within the jurisdiction of the United States where we can control and retain control and retain supervision over—

Dr. OPPENHEIMER. Well, you see—

Senator HICKENLOOPER (continuing). That matter.

Dr. OPPENHEIMER (continuing). That goes beyond, so far beyond, any policy ever envisaged by the Manhattan District or the Commission that it would call for very thorough discussion. That means there will be no publication at all in unclassified form. That is going a long way.

Senator MILLIKIN. Doctor, I suggest that there is one overriding imperative in this act that is not technical, that is not legal, that controls every provision of the act, and that is as follows, in the very preamble, where it says:

Accordingly, it is hereby declared to be the policy of the people of the United States that, subject at all times to the paramount objective of assuring the common defense and security—

Dr. OPPENHEIMER. Right.

Senator MILLIKIN. Every consideration that has been mentioned here is subject to that overriding imperative.

Dr. OPPENHEIMER. It is with that in mind that the General Advisory Committee has made its many recommendations.

Senator MILLIKIN. And the doctor has stated that it did not contemplate that these isotopes would be used for military purposes abroad?

Dr. OPPENHEIMER. Pardon me.

Senator MILLIKIN. You have already testified that it was not contemplated in setting up classifications—

Dr. OPPENHEIMER. No.

Senator MILLIKIN (continuing). That isotopes would be sent abroad to aid military developments?

Dr. OPPENHEIMER. Absolutely right.

The CHAIRMAN. And the ones that have been sent abroad are the ones that we have not found it possible to use for our own military establishment?

Dr. OPPENHEIMER. That we have not in fact used for secret work.

The CHAIRMAN. Senator Vandenberg?

Senator VANDENBERG. Well, Dr. Oppenheimer, you are not only an expert in science, in nuclear physics, a field in which you have certainly rendered your country incomparable service, but you are also an expert in connection with the problems that are raised when we were writing this law, between those who wanted civilian control and those who wanted military control.

The civilian control wanted, and I think I ought to immediately say that I am one of those who unequivocally stands for continuing civilian over-all control——

Dr. OPPENHEIMER. You are right.

Senator VANDENBERG (continuing). But, Dr. Oppenheimer, you will recall that we composed that difference by the creation of a Military Liaison Committee which was supposed to be sort of a persistent and relentless watchdog in connection with security matters.

Will you give me your conception of what the responsibility of the Military Liaison Committee is? Perhaps that is too broad a question. Let me narrow it. When the Atomic Energy Commission confronts for the first time a shipment of isotopes abroad to a military establishment, would you not think it was elementary prudence, if not anything else, to ask for an affirmative advice of the Military Liaison Committee before it was done?

Dr. OPPENHEIMER. I am tempted to say "Yes," but to answer a question like that, I would have to——

Senator VANDENBERG. But you do not yield to your temptation.

Dr. OPPENHEIMER (continuing). Know more about the detailed working relations between the Military Liaison Committee and the Commission. My knowledge of these relations is that they are very good, but there is an understanding, as they get to be within any two organizations as to matters in which it is important for the two to consult, and as to matters in which the Military Liaison Committee is willing to waive its scrutiny.

Certainly, the main functions of the Military Liaison Committee are not the negative ones of guarding secrets, and so on, but the main functions are to be sure that the Atomic Energy Commission knows what it needs to do to increase the military strength of this country; what the priorities are, what the importance is, and that the services are prepared to take advantage of every new development and every improvement which takes place in the Commission laboratory.

It is this affirmative, purely military function, which is the principal function of the Military Liaison Committee, and I would think that in the light of the enormous number of problems that arise in this area, that you would have to go directly to the Commission or the Military Liaison Committee to see whether the referral of a specific case of isotope shipments should or should not have been made.

My temptation is to say "Yes" to you because it sounds like common sense.

Senator VANDENBERG. Well, if your overriding interest was not scientific, against which I do not complain, do you not think you would very definitely yield to the temptation to say yes, without reservation?

Dr. OPPENHEIMER. That proposes a hypothetical problem, rather difficult for me to grapple with.

Senator VANDENBERG. I think your answer is entirely satisfactory to me.

Senator MILLIKIN. The Doctor is also an expert in semantics. [Laughter.]

The CHAIRMAN. Are there any further questions?

Senator KNOWLAND. I have a question, Mr. Chairman.

The CHAIRMAN. Senator Knowland?

Senator KNOWLAND. Doctor, the other day we had some testimony before us which was testimony, as I recall it, which went to the point that in the event we had not shipped these isotopes abroad, they could be secured in other ways, and mention was made of the French pile and the British pile.

Leaving aside for the moment the desirability or lack of it in shipping either in the broad field or in the specific military usage, if that is possible, in that field, I would like you to clarify the point as to whether, as a matter of fact, the French pile, keeping to that for the moment, concentrated on that, would have been in a position to have supplied substantial quantities of radioisotopes of this nature?

Dr. OPPENHEIMER. My knowledge of the French pile is meager. I was there at Chatillon in September, and it had not yet been put into operation.

I believe that the answer is the following: It does not have a capacity comparable to the Oak Ridge, or the Harwell piles of the British.

If concentrated on any one specific objective it could probably meet—that is, it could have given the Norwegians several millicuries of iron, but it could not have done that at the same time as it did other things, as we do.

Senator KNOWLAND. Just for the record, Mr. Chairman, I would like to read at this point from the fourth semiannual report of the Atomic Energy Commission, page 10, wherein it relates to wartime development. It says:

But the cost and scarcity of isotopes would long have prevented their use in most laboratories had it not been for the wartime development of the nuclear reactor or atomic pile. These can manufacture radioisotopes in hitherto undreamed of quantities. For example, the Oak Ridge pile in a period of a few weeks has produced more than 200 millicuries of carbon 14, millions of times more than the amounts previously available. The operating cost was about \$10,000. Theoretically it would take 1,000 cyclotrons to equal this output, and the operating cost would be well over \$100,000,000.

I merely wish to ask this additional question: As I understood, you said that so far as you know, Norway, in this specific instance, or any other country, was not using radioisotopes for secret military purposes.

I would like to ask whether in the over-all picture of national defense and the defense of a country and its ability to either defend itself or if engaged in war to conduct a successful war, if defense in its broader term does not mean more than merely secret military development? It means the adequate hydroelectric resources, perhaps; it means adequate industrial resources; it means new types of weapons, to be sure, and new types of metals that go into weapons.

Now, in that broader—

Senator HICKENLOOPER. I suggest for the record—this is very important—that the reporter is not able to get the assenting nods of Dr. Oppenheimer's head. I merely suggest for the sake of the record that we get a verbal "yes," if we can, to these various categories of the question.

Dr. OPPENHEIMER. The nods indicate that I understand.

Senator HICKENLOOPER. But the nods—I see. [Laughter.]

Senator KNOWLAND. I will try to specify and give the doctor a chance to go over it.

Is it not true, Doctor, that the over-all national defense of a country rests on more than secret military development alone?

Dr. OPPENHEIMER. Of course it does, and in the case of this country, whose military strength is the prime military factor in the world today, it is far more true than in any other.

My own rating of the importance of isotopes in this broad sense is that they are far less important than electronic devices, but far more important than, let us say, vitamins, somewhere in between.

[Laughter.]

Senator KNOWLAND. Now, taking the question that was raised in the application by Norway—and again I want to reiterate that no one on this committee complains of Norway, because she is a fine country, has an able record for freedom; she is a North Atlantic Pact nation, and there is nothing meant in criticism there—but assume for the moment that any country, by the use of research with radioisotopes, could discover a better way of making steel that would stand high temperatures, which ultimately, as Senator Millikin points out, could be translated into the building of a better type of jet engine. Would not that knowledge be of tremendous value in the military defense of any nation?

Dr. OPPENHEIMER. From what I know of the situation, such a discovery would be of very slight use to the Norwegians; of enormous use to us, and of intermediate use to the British, because the ability to use basic information is largely a question of the vigor of your technology.

History again and again shows that we have no monopoly on ideas, but we do better with them than most other countries.

Senator KNOWLAND. All I am trying to develop, Doctor, at this point is, assume for the moment that a country with a substantial industrial background far brighter than Norway—let us take Russia as an example—if she were able to discover a better way of producing steel that could withstand high temperatures, would that be of value to her in her over-all national defense, in your judgment?

Dr. OPPENHEIMER. I think it was obvious that it would be of some value, but my understanding of the situation in Russia is that even when the basic facts are known, they have, and I think we have cause to be grateful, some difficulty in making practical application of them.

The CHAIRMAN. Mr. Holifield?

Mr. HOLIFIELD. Dr. Oppenheimer, the General Advisory Committee is composed of nine members appointed by the President, I believe?

Dr. OPPENHEIMER. That is correct, sir.

Mr. HOLIFIELD. At this time, Mr. Chairman, I would like to have these nine members' names put into the record, and then I will pursue the question.

(The General Advisory Committee referred to consists of the following members:)

Dr. J. Robert Oppenheimer, director, Institute for Advanced Study, Princeton, N. J., Chairman.

Dr. James B. Conant, president, Harvard University, Cambridge, Mass.

Dr. Lee A. DuBridge, president, California Institute of Technology, Pasadena, Calif.

Dr. Enrico Fermi, professor of physics, Institute for Nuclear Studies, University of Chicago, Chicago, Ill.

Dr. I. I. Rabi, chairman, department of physics, Columbia University, New York, N. Y.

Hartley Rowe, vice president and chief engineer, United Fruit Co., Boston, Mass.

Dr. Glenn T. Seaborg, professor of chemistry, University of California, Berkeley, Calif.

Dr. Cyril S. Smith, director, Institute for the Study of Metals, University of Chicago, Chicago, Ill.

Oliver E. Buckley, president, Bell Telephone Co., New York, N. Y.

The CHAIRMAN. I do not know what the subject of Mr. Holifield's question is, so let me put this question to you, Doctor:

Senator Knowland said if the information could be developed that would be helpful to the making of jet engines, whether that would become of value to a greater country like Russia. Now, under the terms of these shipments, the Norwegians are honor-bound to make the knowledge that they secure available to everybody which, of course, includes us?

Dr. OPPENHEIMER. Yes.

The CHAIRMAN. So that if they do get something of value, presumably we would know it as quickly as anybody.

Dr. OPPENHEIMER. That is exactly the point, and be in a far better position in 999 cases out of a thousand, to make real use of it.

The CHAIRMAN. Mr. Holifield?

Mr. HOLIFIELD. Dr. Oppenheimer, I wanted to ask you to what extent has the Atomic Energy Commission availed itself of the services of the General Advisory Committee?

Dr. OPPENHEIMER. Rather completely. We meet 2 or 3 days every 2 months or so. We get a good many communications from the Commission in between.

I would say that there were few, if any, cases where we wished the Commission had asked our advice, and they did not. In many fields we have a very great sense of responsibility because, whether the Commission would have followed the policies it has or not otherwise, I do not know, but its policies coincide with the recommendations of this committee.

Mr. HOLIFIELD. The Atomic Energy Commission has followed the recommendations which the General Advisory Committee has given them?

Dr. OPPENHEIMER. Yes.

Mr. HOLIFIELD. Your General Advisory Committee is, of course, completely independent of the Commission. Its members are appointed for varying terms of years by the President?

Dr. OPPENHEIMER. That is right, and they do not see eye to eye on many questions, so that we have a bit of breadth and debate.

Mr. HOLIFIELD. I see.

Now, have there been any important recommendations which your General Advisory Committee has made which the Commission has been diametrically opposed to?

Dr. OPPENHEIMER. I testified on this, I think, 2 months ago, and I think I testified "No," and I think the committee agreed with me.

We have often contradicted ourselves, but fortunately the time lag between the adoption of a recommendation and actual action is long enough so that these contradictions in what we have said have not been serious.

Mr. HOLIFIELD. In the evaluation of the work of the Atomic Energy Commission, has your General Advisory Committee considered that they have made progress and substantial accomplishment?

Dr. OPPENHEIMER. It is, of course, not our statutory job to evaluate the Atomic Energy Commission.

However, we met about a week ago, and we knew that the Commission was under criticism, and we felt that it was likely that one or another member of the committee would be called on to testify, and a statement was drafted at that time, which constitutes a kind of evaluation, and it was drafted with the idea that it could be presented by any member of the committee who was asked the question you just asked.

I would be glad to read it or have it read into the record. It is not very long, and it is a statement which was drafted by two members of the committee, but unanimously concurred in by every member of the committee, not only as a statement of what they believed, but as a statement that we would like to make to you.

May I read it?

Mr. HOLIFIELD. Proceed, please.

Dr. OPPENHEIMER. The General Advisory Committee, in accordance with its statutory obligations, has followed the scientific and technical activities of the Atomic Energy Commission with considerable care since January 1947. We have seen at first hand the grave difficulties which the Commission faced in assuming responsibility for an extremely complex enterprise which had been disrupted by the ending of the war and by a year of uncertainty pending the establishment of the Atomic Energy Commission.

When the Commission took over, the future of the whole enterprise was uncertain, the continuity of production of fissionable materials was far from assured, the design and development of improved weapons was nearly stagnant. In each of these respects, the picture has radically changed. Better weapons have been developed and tested, the production of materials has been substantially increased and assured, and a sound and forward-looking program has been established.

There have been occasions on which the Advisory Committee has criticized the Commission and offered suggestions for the improvement of its program, which suggestions have largely been followed. In all of our examinations of the Commission's activities we have seen a frank recognition of the problems of management inherent in any new undertaking and a steady progress in their solution. The improvement which has been achieved during the Commission's administration appears to us to offer clear proof of competence and devotion to duty by the Commission.

I make this statement available to you for your records.

Senator VANDENBERG. May I ask a question at that point?

Dr. Oppenheimer, is that presumed to include an evaluation of security and the problems related to it?

Dr. OPPENHEIMER. It says that it is based on our knowledge of the scientific and technical aspects of the work.

Senator VANDENBERG. That is what I understood.

Dr. OPPENHEIMER. Some parts of security are scientific and technical; for instance, declassification, the sending of isotopes abroad; these aspects are included. Personnel security is something that we have no first-hand knowledge of. Guarding is something that we have no first-hand knowledge of, and any statement that we make refers, (A) to the things that we see at first-hand and, (B) to the over-all impression we get by knowing the projects. They cannot be a specific indorsement of the nonscientific and nontechnical things.

The sense of this statement is that if a management were bad the progress could not have been good.

Senator VANDENBERG. But your committee pays little or no attention to the problem of security, as such; your discussions are essentially in the field of science.

Dr. OPPENHEIMER. We talk about declassification policy; we talk about things touching security, but personnel security, guarding, these are matters which we have either not touched at all or very, very little.

Senator VANDENBERG. Thank you.

The CHAIRMAN. In other words, your concern is directed primarily to security by achievement rather than security by concealment.

Dr. OPPENHEIMER. We also have to worry about security by concealment, but the sense of what we wanted to say was that the job was in good shape as a positive job, and that this showed that there was pretty good management.

Mr. HOLIFIELD. On those points, where scientific secrecy is necessary, such as the declassification of documents and the shipment of isotopes and such other related matters as do come under your scrutiny, are you in a position to say that the Atomic Energy Commission has followed your advice?

Dr. OPPENHEIMER. It has been a little bit more conservative than we would have been, but otherwise it has followed our advice.

Mr. HOLIFIELD. If they have erred, they have erred on the conservative side rather than going beyond your—

Dr. OPPENHEIMER. I am not sure we are right, but comparing the recommendations of the committee with the actions of the Commission, their actions have always lain within our recommendations.

Mr. HOLIFIELD. Now, many of the members of this committee, I am sure, feel that we owe a duty to the American people to carry to them an over-all true evaluation of this program.

In your opinion, is it necessary to reveal secret data or secret methods or secret projects in order to get that evaluation over to the people?

Dr. OPPENHEIMER. Let me answer that by an analogy. I was once a member of a group of which Mr. Lilienthal was chairman, which wrote a report on the international control of atomic energy.

In the preface to that we said that we had had access to a great deal of secret information which could not be revealed, and that this information had been important to us in arriving at our conclusions.

Nevertheless, we thought that the conclusions could stand without revealing the secret information.

I think a similar situation obtains here.

Mr. HOLIFIELD. In other words, conclusions as to the——

Dr. OPPENHEIMER. And evidence, too.

Mr. HOLIFIELD. And accomplishment of the atomic energy program can be made available on substantially authoritative grounds to the American people without resorting to secret information in order to either support it or detract from it?

Dr. OPPENHEIMER. I believe that there is enough in the public domain or that could and should be in the public domain to make an inquiry sound.

I think there is a lot that is not in the public domain, and that will limit the exhaustiveness of any public inquiry.

Mr. HOLIFIELD. Thank you, Doctor.

The CHAIRMAN. Mr. Cole?

Mr. COLE. Doctor, what was the recommendation of the General Advisory Committee with respect to the Commission's granting of scholarships, fellowships, to avowed Communists?

Dr. OPPENHEIMER. We made no recommendation.

Mr. COLE. Was the proposal of the commission with respect to fellowships submitted to the General Advisory Committee?

Dr. OPPENHEIMER. The initial proposal long ago?

Mr. COLE. Yes.

Dr. OPPENHEIMER. It was, and we commented on it favorably. That is all in your records.

Mr. COLE. What is your own opinion with respect to granting fellowships to avowed Communists?

Dr. OPPENHEIMER. I stated that—well, I stated my general opinions in a letter to the chairman, which was read into the record. I think if the problem were as straightforward as picking among two equally qualified people, one who is an avowed Communist and one who is not, it would be a very easy problem.

The problem is, how much trouble you take to find out whether a man is a Communist, and what do you do in the course of this, and there I have rather strong views, that a fellowship program which brings with it the investigative machinery that we use for secret things had better be dropped. It will do more harm than good.

Mr. COLE. You feel that the withholding of fellowships to avowed Communists is an invasion of academic freedom?

Dr. OPPENHEIMER. No.

Mr. COLE. Going back to isotopes, I would like to have your interpretation of the recommendation of the General Advisory Committee which is quoted to us as being as follows:

The conditions under which these materials will be sold at cost to an individual scientific laboratory are such as to insure that the sole purpose for which they will be used is for research or medical treatment.

Now, is it your opinion that that research to which reference is made in the recommendation is only research related to or in connection with medical treatment?

Dr. OPPENHEIMER. That was not our intention. In other places we said, "basic research."

Mr. COLE. Well, that partially answers my next question. What kind of research was intended when we used that expression?

Dr. OPPENHEIMER. Research directed at the discovery of the nature of the world of nature and man, and not research directed at the solu-

tion of a practical problem. There is no hard line, but there is such a great difference between development and engineering on the one side, and science on the other, that I think it is a pretty clear-cut thing.

Mr. COLE. Then, it is the recommendation of the committee that isotopes may be shipped for basic research even though that research—

Dr. OPPENHEIMER. That was our belief.

Mr. COLE. May have some relationship to eventual practical use?

Dr. OPPENHEIMER. Well, there is, I believe, no research in the world, of which anyone can guarantee that it will never have any relationship to eventual practical use.

It is awfully easy to tell in specific cases whether a man is busy developing a gadget and wants to improve a piece of it, or whether a man is curious about how things work, and is pursuing that curiosity.

There are borderline cases, and no words will ever cut that border absolutely clean.

Mr. COLE. That prompts me to make my final inquiry and to ask my final question: I am wondering how difficult it would be for the General Advisory Committee to enumerate the particular isotopes for which shipment abroad the committee recommends, or is the field of isotopes so completely variable and innumerable that it would be impossible to identify them and to list them?

Dr. OPPENHEIMER. I think that even the General Advisory Committee would assume a rather conservative use. You would not ship isotopes if you saw any danger, and you would not ship any isotopes unless you had a pretty good feeling they would be useful.

I believe we could extend the Commission's list. I know of no way in which we need to cut it back, but this is an undertaking which one member of the General Advisory Committee, Dr. Seaborg, who is one of the authors of this [indicating a pamphlet]—this is what is known about isotopes—could perhaps do better than the committee, as a whole. A committee is a bad agency to do any really useful work, as you know. [Laughter.]

Mr. COLE. The trouble with your statement that the committee is satisfied with permitting the shipment of isotopes except those which might have a dangerous use is that when you have to rely upon somebody's determination of what is dangerous and what is not dangerous.

Dr. OPPENHEIMER. Sure.

Mr. COLE. What I am wondering is if it is not possible for the General Advisory Committee to enumerate the isotopes which, in the opinion of the General Advisory Committee, are not dangerous.

Dr. OPPENHEIMER. I believe we could do that. My impression is that Dr. Pitzer, who is Director of Research, and Dr. Aebersold, who is in charge of the isotopes program, are probably better persons to do it than the General Advisory Committee. They are our colleagues who are scientists, and they have been living with these things for years.

I believe you would not get as good a job out of the General Advisory Committee, but there is no reason in principle why we should not take a day off and do it.

Mr. COLE. I should like to emphasize or make certain that I understand your statement. There have been no instances in which the

Commission has failed to observe the recommendations of the General Advisory Committee?

Dr. OPPENHEIMER. That is too broad a statement. I think I need to qualify it by saying that there are none sufficiently prominent so that any member of the General Advisory Committee remember it in the field that we are supposed to advise on.

Mr. COLE. Thank you.

The CHAIRMAN. Mr. Hinshaw?

Mr. HINSHAW. Mr. Chairman, before asking two or three questions of Dr. Oppenheimer, I should like to acknowledge, as I am sure the committee does, that the law, as agreed to and as enacted, is probably, and I might say no doubt is, an imperfect instrument in many, many respects, but assuming that the law is a law, the questions I would like to ask are as follows:

First, are radioactive isotopes included within the definition of atomic energy as contained in the act in section 18 (a), in your opinion?

Dr. OPPENHEIMER. The law was written by other people, and I do not know the answer to that question.

Mr. HINSHAW. Well, the law is in section 18 (a), and I thought, perhaps, having read it that you might be able to——

Dr. OPPENHEIMER. Let me say, if I take those words strictly, I include every source of energy except tidal power. If you say that does not make common sense, then I have got to ask you what is common sense?

Oil is made as a result of the absorption of sunlight which is generated by the reaction of nuclei in the sun. If you want me to take the law strictly, you have got a very broad kind of definition. If you want to define atomic energy in a practical way, I will understand your definition, but do not ask me to make it.

Mr. HINSHAW. Mr. Chairman, I would assume that the committee in drafting the act, and I was not a member of the committee at that time, called upon competent scientific personnel in the drafting of section 18 (a). I do not know whether Dr. Oppenheimer was one of those who was called upon to help draft that section or not.

Dr. OPPENHEIMER. I was not.

Mr. HINSHAW. But in all events, would your answer to the question in its strictest sense then include the radioactive isotope as coming under and within the definition as contained in section 18 (a)?

Dr. OPPENHEIMER. If I were to define atomic energy for the purposes of this act, I would exclude radioactive isotopes from the definition.

Mr. HINSHAW. Well, I acknowledge that we, perhaps, should amend the act accordingly, but I just asked a question.

Dr. OPPENHEIMER. I would also exclude oil and human beings and coal.

Mr. HINSHAW. Section 18 (a)——

The CHAIRMAN. Everything?

Dr. OPPENHEIMER. Well, tidal power, you may be able to get by.

The CHAIRMAN. Tidal power?

Dr. OPPENHEIMER. Yes, I am not sure.

The CHAIRMAN. The movement of the ocean?

Dr. OPPENHEIMER. Of the tides; yes, sir. It is not known whether that results from nuclear transmutation.

The CHAIRMAN. Is that the only exception?

Dr. OPPENHEIMER. It is the only exception I know of.

Mr. HINSHAW. Section 18 (a), if I may be privileged to read it again, is very short, and reads as follows:

The term "atomic energy" shall be construed to mean all forms of energy released in the course of or as a result of nuclear fission or nuclear transformation.

Now, that term applies directly to energy and does not apply to matter, as such, as I understand it, and its energy relations; therefore, under the terms of that definition, would radioactive isotopes constitute a form of energy released in the course of or as a result of nuclear fission or nuclear transformation?

Dr. OPPENHEIMER. An isotope is not energy. It is a source of energy, just as oil is not energy but a source of energy. I am not a lawyer, and the advice I give the committee on these matters will be of no use. I do not mind chatting with you about them, but I advise you against taking my remarks seriously. [Laughter.]

Mr. HINSHAW. Well, I am sure the committee always takes the doctor's remarks seriously, as he is considered to be one of the outstanding authorities on the subject.

My second question follows by virtue of the fact that under the Commission's Fourth Semiannual Report, there begins on page 14 a long dissertation under the general heading "Distribution of isotopes."

On page 28 there begins a section on industrial utilization which runs for two pages in the Fourth Semiannual Report.

Now, the question is, does the shipment of radioactive isotopes to a foreign military establishment constitute in your judgment a transmission of information with respect to the use of atomic energy for industrial purposes?

Dr. OPPENHEIMER. I have already testified that in my opinion the intent of the law should have been different than to exclude these, but what the intent of the law is you cannot get by asking me.

Mr. HINSHAW. Mr. Chairman, I submit that it is very difficult indeed to find out what the law means when we would like very much to know.

Dr. OPPENHEIMER. I think the law needs to provide that we should not encourage or help development in foreign countries which will lead to the accumulation of large numbers of atomic weapons. That is a big point. Let us keep our eyes on that ball.

The CHAIRMAN. And that the intent of the act in that respect as far as you know has not been violated, has it, Doctor?

Dr. OPPENHEIMER. It certainly has not.

Mr. DURHAM. Well, there is a possibility, Doctor, that we may be struggling with this problem beyond this element; we may be struggling with it in all of the elements, a good part of it.

Dr. OPPENHEIMER. I regard the isotope problem which I have talked about this morning as really very slightly affecting security, and for that reason it is one of the few areas in which we are free to act the way we would like to act, generously, imaginatively and decently; in the things that involve security we are inhibited from doing that and, our friends abroad understand that.

Mr. HINSHAW. Mr. Chairman, in conclusion, I submit that perhaps the law should be amended, but that it is very difficult in the meantime to find out what a proper interpretation of the law is in respect to the subject of the shipment of isotopes for industrial purposes.

The CHAIRMAN. Mr. Jackson?

Mr. JACKSON. Mr. Chairman, I would like to ask a couple of questions, I think, which may be slightly repetitious and with respect to which there may be a slight reiteration, but I want to get to the heart of this problem.

The committee has been discussing isotopes in public hearings.

I think the American public would like to know whether the conduct of the Commission in connection with the dissemination of isotopes abroad, as related in the hearings this morning, jeopardize the security of this country.

Dr. OPPENHEIMER. I believe that it was in the interest of the security of this country, and I will spell that out. I believe that for a country of the size and wealth of Norway, to establish its own atomic energy program is both a discouraging process and a temptation. I believe that if we took an absolutely rigid attitude with regard to noncooperation in places where security was not involved, we would be encouraging all agencies abroad to make themselves totally independent of us.

They would have trouble doing that, but it certainly would not be in the interest of the security of the United States for us to follow that line.

Mr. JACKSON. I am glad, Dr. Oppenheimer, that you mentioned the place of Norway because it has played a rather prominent role in the discussion of the exportation of isotopes.

You feel, then, that the exchange of information, of technical information, that may come from the export of isotopes to Norway, may ultimately benefit the United States?

Dr. OPPENHEIMER. Oh, I have no doubt of it.

Mr. JACKSON. You have no doubt of it.

Do you know of the scientific personnel in Norway? Do you know something about them?

Dr. OPPENHEIMER. I know some. A number of Norwegian mathematicians and physicists have visited the Institute in Princeton. They are excellent workers. I do not know the people involved in this iron 59 job.

Mr. JACKSON. Getting away from legal semantics, Dr. Oppenheimer, and to again get to the heart of the Atomic Energy Act, do you feel that possibly the real purpose of the restrictive provisions of the act, dealing with exportation of certain matters, were for the purpose, the overriding purpose of protecting the secret of the bomb and to prevent a potential enemy or other countries, other foreign countries, from getting information that would result in the accumulation or the development of atomic bombs?

Dr. OPPENHEIMER. That is just about it. I do not see why the United States should take actions whose effect will be to stimulate atomic energy for military purposes abroad.

Mr. JACKSON. Dr. Oppenheimer, I am sure there is not any man living who can possibly assure the people of this country from a technical standpoint like you could at this time. In connection with this isotopic problem, as far as exportation is concerned, can you assure the people of this country that we are not jeopardizing our security in the way the program has been handled up to this time?

Dr. OPPENHEIMER. I certainly can.

Mr. JACKSON. And, Dr. Oppenheimer, some mention was made of the fact that in connection with the isotopic research, that it might result in certain improvements in materials that could be used for war purposes. Is it not true that we are engaged in the United States in open research that is available to other countries, that likewise could be used for—

Dr. OPPENHEIMER. Of course.

Mr. JACKSON (continuing). Military purposes?

Dr. OPPENHEIMER. There are three open users of iron 59 for studying the diffusion of iron in alloys. All of this work will be published.

Mr. JACKSON. And that situation is comparable to the isotopic problem we are discussing here?

Dr. OPPENHEIMER. It is that. It is the same isotope as in Norway.

Mr. JACKSON. Dr. Oppenheimer, you were the wartime Director of the Los Alamos Laboratory?

Dr. OPPENHEIMER. Yes; I was.

Mr. JACKSON. I wonder if you would care to comment on the present caliber of the laboratory at Los Alamos as compared with the situation that you had to face possibly under the Manhattan project? What improvements, if any, have been made, and what progress has been made?

Dr. OPPENHEIMER. I will not testify against myself. During the war we had the best laboratory in the world there. But I think that it is generally regarded by my colleagues that Los Alamos is the best Federal laboratory and the best laboratory working on a military job that there is in the country. And I feel, with all the confidence in the world, that it is a very good laboratory. Its morale is good; its product is good; it has learned a number of things; and it has the courage to try out a number of new things and it is air-borne.

This being air-borne is the result of many things, but it is very largely a result of the understanding, the encouragement, the babying if you want, that the Commission has given it. The laboratory could have gone to pieces. It has not. Its director is a fine fellow.

Mr. JACKSON. I know that you did a fine job in the laboratory during the war. We have been throwing words around here so much this morning that possibly my intent was not clear.

But what I want to get from you is whether or not you could say that we were making real progress at Los Alamos, and are you satisfied with the progress, if any, that has occurred since the Atomic Energy Commission has taken over?

Dr. OPPENHEIMER. I am very much satisfied. Quite a number of very important improvements in atomic weapon design and atomic weapon manufacture have been worked out. The present program of the laboratory is to carry this further and to get into some new and more difficult things.

It is a sound program; it is soundly conceived; and it is going forward full steam ahead. It is not a wartime effort. It is not the kind of 100 percent, everybody-in thing that we had in the war; but we would not expect that. And it is a very, very good laboratory.

Mr. JACKSON. Considering all the factors, then, that exist today, you feel that every reasonable and prudent effort is being made to protect the security of our country?

Dr. OPPENHEIMER. Every possible effort.

Mr. JACKSON. One or two other matters, Dr. Oppenheimer. Mr. Lilienthal has testified from time to time in connection with security problems that security involves more than guards, fences, and personnel clearances.

I wonder if you would care to comment, if you might—if you feel free to do so—on the security program very briefly of the Commission.

Dr. OPPENHEIMER. I think the Commission has had a very, very difficult time reconciling the provisions of the act and the needs for reliability on the part of its personnel with the kind of freedom and spontaneity which is required if real progress is to be made.

My feeling is that the Commission has sweated blood over that one and come up with about as good an answer as it is possible to get. I do not think anybody can be happy at the fine-tooth combing that has to be given to every man that has to work on the atomic energy program. But one understands why it is; and as long as it is restricted to those places where there are some secrets to be kept, people will stand for it.

I think the Commission has balanced very carefully, in the few cases I know about, the requirements of security and the requirements of progress and of humanity. It has not been easy.

Mr. JACKSON. Considering the problem of a secrecy, in the first instance, being foreign to our democratic way of life, and the conflicts that arise in the field of science: Do you feel that they have struck a balance that, as its ultimate result, will provide for real security for our country?

Dr. OPPENHEIMER. I think they can go further toward making information public which is now secret. But I think that since that is an irreversible step, they have been very prudent and very good in handling it. I do not think they have gone far enough.

Mr. JACKSON. Has the General Advisory Committee made a statement in connection with the shipment of isotopes?

Dr. OPPENHEIMER. Oh, yes. Your records are full of statements.

Mr. JACKSON. I mean recently?

Dr. OPPENHEIMER. Recently it simply said that it agreed with itself.

Mr. JACKSON. Including the Norwegian shipment?

Dr. OPPENHEIMER. It did not say anything about Norway, largely because the detailed evidence of what that case was, was not available to us. But the most qualified member of our committee, the metallurgist, expressed the opinion that it did fall within the intent of the Commission's work.

Mr. JACKSON. One last question, Dr. Oppenheimer. Considering the knowledge and information that you have of the over-all program of the Commission, and bearing in mind the work that you have done in connection with the Manhattan project, are you satisfied as a whole with the program of the Atomic Energy Commission and with its management?

Dr. OPPENHEIMER. I certainly am. As a member of the General Advisory Committee, it is my job not to be satisfied. Here it is my duty, and my pleasure, to be satisfied.

Mr. HOLIFIELD. Will the gentleman yield?

Mr. JACKSON. Yes.

Mr. HOLIFIELD. Dr. Oppenheimer, in regard to the shipment to Norway of these isotopes, is it not true that the atomic energy project and

the scientists of this country owe a great deal to a Norwegian scientist by the name of Neils Bohr and some of his associates?

Mr. JACKSON. He is Danish.

Mr. HOLIFIELD. My Norwegian colleague is very zealous.

Dr. OPPENHEIMER. Even the disputes to which this committee has been host are trivial compared to those as to the relative merits of the Danes and the Norwegians. If I could keep out of those, I would appreciate it.

Mr. HOLIFIELD. I will grant you to keep out of them. But there is a well-developed scientific group in Norway.

Dr. OPPENHEIMER. That is quite true. Hillaraes was one of their most well-known people at the Princeton Institute last year.

Mr. HOLIFIELD. They cooperated with this country freely and frankly without reservation as far as you know?

Dr. OPPENHEIMER. As far as I know; yes, sir.

Mr. HOLIFIELD. Thank you.

Senator KNOWLAND. Mr. Chairman, I have a few questions to pick up matters in relation to the committee other than the scientific end—leaving aside security—which you have already made abundantly clear.

What I would like to ask, being familiar with the law as to its drafting, of course as you gain experience under a law, regardless of what it is, you perhaps can find ways of improving it, has the Commission, for instance, ever considered in the set-up of the Commission and the General Manager, where the General Manager is appointed by the President directly and confirmed, rather than being directly responsible to the Commission which might otherwise appoint him and hold him responsible to them—has the General Advisory Committee given any thought from an organization chart point of view where the existing law might be improved?

Dr. OPPENHEIMER. On this point we have certainly not. Occasionally, when you follow a technical point, you ask the question: Why are things not going better? And sometimes this refers to organization. This is usually organization on a lower level, and the question you have raised is not one that we have discussed.

Senator KNOWLAND. It has not come up before?

Dr. OPPENHEIMER. My impression is that the individual members of the General Advisory Committee have very different views—separately different views—on how the Atomic Energy Act should have been written.

Senator KNOWLAND. Secondly I should like to ask: You are familiar with the testimony before the committee regarding the loss of some material at Argonne, which they believe they have found substantially all of, perhaps with the exception of 4 grams, I believe.

Could you, from your expert knowledge, tell the committee—assuming just for the moment that the 4 grams did get into hands where they should not be—how valuable the loss of that amount of material, or the gain of that amount of material, might be to a country that was embarking on a program that you were working with a few years ago?

Dr. OPPENHEIMER. It doesn't seem to me decisive. But in order to judge it, I need to know what country had it. At Los Alamos we were very glad to get the first samples of material. But that was because

our mission was to interpose no day's delay between the arrival of the material and the readiness of the bomb.

If we had had another month or so, I don't think we would have been affected. That is the thing which makes these even small samples valuable, a very tight—tight by weeks and months—time schedule. I do not think it would affect the time schedule by any appreciable time, whether we did or did not have it.

Also, 4 grams is not a precisely critical amount; and my understanding is that it was not even isotopically pure. The general feeling I have is that even if the evidence before us is misleading, and material had been abstracted, it would not be something to ring the bell about.

Senator KNOWLAND. My recollection is that the report of the Canadian Royal Commission has amply shown, I believe, that two milligrams was the amount which had been—

Dr. OPPENHEIMER. You see, that is, on the one hand, material which does not exist in nature and which is pretty hard to make by cyclotron bombardment. On the other hand, it was 4 years ago.

Finally, the point there was not how valuable this would be to the enemy, but what a terrible thing it was that it had been given to them.

Senator KNOWLAND. There are both phases of it.

Dr. OPPENHEIMER. We were certainly, at Los Alamos, very glad to get our first plutonium. Uranium-235 was never such a thing. Plutonium was a new substance. We had the feeling—perhaps wrong—that 100,000 lives, maybe more, might depend on whether this thing was ready August 1, September 1, October 1.

Senator KNOWLAND. In other words, as I understand your testimony, it would be of value but not decisive.

Dr. OPPENHEIMER. That is right.

The CHAIRMAN. Senator Hickenlooper?

Senator HICKENLOOPER. Dr. Oppenheimer, the production of weapons and the application of materials, for instance, at Los Alamos is not done by the Commission, is it? It is done by a contractor—the University of California?

Dr. OPPENHEIMER. It is also not done by the contractor. It is done by some fellows. The contractor during the war years was an extremely helpful and able contractor, but was really distinguished primarily by his absence. Since then the university has been allowed to take a somewhat more active part.

But the Commission is dealing with technical people who are paid and protected by the University of California, but who are not normal employees of the University of California, who are not doing a normal thing for the University of California to be doing.

And the policies under which the laboratory is run, the technical directives for the laboratory, the employment policies, the conditions of work, are not determined by the contractor. They are determined by the Commission.

Senator HICKENLOOPER. You mean to say that the University of California does not have a contractual responsibility for the completion of those activities out there?

Dr. OPPENHEIMER. I do not know. During the war the University of California never saw the directives and had no idea what the directives said.

Senator HICKENLOOPER. We are talking about now.

Dr. OPPENHEIMER. I do not know the answer to that question. But my guess is that the directives are agreed to by the laboratory staff and the Commission, that they are written out, and that the role of the contractor is very minor.

Senator HICKENLOOPER. And that the laboratory staff is paid by the University of California. Is that correct?

Dr. OPPENHEIMER. It is paid through the university.

Senator HICKENLOOPER. Reimbursed by the Commission.

I again want to clarify the issue that at least I raised the other day. The issues are not any criticism of the country of Norway, in any way, shape, or form. I did not raise the issue of any criticism of the general isotope programs announced. I state no position either for or against the general isotope program.

The criticism I raised was the opening wedge, as I believe it, of the furnishing of isotopes to a foreign power over whom we have no ultimate control. We may have argumentative influences on our side, but once the isotope is gone, we have no legal control over it; we have nothing but the so-called good faith to go on in any of these countries, after the isotope gets out of our hands.

The criticism was raised that this could be the opening wedge in a policy for the furnishing of isotopes which could supply information which would operate in war potential, whether it is atomic bomb making or high-speed steel or high heat-resistant steel for jets, or any other thing which could be used in war.

Now, that was the sole issue that I raised, and I still do not raise objection or agreement to the general program of isotope distribution for humanitarian purposes.

Dr. OPPENHEIMER. You merely say it is illegal.

Senator HICKENLOOPER. No. I say it is more than illegal. I take the position that when we furnish isotopes that are the tools for the discovery of new laws or new uses or new applications of things such as steel in a military institute, or other things, that we are embarking on a program which I believe is outside the purview of the law, and which is inimical to our national defense because of the lack of control we have over the use of those things.

The CHAIRMAN. May I interject a question?

Senator HICKENLOOPER. Surely.

The CHAIRMAN. Assuming your state of mind to be as you have related it here, would it be possible to serve the proposition of the dissemination of these radioisotopes for medical and biological research abroad, as you have indicated that you would like to do, without coming within the prohibition of the law as you understand it?

Senator HICKENLOOPER. I have repeatedly said that I am neither approving or opposing, at this time, the question of the over-all isotope policy. I may reach that point at a later date when our definitions are better.

But I do not care to get into that particular phase because it is getting afield from the specific thing that I wanted to raise.

May I ask you, Dr. Oppenheimer: Do you know Dr. Shoupp, head of the nucleonics department of Westinghouse Laboratory?

Dr. OPPENHEIMER. I know him, but he is not a close friend of mine.

Senator HICKENLOOPER. It was reported here—I have not seen the clipping myself—that he a few days ago, or in the immediate past, stated in effect—the statement is in the hearings of June 9—

Dr. OPPENHEIMER. I have seen the statement.

Senator HICKENLOOPER. That isotopes are helpful and are being used for heat-resistant steel at high-temperature investigations and for gas turbines, jet engines; and I believe it has come out that isotopes are valuable in research in biology; and I believe it has been stated that isotopes can be used in connection with the mutations of bacteriological forms in that study.

Dr. OPPENHEIMER. I was unable to make head or tail of that statement. I may be wrong, but I was told that there is not a single case where exportable isotopes are being used for military secret research.

Senator HICKENLOOPER. How would you know?

Dr. OPPENHEIMER. From the records of the Commission.

Senator HICKENLOOPER. How would the Commission know, except from the statements that are being made by the users?

Dr. OPPENHEIMER. I am not talking about abroad. I am talking about America. And Dr. Shoupp notwithstanding, Westinghouse proposes to publish the results of its research. This is "scuttlebutt" and should not be in testimony; but I am told that Dr. Shoupp regrets the misinterpretation of what he said.

Senator HICKENLOOPER. I do not know about that.

Dr. OPPENHEIMER. I do not know either. It is hearsay.

Senator HICKENLOOPER. We do not export all of the isotopes that we produce, do we?

Dr. OPPENHEIMER. No.

Senator HICKENLOOPER. Why don't we?

Dr. OPPENHEIMER. The reason we do not export plutonium is that its properties are of interest in the manufacture of atomic weapons.

Senator HICKENLOOPER. It furnishes information?

Dr. OPPENHEIMER. It furnishes information about a highly secret undertaking. If we will take the isotopes separately, I may be able to give you the answer; I may not. I do not know the reason why certain ones are not exported.

Some radioactive isotopes have been used at Los Alamos, but both the nature of the isotopes and the quantities have no relation at all to what is being shipped abroad.

Senator HICKENLOOPER. Doctor, may I ask you this. You are perfectly at liberty to answer it or not, as your judgment dictates.

Have we made, in our atomic energy program, the progress and the accomplishment in the production of atomic weapons that we would have made had the Commission vigorously accepted the program and the recommendations in general of the General Advisory Committee?

Dr. OPPENHEIMER. I think the answer to that question is "Yes."

Senator HICKENLOOPER. Has your General Advisory Committee ever, as a committee, been critical of the administrative procedures and the administrative actions of the Commission?

Dr. OPPENHEIMER. Not as a committee, sir; no.

Senator HICKENLOOPER. Have you ever communicated, either as an individual or as chairman of the committee, substantial criticism of the Commission?

Dr. OPPENHEIMER. I have; and the Commission has responded, I believe, wholly to that criticism. Do you wish me to describe this?

Senator HICKENLOOPER. Not necessarily. I do not want you to describe anything—

Dr. OPPENHEIMER. It is a perfectly well-defined point. We felt that some of the activities of the Commission would prosper more if the lines of authority were functional rather than regional; and I so advised the Commission and stated that this was the individual opinion of a number of members of the General Advisory Committee.

Subsequent to that—but I think not entirely as a result of it—the Commission in fact adopted a more functional organization. That is the only case that I can remember.

Senator HICKENLOOPER. That is all I have at this time.

The CHAIRMAN. Mr. Jackson, do you have another question?

Mr. JACKSON. I would like to see if we can clarify the issues on this. What phase of the program related to isotopes was the Commission being criticized for?

As I understand it, the shipments of isotopes started in 1947. That has been known for a long time, and maybe the statute of limitations will start running, as far as any mismanagement of that phase.

Am I to understand that the criticism was directed solely to the shipment to Norway, or is to go to the whole program of the dissemination of isotopes?

Senator HICKENLOOPER. Do you want me to answer that?

Mr. JACKSON. Yes.

Senator HICKENLOOPER. I have repeatedly said it is the principal shipment to Norway that is illustrative. I have nothing against Norway; no one has anything against Norway. They are our allies and our friends.

But it is the principle of opening the gates, if you please. It is the camel getting its head under the tent and the shipment of isotopes which can be used and which, if this policy is continued, undoubtedly will be used for industrial investigation which in turn can be used in various parts of the world inimical to our own national defense.

It is a question of having it carried step by step to further release of information in a policy which I think should not at this time, without a change in the law, at least, and good consideration, be adopted.

Mr. JACKSON. The shipments prior to the Norwegian shipments, then, are satisfactory?

Senator HICKENLOOPER. I have said repeatedly that I am not raising that question at this time.

Dr. OPPENHEIMER. I think there is a general point. The attempt to maintain a monopoly of atomic weapons is a holding operation. It is an important holding operation. It is not an operation that can go on indefinitely.

The British have powerful reactors; the French have a weak reactor; and presumably will have a powerful one.

We have a great interest in not overstimulating the development of atomic energy abroad. If we try to act as though 1950 were 1945, we will be defeating the very security we are trying to achieve.

It is not that it would not be desirable to hold this monopoly; it is that it is not possible.

Senator HICKENLOOPER. But, Doctor, we have talked a great deal about building atomic weapons abroad. This does not necessarily go to the building of atomic weapons. It goes to industrial potentials which can kill people just as well as atomic weapons can kill people and which can defeat a nation in war if they have a superabundance

of them or better equipment, just the same as atomic weapons can kill people in war.

And this is that point and not the fabrication of atomic weapons that I believe is one of the vital and important points involved in this particular new policy.

At least, I consider it a new policy.

Mr. JACKSON. Mr. Chairman, I have one last question.

The CHAIRMAN. All right, Mr. Jackson.

Mr. JACKSON. Mr. Chairman, I believe there have been some statements made here to the effect that when you ship isotopes abroad, we have no control over them; that there is always a possibility that instead of being used for medical research, they might be used for research in basic metals and so on.

I would like to ask this question: If that is true, how can we carry on any phase of the isotopic program if we do not have faith in the countries that we make these agreements with?

Senator HICKENLOOPER. Mr. Chairman, I would answer that: If we could control the situation with absolute assurance, the same argument could be used in favor of giving away the entire scientific methods and details and techniques of making atomic bombs.

Mr. JACKSON. I do not think it applies at all, Mr. Chairman, for the simple reason that Dr. Oppenheimer has testified that the materials that are being shipped do not have anything to do with the bomb, that their purposes are for basic research. As long as the fissionable products are not exported there is no danger. Is that correct, Dr. Oppenheimer?

Dr. OPPENHEIMER. That is about it.

Mr. HINSHAW. Mr. Chairman?

The CHAIRMAN. Mr. Hinshaw, may I interject a question?

Mr. HINSHAW. Certainly.

The CHAIRMAN. As I understand it, doctor, the basic proposition you advance is that the radioisotope is not the source of atomic energy as we have heretofore considered it. Is not that the basic proposition?

Dr. OPPENHEIMER. On the legal side, I think that atomic energy should be so defined. On the substantive side, I think the procedure of making materials for basic studies abroad contributes to the security of this country in innumerable ways, and that the record of our own use of these materials shows how insignificant and illusory the dangers are.

The CHAIRMAN. Radioisotopes, it is claimed, are useful for industrial purposes. It is atomic energy for industrial purposes that we intended to prohibit by law.

Dr. OPPENHEIMER. I think this mean kilowatts.

The CHAIRMAN. Now, radioisotopes, not being atomic energy, as it is scientifically defined, are not connected with the prohibition that is contained in the statute against the dissemination of information with respect to the use of atomic energy for industrial purposes; am I correct about that?

Dr. OPPENHEIMER. That is an interpretation of the law which strikes me as sound common sense. I do not know what more I can say. Atomic energy is not a scientific phrase.

The CHAIRMAN. As the author of the act, that was my interpretation.

Dr. OPPENHEIMER. Good.

The CHAIRMAN. Mr. Hinshaw?

Mr. HINSHAW. Doctor, for the purposes of our information, in science what is the definition of 1 millicurie?

Dr. OPPENHEIMER. It is one one-thousandth of a curie. And a curie is defined as a rate of disintegration. It is the rate of disintegration of one gram of radium. It is the number of nuclear events occurring per unit of time. A millicurie is one one-thousandth of a number of nuclear disintegrations occurring when you have a gram of radium.

Mr. DURHAM. What part of a grain, Doctor?

Dr. OPPENHEIMER. A gram. A gram is a thousandth of a kilogram, about one four-hundredths of a pound.

Mr. HINSHAW. May I ask, then: Quantitatively, can one point out what I millicurie of carbon 14 is in terms of weight of carbon 14?

Dr. OPPENHEIMER. I can figure it out, but it will take a little while.

Mr. HINSHAW. I wouldn't ask you to do that here. But on page 10 of the Commission's Fourth Semiannual Report, as read by Senator Knowland, it refers to the fact that—

In the Oak Ridge pile more than 200 millicuries of carbon 14 were produced; millions of times more than the amounts previously available. The operating cost was about \$10,000—

which, as I figure, would be about \$50 per millicurie.

Dr. OPPENHEIMER. The answer is roughly one one-thousandth of a gram, a millicurie.

Mr. HINSHAW. A ten-thousandth of a gram?

Dr. OPPENHEIMER. Roughly.

Mr. HINSHAW. Then it says:

Theoretically it would take 1,000 cyclotrons to equal this output. The operating cost would be well over \$100,000,000—

which I figure to be \$500,000 per millicurie. That is a very expensive little item.

Dr. OPPENHEIMER. It certainly is. It was discovered just before the war. The normal carbon isotope that was used in research was carbon 11, which is cheap to make, but it lasts a very short time. And in studying the growth of plants, where processes are slow, and the natural times of the orders of days, it was very hard to make progress.

The discovery of carbon 14 is one of the great events in the history of biochemistry and biology. And it does not take much because you do not detect the material by weighing it; you detect it by the radiation it emits. And that is a very sensitive way of detecting material.

Mr. HINSHAW. I take it it would be worth about \$5,000,000,000 a gram at the amounts you produce it.

Senator HICKENLOOPER. Mr. Chairman, I would like to ask Dr. Oppenheimer: These comparisons, when people say "A milligram is so little you can hardly see it," in dealing with this particular nuclear science submicroscopic amounts have been very, very important to many of these things, have they not? And very, very small amounts, almost unseeable smears, have been very important, and give very important answers?

Dr. OPPENHEIMER. In precisely the sense in which I spoke to Senator Knowland. If you have a rising production and you want to be ready on A-day and not have any loose ends, then you have got to take advantage of the first time you get a little smudge of something.

If you do not care whether you are ready in February or in April, I do not think the small amounts have any great consequence.

Senator HICKENLOOPER. But in determining rates of decay, for use in bombardments that give you certain answers, infinitesimal amounts almost are very important in those researches, are they not? You do not have to have a pile as big as a teacup.

Dr. OPPENHEIMER. Let me testify that infinitesimal amounts of some of these materials got us so thoroughly confused that we might have been better off if we had not had them. You get information, but what you get is not always right.

Senator HICKENLOOPER. You started some of the original studies, when this enterprise began as an enterprise, with very, very small amounts, and you had to run cyclotrons for a long period of time to develop even 1 millicurie or less.

Dr. OPPENHEIMER. That is absolutely right. I want to emphasize the importance of this was in meeting a deadline, rather than in accomplishing a successful project.

Senator KNOWLAND. Doctor, if a person, or country X, did not have the bomb, they might consider that they were trying to meet a deadline and therefore might put top priority on getting their hands on a very small amount. Is that not correct?

Dr. OPPENHEIMER. It is certainly conceivable.

The CHAIRMAN. Doctor, we do not want to keep you unduly, but I want to ask you a question about the morale of the scientists associated with the atomic energy program, compared to what it was in the past. Is it good, better, or worse? What is your estimate of that?

Dr. OPPENHEIMER. I think the first years of the Commission's administration were in many places a period of great solidification of morale. The laboratory that is closest to me is Los Alamos, and it has certainly changed from the laboratory that was insecure and rather hesitating in its technical work, to a forward-looking, vigorous establishment.

The morale of the scientists engaged in making weapons of war is always going to be an unstable thing. We know that. We do the best we can.

A fair, considerate administration is one indispensable thing, and it is my belief—I would like to testify to this—that one of the real reasons for the success of the project is that the Atomic Energy Commission, the Commissioners under the Chairman of the Commission, have understood that the program was only so good as the morale of the men that were doing the work.

The CHAIRMAN. One final question, Doctor. Are you satisfied with our weapon progress since the end of the war?

Dr. OPPENHEIMER. It is my business not to be satisfied, but I am. It is my business to try to find points where it should be criticized. But it is far better than I thought it would be.

The CHAIRMAN. Senator Hickenlooper?

Senator HICKENLOOPER. Doctor, you spoke a while ago about new weapons being tested. Is it not a fact that the new weapons that have been tested were weapons the basic design of which had been developed under the Manhattan District, and that this was merely going forward and improving those basic designs?

Dr. OPPENHEIMER. Some features of the weapons tested were features which I asked General Groves to let me incorporate in the

bomb that did not go to Japan because the war was over. Other features were features which we did not then know how to realize, though we knew very well that we ought to try.

The realization of these is a technical achievement which is not trivial. The present work of the Los Alamos Laboratory is on a series of things, all of which were somewhere in the air, surely, but which looked very hard to do and very tough to the wartime Los Alamos Laboratory.

I think this is just the way it ought to be. They have cleaned up things left over from the past, and they have found new things to do; and this is the root of progress.

Senator HICKENLOOPER. One other question about the morale, the scientific morale.

After the bomb dropped on Hiroshima, and the war was coming to an end, there was a period there of very substantial doubt when no one knew what the future of the atomic energy program would be.

Dr. OPPENHEIMER. Of course.

Senator HICKENLOOPER. In fact, no one knew what we were going to do about it at all.

Dr. OPPENHEIMER. Right.

Senator HICKENLOOPER. So in the last phase of the Army operation people were merely marking time; is that not true? Because they did not know what the plan for the future was. And it was not until the Atomic Energy Act was passed and the policy of this country was written into law, and they knew that a civilian group was going to be appointed to take it over, that anybody could really rely upon what the policy of the country would be.

Dr. OPPENHEIMER. That is right.

Senator HICKENLOOPER. Now, then, during that period of time, and up until the time that the Commission took over, there was still a marking of time until the policies to implement the law had been put into effect by a new Commission.

Dr. OPPENHEIMER. Right.

Senator HICKENLOOPER. So that to that extent is it not that the main extent to which the so-called morale was a little shaky, the uncertainty and the period—

Dr. OPPENHEIMER. That is one of the factors. I think that it can be put awfully simply: When the war was over most scientists hoped, as did most Americans, that we would not have a cold war next, but that we would have peace. And that year, during which the Commission was being established and the law written, was also the year in which it was becoming clear that we were not going to have peace, and that we were going to have to have a lot of talented young American scientists working on atomic energy problems for destructive purposes.

I do not believe that you could have expected a very flourishing performance between the summer of 1945 and the fall of 1947. And it was not the intention of the General Advisory Committee, nor mine, to reflect on the administration of the project then, but only to indicate that what the Commission inherited was a tough cookie.

Senator MILLIKIN. Mr. Chairman?

The CHAIRMAN. Senator Millikin?

Senator MILLIKIN. Dr. Oppenheimer, scientists are willing to adjust themselves to the security necessities of these situations, are they not?

Dr. OPPENHEIMER. Many are. I think some prefer, if they can, to work on other things.

Senator MILLIKIN. I remember very well when we were having our hearings, many of the scientists were willing to make a world-wide dissemination of the whole subject, in theory and in practice. That gave me the impression that scientists were probably not as conscious of the security angles or not as appreciative of the security angles as the rest of us were. But aside from that, there is an overriding security interest in this subject established by law.

I come back to my simple question: Are the scientists willing to adjust themselves to the necessities of that until we get this world fixed up for peace?

Dr. OPPENHEIMER. I can not really speak for all scientists. I think there are a lot who are. There are many who are not, and who keep out of the atomic energy business. There are some who are not today ready and who may be willing to do it in the future. But I think all of them would address to you the plea that you proceed with the business of getting the world fixed up for peace.

Senator MILLIKIN. I quite agree, and of course that is our main objective.

Dr. OPPENHEIMER. Of course.

Senator MILLIKIN. But until we have that, doctor, that overriding security provision will continue to exist, and I respectfully suggest scientists must adjust themselves or they should not be permitted to take part in the program.

Dr. OPPENHEIMER. I fully agree, and so do all of us.

The CHAIRMAN. Doctor, I have only one observation to make on Senator Millikin's remarks. To my recollection there was no scientist of reputation in 1945, or during the progress of the hearings in 1946, who took the attitude that there should then and there be world-wide distribution, and dissemination, of the knowledge and information about atomic energy. It is true that there were a few crackpots. We always have those in every profession. But as for the men whose testimony I now review in my mind—Bethe, Smyth, Seaborg, and yourself, and I think reference to the hearings will develop many others that I do not recall—I think it is important that the people of the United States understand that this responsible, most valuable element of our community did not take that position. Am I correct?

Dr. OPPENHEIMER. I am glad you said that, Senator. I think that scientists are no different than any other people. They want a world in which they can be free. And that is what we all want.

Senator MILLIKIN. Mr. Chairman?

The CHAIRMAN. Senator Millikin?

Senator MILLIKIN. I recall very well I had a pet question that I asked every witness when we were conducting those hearings, as to whether they favored doing what they wanted to do prior to the time that we got the world—my phrase—"postured for peace."

It was very, very difficult to get an affirmative answer to many of those questions.

The CHAIRMAN. Senator, only a reference to the hearings—your recollection may be, probably is, a good deal better than mine—but my recollection of the hearings disclosed that scientists participated before us in a discussion as to the technical means and methods by

which effective international control of atomic energy could be accomplished.

The scientists participated in the formation of our international policy. Dr. Oppenheimer was a member of that committee. He was also assisted by other members of the scientific fraternity in the formulation of those proposals. And I do not think we want to lose sight of the fact that these men of science probably appreciated more than we could the terrible problem that had been raised, and their belief that atomic energy must be effectively controlled if there is ever to be permanent peace in the world. Do you agree with that statement?

Dr. OPPENHEIMER. I certainly do.

Senator MILLIKIN. Mr. Chairman, I quite agree that they thought it should be controlled, but I think that some of the views as to who should participate in the control were quite naive.

The CHAIRMAN. Senator, it is useless, of course, to pursue this debate, because a reference to the hearings will disclose what the facts are. But at least I can say with assurance about the witness who is before us that never for one moment—and I guess I know him about as well as any Member of Congress—has he ever deviated in the slightest degree from the proposition that effective international control of atomic energy along the lines which we have made a basic policy of this Government was necessary, was just, and was right.

Dr. OPPENHEIMER. That is right.

Senator MILLIKIN. Mr. Chairman, I had raised no question about Dr. Oppenheimer.

The CHAIRMAN. I was just using his name. I said a representative and a most outstanding representative of the scientific community, in order to differentiate between what might be termed a blanket denomination of the attitude of the scientists and the one I recall.

Mr. HOLIFIELD. Mr. Chairman?

The CHAIRMAN. Mr. Holifield?

Mr. HOLIFIELD. Dr. Oppenheimer, I would like to pursue a short line of questioning which would draw the line between the origination of a program or a new scientific procedure or a new project development. The responsibility for that origination is in the scientists' hands, in the laboratories, and in the technical people's hands, is it not?

Dr. OPPENHEIMER. Very largely. It works both ways.

You cannot start to work on an idea before you have had it.

Mr. HOLIFIELD. That is true.

The point that I am trying to get at is that under wartime conditions the project was originated, the designs for procedure and so forth were set up, by scientists. The Army was placed there in the capacity of a management group, and as a security group, to carry out projects in designs which had originated in the scientists' laboratory. Is that a true statement?

Dr. OPPENHEIMER. It underestimates the contribution of the Army. The Army found and got contractors and helped contractors to build plants.

Mr. HOLIFIELD. That is true.

Dr. OPPENHEIMER. The Army built communities; the Army did a lot of things without which the job could not have been done.

Mr. HOLIFIELD. That is true.

Dr. OPPENHEIMER. The Army did not invent atomic bombs.

Mr. HOLIFIELD. In peacetime, the Commission, the Atomic Energy Commission, is responsible for the management of this tremendous project; but it does not originate any scientific developments or procedures, any more than the Army did. It is responsive to your General Advisory Committee and to suggestions made by leading scientists and laboratory heads, and so forth, as to development of projects, is it not?

Dr. OPPENHEIMER. That is a little of an oversimplification. The Commission has had on it an eminent and practical physicist, Dr. Bacher. It now has on it an equally eminent and practical physicist, Dr. Smyth. They are not foreclosed from making suggestions. And in Dr. Bacher's period of office he often did. The staff of the Commission includes many excellent and famous scientists. They are not kept from originating things.

But the Commission, as a corporate entity, of course, is unlikely to make a scientific discovery.

Mr. HOLIFIELD. I will accept that qualification because, of course, I did not mean to preclude any scientific suggestion, particularly from a scientific member of the Commission.

There is a dual responsibility for administering the program and for maintenance of security. And when I speak of security, I am speaking of all that goes along with the word "security" in this development, the establishment of the guards, the clearances, and the limitation of shipment of isotopes, and so forth.

Has it ever occurred to you, or to your committee, that the responsibility for management should be separated on the part of the Commission from the security by management? In other words, here we have the Commission responsible for management of the projects, and here we have a different entity responsible for security.

The reason I bring that question up is this: I do not know whether it is possible or not that they can be divorced; but I can foresee in the future accidents happening whereby fissionable material is lost, strayed, or stolen. And in each case, this is a highly inflammable thing from the standpoint of public opinion. A few grams goes down into the sewer and immediately somebody thinks it is on a fast boat to Russia; so immediately the whole question of atomic energy is called into question, the efficiency of it, because of some mistake made, or some deliberate violations of security.

It seems to me that if security could be separated from business management, that we would have at least a divorcement of throwing the whole atomic energy program into a turmoil, taking the time of the Commission for days and days and weeks on end, away from the work of managing this project, and place that security angle strictly on a security group.

Now, has the General Advisory Board ever considered the possibility or the practicability of divorcing those two items?

Dr. OPPENHEIMER. The straight answer to your question is: No, we have not considered it. It strikes me as a rather dangerous idea because the art of management in a job like this is to retain security and still keep alive, that is, to do some positive things, to get some work done.

The danger of two organizations, one of which says no and the other of which says yes, is that they are in constant deadlock. The best security is that of the grave. And the cure for the disease which

you have brought up, namely, a morbid preoccupation with the commission's stewardship of security, seems to me to lie in a far better perspective on all of our parts as to what security is, what it can achieve, how important the alleged lapses are, a perspective in the light of which I would predict that most of the preoccupations of the past years will appear to have been addressed to the wrong problem.

Mr. HOLIFIELD. That is the point that I wanted to develop, whether there was a possibility or not. You tell us that there is not a possibility, a practical possibility, of divorcing security from business management.

Dr. OPPENHEIMER. There is a practical possibility, but I think things would be worse.

Mr. HOLIFIELD. You think it would bring about such conflict of authority in the handling of documents—

Dr. OPPENHEIMER. The best personnel security is to hire no one. There is then no possibility that any dangerous person will be hired. But you cannot run a program that way.

The best guarding is simply to lock everything up and not let anyone in. But you cannot run a plant that way. These conflicts are always bound to come at you.

Mr. HOLIFIELD. Then it is the considered judgment of men like yourself that this must proceed on the present basis. As you say we must have an understanding of what is security and what is not security, and what is a calculated risk and what is not a calculated risk?

Dr. OPPENHEIMER. And what it can achieve.

The CHAIRMAN. Doctor, as I understand it, you are to depart for the west coast on a business trip?

Dr. OPPENHEIMER. I am going to teach summer school at the University of California.

The CHAIRMAN. How long will you be gone?

Dr. OPPENHEIMER. Probably a period of 10 weeks. It is not a business trip; it is actually to teach school.

The CHAIRMAN. That is business.

Dr. OPPENHEIMER. I need hardly say that the matters before you are of such moment that if in any way I can be of help to you I regard it as an obvious duty.

The CHAIRMAN. Thank you very much. There is one field that I wish to explore with you in executive session that to me is extremely important. I will try to make it at your convenience, but certainly before this investigation concludes.

If there are no further questions, I will recess this meeting. We will meet this afternoon in executive session at 3 o'clock in the usual meeting room.

I cannot let you go, doctor, without extending my own personal thanks for your intelligent testimony that you have given here today.

Dr. OPPENHEIMER. Thank you.

(Thereupon, at 12:55 p. m., the joint committee adjourned, to reconvene at 3 p. m. in executive session.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

WEDNESDAY, JUNE 15, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to call, at 10:36 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon (chairman), Representative Durham (vice chairman); Senators Tydings, Vandenberg, Knowland, and Hickenlooper; Representatives Holifield, Price, Jackson, and Elston.

Also present: Senator Edward J. Thyne, and Senator Arthur V. Watkins.

David E. Lilienthal, Chairman; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Carleton Shugg, Deputy General Manager; Joseph Volpe, Jr., General Counsel; Everett Hollis and Bennett Boskey, Office of the General Counsel; Walter J. Williams, Director, Division of Production; Morse Salisbury, Director, and Rodney Southwick, Division of Public and Technical Information Service; C. F. Townsend, Division of Information; Edward Brosnan, Division of Security; Frances Henderson, Assistant to the Chairman; Fred C. Schlemmer, Manager, Don B. Sturgis, W. P. Cornelius, Lloyd D. Bergeson, and William Waugh, Office of Hanford Operations, all of the United States Atomic Energy Commission.

G. R. Prout, vice president and general manager, Nucleonics Department, H. A. Winne, vice president in charge of engineering, R. W. Neblett, assistant general manager, Nucleonics Department, and Forrest D. Baker, comptroller, Nucleonics Department (Hanford Works), all of the General Electric Co.

The CHAIRMAN. The committee will come to order.

Mr. Lilienthal and members of the Commission, you may come forward.

**STATEMENT OF DAVID E. LILIENTHAL, CHAIRMAN, ACCOMPANIED BY CARLETON SHUGG, DEPUTY GENERAL MANAGER, AND JOSEPH VOLPE, JR., GENERAL COUNSEL, UNITED STATES ATOMIC ENERGY COMMISSION; H. A. WINNE, VICE PRESIDENT IN CHARGE OF ENGINEERING; F. E. BAKER, COMPTROLLER; AND G. R. PROUT, VICE PRESIDENT, NUCLEONICS DEPARTMENT, GENERAL ELECTRIC CO.**

The CHAIRMAN. Gentlemen, we have before us this morning for an open hearing the matter of the construction at Hanford of facilities there, which started at an estimated cost of \$6,250,000 and has ended

up costing in the neighborhood of \$25,000,000. That matter has been the subject of some brief discussion in an executive session of the committee and has been the subject of study by the Commission staff and its chairman for the past 2 months.

I think I should say for the record that Dr. Winne, vice president of the General Electric Co., who is here with us this morning; Mr. Milton, another vice president, and I had a conference on this subject about 6 weeks ago. Would that be about right?

Mr. WINNE. Perhaps more nearly 4 weeks. I am not exactly sure.

The CHAIRMAN. I know you were sick at the time, so your recollection of it would be better than mine.

At any rate, this is the matter which Senator Hickenlooper had advised the committee he wishes to inquire into today in open session. Senator Hickenlooper, if you are ready you may proceed.

Senator HICKENLOOPER. Mr. Chairman, in view of the fact that the matter this morning, I believe, has a direct bearing on matters of mismanagement and in order to make the record chronologically understandable, I would like to put in for the record this morning certain observations that have been made by official groups of the Government from time to time in the past regarding their observations of the business operations of the Commission.

I would like to first read from the House Report of the Appropriations Committee on the Supplemental Independent Offices Bill for 1949. That is of the Eightieth Congress, pages 2, 3, and 4 of that report, their conclusions as a result of their hearings at that time. I am quoting from their report:

The committee is not satisfied with its relations to date with the Atomic Energy Commission. The committee is fully aware of the vital importance, particularly under present world conditions, of the work of the Commission and of the technical aspects connected with it and is desirous of making every provision for its adequate support.

However, the Commission's refusal to furnish the committee with information and appraisals of its various budgeted items, based on technical information, which can be available only to the Commission because of the scientific and secret character of the work involved, leaves much to be desired in establishing the confidence which the committee must have if it is to continue to supply these large grants of funds under conditions of secrecy which prevent full disclosure of details involved.

As a matter of fact, there is some feeling among the members of the committee that the Commission has taken advantage of its strategic position in modern military defense to avoid facing the practical realities on less important and subsidiary elements of the budget. The impression left with the committee is one of general extravagance.

That is the end of that quote, and there is a citation then of some appropriation figures which are given.

Senator TYDINGS. What was that taken from?

Senator HICKENLOOPER. From the Appropriations Committee report of the House of the Eightieth Congress, second session.

The committee report continues:

The committee specifically recommends the reduction of \$6,400,000 in the item "Administrative expenses." Such a reduction will leave a total of \$26,473,213 available, which is slightly above the amount provided in 1948.

Careful check by the committee of the administrative structure of the Commission, as compared with other agencies of the Government, leads to the conclusion that the Commission has indulged itself lavishly in this regard. The Commission is exempt from many requirements imposed on other agencies of the Government, and the Commission's work is simplified on that account.

The Congress in allowing a single item budget, with few limitations and restrictions, has conferred upon the Commission a degree of authority and autonomy which normally does not obtain and which should be so administered by the Commission as to assure a stewardship above reproach. The establishment of a lavish administrative structure does not impress the committee as comporting with the appropriate use of these broad authorities.

A reduction of \$2,700,000 in town operations is recommended. A scrutiny of the information submitted to the committee indicates that the Commission has not achieved any real comparability between the three communities operated either in their accounting or financial reporting, and that it has not apparently achieved any satisfactory common denominator for the various types of expenses involved to regulate the actual outlays of the three communities.

By comparison with the statistics compiled by the Department of Commerce relating to comparable per capita costs for 200 cities from 25,000 to 50,000 population, the costs of the three communities are very much out of line.

Then, Mr. Chairman, I will read from the report of the Independent Offices Appropriation Subcommittee of the House of Representatives Appropriation Committee of the Eighty-first Congress, which has just been released. The committee in granting appropriations for the Atomic Energy Commission for the fiscal year 1950 on page 7 of its report has this to say:

In connection with the above reductions it should first be noted that the committee has recommended substantially no cut in funds for program 300-Weapons and program 400-Reactor development which is about one-third of the total AEC program. These two programs dealing with projects which might be described as our first line of defense are regarded as of the utmost importance to our national security, and the committee does not feel justified in effecting economies in this field of atomic development. The net result of the recommendation of the committee as to these two programs, due to the decrease in the cost of materials, supplies, and equipment since this estimate was prepared last fall, is to provide funds and authorizations about 15 percent in excess of that contemplated in the estimates.

That is the end of that quotation from page 7 at that point.

I call attention to the fact that in approximately one-third of the Commission funds, which is the 300-Weapons and 400-Reactor development, the Appropriations Committee has definitely said that they will in no way skimp on the item of national defense.

The total of those two items in cash and contract authorization for the Atomic Energy Commission recommended in this bill is \$309,500,000, and that represents, as the committee says, approximately one-third of the program. So that there is somewhere in the neighborhood of, let us say, 35 to 40 millions of dollars represented by shrinkage in material costs that have been left in this recommendation and gives a very substantial and sizable cushion. Indeed, according to the Appropriations Committee of the House, which will not cramp the Commission in any way in the weapons or the national security end of the thing.

Continuing reading this next paragraph from this same report, the committee says—referring to the reductions made by the committee in other programs:

\* \* \* it is believed that sufficient funds and authorizations have been allowed to permit continuation and obtain satisfactory progress in the several fields in which the Commission is operating. However, there is no intention to cripple any activity of this important agency, and the committee feels that if the Commission practices the economy it should in its industrial operations, town management program, and its Washington office, that additional substantial savings can be made in these programs.

In recommending a reduction of \$3,535,017 in cash and \$3,271,172 in contract authorization for the community program 700, the committee is of the opinion that the Commission should give every consideration to the reduction of expenses at the three major plants, Oak Ridge, Tenn., Los Alamos, N. Mex., and Hanford, Wash. The cost of town operations, including the number of employees hired by the contractor at each of these points, is excessive, and the Commission should require substantial reductions in new contracts to be negotiated this spring or give serious consideration to taking over operation by the Government. Likewise, the committee is of the opinion that housing construction costs should be reduced and that the Commission should not proceed with new construction until a reasonable rental structure is established. Present rentals paid by employees in the several towns are appreciably below the amount which should be paid if the Government is to get a fair return on its investment.

I read from the bottom of page 8 of the same report:

During hearings on the bill it was disclosed that in the fiscal year 1950 the Commission proposed to pay to the various universities in this country, in the form of fellowships and contracts for research, a total of \$23,378,000. The committee believes that this sum is excessive and recommends that a substantial reduction be effected in the allocation of funds for this portion of the program.

On page 9, I continue reading a sentence with respect to the accounting for the assets and the liabilities of the Commission, and the Appropriations Committee says this:

The Commission is urged to increase its efforts so that a fully adequate system of accounts may be in effect at the earliest possible date. It should accomplish this within the fiscal year 1950.

I continue reading the next paragraph on page 9:

Last year, the committee experienced considerable difficulty in reviewing the budget estimates of the Commission because of the inadequate and confused functional break-downs used. The facts and figures presented to the committee were of little or no value in enabling it to reach a logical conclusion. While the presentation was substantially improved this year, there still exists a serious deficiency in that the budget was not established on a cost basis and therefore cannot be reconciled with the figures developed under the accrual system of accounting now being installed by AEC with the approval of the Comptroller General. It is imperative that budget estimates in the future be integrated with accounting results and procedures.

Now, Mr. Chairman, I put those in the record at this time because in the near future I expect to discuss these matters, and I put them in so that any canvass of this situation can later be made and so that information as to my intention along those lines can be made known.

Mr. LILIENTHAL. May I ask whether the Senator plans to put the whole report in, because there are some pleasant remarks in this last report, which I have not heard this morning. I would suppose the whole report ought to go in.

Senator HICKENLOOPER. I assume the whole report would go in the record. Those are the particular matters I want to discuss, and the connotation of the report here that I have, at least, has eliminated those pleasant matters. I do not find any particularly happy reference to the Atomic Energy Commission in this report, but I am happy to have the entire report put in, and we can discuss it at a later date.

The CHAIRMAN. It will all go in.

Senator HICKENLOOPER. This section, Mr. Chairman, is contained in the entire report of the committee, which has other departments. I am only referring to that with reference to the Atomic Energy Commission.

The CHAIRMAN. Is that the Eightieth or Eighty-first Congress?

Senator HICKENLOOPER. This is the Eighty-first.

(The document referred to above is as follows:)

[Rept. No. 425, 81st Cong., 1st sess.]

INDEPENDENT OFFICES APPROPRIATION BILL, 1950

ATOMIC ENERGY COMMISSION

The bill includes a total of cash and contract authorization for the fiscal year 1950 amounting to \$1,090,120,397. This sum is \$76,879,603 less than the budget estimates which totaled \$1,167,000,000. The following tables give a detailed summarization of the amounts proposed in the budget estimates, the amounts recommended in the bill, and the reductions in the estimates.

It is the understanding of the committee that diversions may be made from one program to another to meet emergencies or essential changes in program which may develop since committee hearings on the bill.

The tables referred to above are as follows:

*Cash requirements of the Atomic Energy Commission for fiscal year 1950 (exclusive of amount for liquidating prior year contract authorization)*

Program	Budget estimate	Committee recommendation	Reduction
200 Source and fissionable materials.....	\$126,717,006	\$107,709,455	\$19,007,551
300 Weapons.....	109,533,076	109,000,000	533,076
400 Reactor development.....	52,921,460	52,500,000	421,460
500 Physical research.....	13,129,383	11,159,976	1,969,407
600 Biology and medicine.....	11,452,353	9,734,500	1,717,853
700 Community program.....	23,566,772	20,031,755	3,535,017
800 Administrative services.....	27,675,228	23,523,944	4,151,284
Transfer to Public Health Service.....	4,722	3,250	1,472
Total (exclusive of amount for liquidating prior year contract authorization).....	365,000,000	333,662,880	31,337,120

*Contract authorization of the Atomic Energy Commission for the fiscal year 1950*

Program	Budget estimate	Committee recommendation	Reduction
200 Source and fissionable materials.....	\$172,098,155	\$146,283,432	\$25,814,723
300 Weapons.....	100,675,799	100,000,000	675,799
400 Reactor development.....	67,277,580	67,000,000	277,580
500 Physical research.....	42,190,758	35,862,144	6,328,614
600 Biology and medicine.....	21,412,182	18,200,355	3,211,827
700 Community program.....	21,807,814	18,536,642	3,271,172
800 Administrative services.....	1,537,712	1,307,055	230,657
Total contract authorization recommended for fiscal year 1950.....	427,000,000	387,189,628	39,810,372

*Recapitulation of cash and contract authorization for fiscal year 1950*

	Budget estimate	Committee recommendation	Reduction
Cash for liquidating prior year contract authorization.....	\$375,000,000	\$375,000,000	-----
Cash for fiscal year 1950 (exclusive of amount for liquidating prior year contract authorization).....	365,000,000	333,662,880	-\$31,337,120
Total amount available for expenditure in fiscal year 1950.....	740,000,000	708,662,880	-31,337,120
Less reappropriation of unobligated balance of prior year appropriations.....	-----	5,732,111	-5,732,111
Recommended appropriation for fiscal year 1950.....	740,000,000	<sup>1</sup> 702,930,769	-37,069,231
Contract authorization for fiscal year 1950.....	427,000,000	387,189,628	-39,810,372
Total cash and contract authorization, 1950.....	1,167,000,000	<sup>1</sup> 1,090,120,397	-76,879,603

<sup>1</sup> And reappropriation of unobligated balance of \$5,732,111.

In connection with the above reductions it should first be noted that the committee has recommended substantially no cut in funds for program 300-Weapons and program 400-Reactor development which is about one-third of the total AEC program. These two programs dealing with projects which might be described as our first line of defense are regarded as of the utmost importance to our national security and the committee does not feel justified in effecting economies in this field of atomic development. The net result of the recommendation of the committee as to these two programs due to the decrease in the cost of materials, supplies, and equipment since this estimate was prepared last fall is to provide funds and authorizations about 15 percent in excess of that contemplated in the estimates.

Referring to the reductions made by the committee in other programs it is believed that sufficient funds and authorizations have been allowed to permit continuation and obtain satisfactory progress in the several fields in which the Commission is operating. However, there is no intention to cripple any activity of this important agency and the committee feels that if the Commission practices the economy it should in its industrial operations, town-management program and its Washington office, that additional substantial savings can be made in these programs.

In recommending a reduction of \$3,535,017 in cash and \$3,271,172 in contract authorization for the community program 700, the committee is of the opinion that the Commission should give every consideration to the reduction of expenses at the three major plants, Oak Ridge, Tenn., Los Alamos, N. Mex., and Hanford, Wash. The cost of town operations including the number of employees hired by the contractor at each of these points is excessive and the Commission should require substantial reductions in new contracts to be negotiated this spring, or give serious consideration to taking over operation by the Government. Likewise, the committee is of the opinion that housing construction costs should be reduced and that the Commission should not proceed with new construction until a reasonable rental structure is established. Present rentals paid by employees in the several towns are appreciably below the amount which should be paid if the Government is to get a fair return on its investment.

The committee has recommended a reduction of \$4,151,284 in cash and \$230,657 in contract authorization in connection with program 800—Administrative services. The total employment proposed for this work in the next fiscal year is 4,633.4 man-years, which is 18.3 man-years in excess of the number authorized for the current fiscal year. In addition to the Washington staff, administrative personnel are located at Oak Ridge, New York, Chicago, Santa Fe, and Hanford. The committee appreciates the fact that many of these offices have been established only recently and that there has been little time to reorganize and cut down on unnecessary personnel, but it feels that in the light of present year operations and with the earnest effort of officials administering the atomic energy program, readjustments can and should be made to permit efficient operation within the amount allowed by the committee.

One of the most important discussions during the hearings centered around the inquiry into the device used by the Commission in connection with its program for the production of fissionable materials. It is the understanding of the committee that this procedure applies to other parts of the atomic energy program. The device referred to consists of a procedure whereby the Government supplies the contractor with monthly advances of funds for the operations which he is conducting. The contractor supplies no funds and consequently assumes no risks in his operations under these circumstances. In effect, he is operating on a cost-plus basis which is the most expensive method of operating. Likewise, the committee wishes to call attention to the fact that under these conditions, a strike called at any of these plants is, in effect, a strike against the Government of the United States, such employees being paid entirely from Government funds. The committee calls this situation to the attention of the appropriate legislative committee and to the members of the Atomic Energy Commission with the recommendation that steps be taken to correct this undesirable situation.

During hearings on the bill it was disclosed that in the fiscal year 1950 the Commission proposed to pay to the various universities in this country, in the form of fellowships and contracts for research, a total of \$23,378,000. The committee believes that this sum is excessive and recommends that a substantial reduction be effected in the allocation of funds for this portion of the program.

Another matter which came to the attention of the committee during the course of the hearings was the inequity which exists in the State of New Mexico, where

the State collects a sales tax from employees of the Commission located in the State, such tax being collected for the support of schools throughout the State. No part of this tax is apportioned to schools operated for the benefit of the children of employees of the Commission. The committee recommends that appropriate steps be taken to secure an understanding with State officials, and, if necessary, the State legislature, to secure a fair distribution of these funds.

As a part of the joint program for improving accounting in the Federal Government the General Accounting Office has been working with AEC in the development of accounting standards and procedures suited to the special needs of the industrial-type programs carried on by the Commission through contractors. The committee is glad to note the efforts of AEC in its development of accounting for assets, liabilities, income, and expense on the accrual principle, and the provision for development of functional costs. The Commission is urged to increase its efforts so that a fully adequate system of accounts may be in effect at the earliest possible date. It should accomplish this within the fiscal year 1950.

Last year, the committee experienced considerable difficulty in reviewing the budget estimates of the Commission because of the inadequate and confused functional break-downs used. The facts and figures presented to the committee were of little or no value in enabling it to reach a logical conclusion. While the presentation was substantially improved this year, there still exists a serious deficiency in that the budget was not established on a cost basis and therefore cannot be reconciled with the figures developed under the accrual system of accounting now being installed by AEC with the approval of the Comptroller General. It is imperative that budget estimates in the future be integrated with accounting results and procedures.

In submitting a recommendation to the committee in connection with the reappropriation of unobligated balances the Commission suggested that language be added to the bill authorizing the merger of the 1950 appropriation with the obligated balances of prior appropriations which, in effect, would provide a single account for all funds available to the Commission after June 30, 1949. While the committee is impressed with the value of this procedure from an accounting standpoint, it is not ready to go along with the Commission in recommending the proposal at this time. The committee is reinforced in its stand by the fact that one of the Government agencies directly concerned has not approved the plan. Also, the committee is not inclined at this time to favor the granting of a one-fund continuing appropriation for administration and operating purposes. It is believed that no other Government agency operating on a large scale has this unlimited authority as to administrative and operating expenses. The committee will be glad to consider such a proposal in connection with the 1951 estimates, provided administrative and operating expenses are separated from construction funds, and provided also that all agencies of the executive branch concerned are in agreement on the program.

\* \* \* \* \*

Mr. HOLIFIELD. Mr. Chairman?

The CHAIRMAN. Mr. Holifield?

Mr. HOLIFIELD. What is the procedure? I arrived late.

The CHAIRMAN. As I understand it, the Senator was giving notice to the Commission of some matters he intends to examine into in the near future, and those matters are contained in the report of the Subcommittee on Appropriations of the House.

Mr. HOLIFIELD. Does the Senator wish to continue on uninterrupted to the end of his presentation?

Senator HICKENLOOPER. I had merely read these items into the record, saying that at a later date I expect to go into them, and it is a matter of informing the Commission of the general field of inquiry.

The CHAIRMAN. So that the Commission might know what it would be called upon to meet in the future.

Mr. LILIENTHAL. May I ask a question or two about that phase of the hearing?

The CHAIRMAN. Yes.

Mr. LILIENTHAL. The references Senator Hickenlooper has made involve a number of rather broad questions on which we had hoped

to be heard in that phase of the hearings this summer in which, let us say, the Commission's presentation is to be heard.

We would prefer it if at the time these matters are brought up in the form of charges that the Commission's response be as broad as the charges and include, for example, such matters as the simplicity of the operation referred to. We would like to spend quite a lot of time indicating—I think it would be very illuminating—how unsimple are the operations under conditions required by law, and a rather extensive report on town operations, because here a great many changes have been made and made in the direction of economy and efficiency.

Instead of deferring those until, say, sometime in August, if we could cover these at the time these charges are made——

The CHAIRMAN. Sometime when, Mr. Lilienthal?

Mr. LILIENTHAL. I said August. I was assuming this would take quite a long time.

The CHAIRMAN. I have more speedy ambitions.

Mr. LILIENTHAL. I cannot say I am disappointed, Senator.

The CHAIRMAN. Of course, there is no intention of limiting your right to answer this, Mr. Lilienthal.

Mr. LILIENTHAL. That is what I had in mind.

The CHAIRMAN. There will be none at any stage of the proceedings.

Mr. LILIENTHAL. My purpose in raising the question was in order to make this presentation and make it in a constructive and orderly way and people will be required from various parts of the country; and as much notice as we can get will be helpful in getting them here without undue loss of their time, which is being paid for out of public funds.

Senator VANDENBERG. You are not notifying us of a prospective filibuster, are you, Mr. Lilienthal?

Mr. DURHAM. Mr. Chairman?

The CHAIRMAN. Mr. Durham?

Mr. DURHAM. I would like to know if the Chairman is prepared to answer this inquiry this morning.

Mr. LILIENTHAL. On some of the comments made it may be fairly important to do so right away, because one relates to an appropriation for the weapons program of this country, and the statement that has been made might lead to some confusion.

Mr. DURHAM. That is the part I am concerned about.

Mr. PRICE. I would like to ask the Chairman, if I may, whether he has been before this joint committee since this action of the subcommittee in the House.

Mr. LILIENTHAL. There have been discussions with the committee, and my recollection is the chairman of the joint committee has appeared before the Appropriations Committee on one of the serious and profound misapprehensions, serious misapprehensions.

The CHAIRMAN. I have not made a formal appearance, but I discussed the matter with individual members of the committee, and I have addressed a communication to the committee protesting against a certain cut in the budget in the sum of, I believe, some twenty-odd million dollars, having to do with source and fissionable materials. You are familiar with that particular item?

Mr. LILIENTHAL. Yes.

The CHAIRMAN. I think we all agree the cut in the House was due to a misapprehension as to what the item was really for. I think

that will be straightened out. I hope it will, and that that amount of the budget will be restored.

Mr. LILIENTHAL. I think the Senate Appropriations Subcommittee is fully aware of the facts, but the statements that have been made by Senator Hickenlooper this morning will not clarify public thinking on this subject without some further statement, which I should make perhaps now or sometime later in the day, comparable to those that have been made in open hearing to Senator O'Mahoney's subcommittee of the Senate.

The CHAIRMAN. You are referring particularly to that item I just mentioned?

Mr. LILIENTHAL. Yes; the action referred to. The House thought that they were providing no cut in weapons program, when actually this was not the case.

Mr. DURHAM. Mr. Chairman?

The CHAIRMAN. Mr. Durham?

Mr. DURHAM. I would like for Chairman Lilienthal to clear this matter up presently. I feel it is important to the country, and I do not want the country to be misinformed on this.

Senator HICKENLOOPER. Mr. Chairman, if I may just make it clear, I was merely reading from an official report of two different Congresses, the Appropriations Subcommittee of the House, reading their printed conclusions, which have been made public and which are in existence; and I was doing it on the theory that I expect to go into those matters at a later time, and I was attempting to give notice of the subject matter that I would eventually go into.

I am not here this morning prepared to argue either side of that matter at this moment. That is, I had not intended to do that this morning, and I merely intended to give notice as to the general area which would be examined.

Mr. PRICE. Mr. Chairman, since the matter has been brought up, I can see no harm in Mr. Lilienthal making comments on the remarks that have been read into the record.

Senator HICKENLOOPER. I have no objection. It was not done for that purpose.

The CHAIRMAN. I rather think, Senator, if you could make known to the committee and the Commission privately the matters that are supposed to come up, we will obviate the possibility, in the way of giving notice, of making certain allegations or at least what the country might consider to be allegations 1 day in advance of their answer being heard.

I think it is very important, and I know you want to be fair in this thing; it is very important that we try to answer things as they are brought up and not answer them 2 or 3 days later; so that we can get a decent connected situation where the charges and the answers will be made as contemporaneously as possible.

Perhaps, Mr. Lilienthal, since Senator Hickenlooper has no objection, you would like to make some comment.

Mr. LILIENTHAL. I should very much like to because a misapprehension about whether the Commission will have funds adequate to carry out the weapons program we are required to carry out or has less than that amount is a matter, of course, of very great public concern.

Mr. Carleton Shugg, the Deputy General Manager of the Commission, presented this matter to the Subcommittee on Independent Offices of the Senate Appropriations Committee the other day, and I think, perhaps, he is the best-qualified man to make it.

But just let me say this couple of sentences in regard to what the problem is.

The purpose of the House Appropriations Committee was not to reduce the funds available for the production of weapons. The effect, however, was to take some \$45,000,000—is that correct, Mr. Shugg?

Mr. SHUGG. Yes, sir.

Mr. LILIENTHAL (continuing). From that item in the Commission's appropriation presentation, which is entitled "Source and fissionable materials." Source and fissionable materials include, of course, the procurement of uranium ore throughout the world and the processes of preparing feed for these great plants at Hanford and Oak Ridge, and the further process of actually producing fissionable material that goes into the weapons.

These are not items on the open market. These are not items that would be subject to the hoped for reduction in prices for materials; nor can the cost of operations of these plants be expected to be reduced because of the special character of the materials and of the plants.

Therefore, what we have is the correct amount of money for a part of the weapons program and a \$45,000,000 reduction in that part of the appropriation attributable to filling these weapons so they are atomic weapons. Otherwise, they are quite harmless. This is not the purpose.

Senator HICKENLOOPER. Where does the \$45,000,000 occur? There is a \$19,000,000 reduction in source and fissionable material.

Mr. LILIENTHAL. Perhaps Mr. Shugg should pick up at that point.

Senator HICKENLOOPER. Here is a contract reduction from \$172,000,000 down to \$146,000,000 for source and fissionable materials purchases, which is a reduction of contract authorization for 45; is that it?

Mr. SHUGG. \$45,000,000 is the sum of the two cuts made, \$19,000,000 in the cash and \$25,800,000 in contract authorization. That action of the House on the source and fissionable material program is a flat 15-percent cut. It was similar to the action taken on all of the programs except for weapons and reactor development. All programs were simply cut in their cash and in their contract authorization by 15 percent.

So the first and most important point is that the total cut in source and fissionable materials, all of which is pointed toward weapons, is \$44.8 million.

The second point, sir, in the House report is the hope that because the weapons program proper was not cut any more than to round off the figures, it was the hope that we would be able to do 15 percent more due to the general decrease in cost of materials and supplies, and it is only fair to state very definitely that the type of material and supplies and equipment that we have to get for our weapons is not of the type that is dropping with the general markets. We will not be able to produce more because there was no substantial cut in weapons.

And it is also, I think, sir; worth pointing out that in our budget request for fiscal 1950 as compared to fiscal 1949, that on all the programs which are by inference nonvital, in the House report, we

asked for \$23,000,000 less than in 1949. On our communities alone our total request is \$32,000,000 below 1949, which is at least some progress.

Now, the programs on which we asked for an increase in fiscal 1950 over 1949 are the three programs which are vital, as soon as one has made the correction of realizing that source and fissionable materials are just as much a part of weapons and reactor development as are those two titles themselves.

Mr. HOLFIELD. Mr. Chairman, I think the record should show at that point that the vice chairman, Mr. Durham, questioned this cut on the floor of the House and was assured by the chairman of the subcommittee of the House Appropriations Committee that the cut did not refer to weapons developments and it was the opinion of the House Appropriations Committee that they were not doing what they were actually doing.

The net result is that if you do not have fissionable material procurement and production, you have no atomic bombs.

Mr. SHUGG. That is very right, sir.

Mr. LILIENTHAL. There is one other matter, and this can be elaborated on to whatever extent the committee desires, but there is one other matter touched on by Senator Hickenlooper this morning that perhaps should be, at least in a brief way, referred to; and that is the assertions in respect to extravagance and excessive costs in the operations of these towns and the rent level—that is to say, the rentals charged employees of the Commission or its contractors at these various large towns and their relation to costs.

We will have to supply these figures in detail, but the Commission has been at work from the beginning trying to bring down the costs of the operations in these towns and to bring up the rents. There was a subcommittee appointed by this joint committee, of which Vice Chairman Durham was chairman, and they held hearings on the rent situation at Oak Ridge, and I am sure it is clear in that record and in public knowledge that the rent commission has directed an increase, has authorized an increase in rents, and the management has put such an increase into effect.

The criticisms made by the subcommittee—and we were very glad to have the subcommittee's frank views about it—were not that the increase in rentals was unjustified, as I recall it, but that the public in these communities had not been advised in the way that would make it more palatable to them. Having seen tenants and having been one who had rents increased, I think there is quite a public relations job, but, nevertheless, the point is well taken. But so far as the rental situation is concerned, steps have been taken, and rather vigorous steps have been taken, to increase the rental in all the communities, particularly Hanford and Oak Ridge.

As to reduction in force and the operation of these towns with fewer individuals and at less cost, the figures at Oak Ridge are quite remarkable. The committee has been informed about them—a reduction, a very substantial reduction, running into a good many hundreds of people, operating the same facilities.

There are also figures on the Hanford and Los Alamos situations, and, perhaps, Mr. Shugg can put those into the record at this point.

Mr. SHUGG. Mr. Chairman, may I speak briefly to one other very important statement in regard to the House understanding?

When it says that the total of weapons and reactor development is about one-third of the total AEC program, that is quite a ways out. The total of source and fissionable materials, which again is all necessary for weapons, the total of that program and weapons and reactor development is 79 percent of the total budget request, leaving 21 percent to cover all other programs—research, biology, medicine, the towns, administrative.

Senator HICKENLOOPER. I think, Mr. Chairman, it might be stated that the House report refers to a total of \$309,500,000 for the two items, weapons and reactor development, in cash and contract authorizations, and that the total committee recommendations were somewhere around a billion in cash and contract authorizations, and I presume that is where they get their figure of one-third.

Mr. SHUGG. May I say again there, Mr. Chairman, that the \$1 billion, the figures that over \$1 billion are only obtained by adding to our new obligational authority for the coming fiscal year, the cash to liquidate prior years' obligations, which is not available in itself, however, for new obligations.

Our total request for new obligational authority was \$792,000,000.

Senator HICKENLOOPER. Would you say, Mr. Shugg, that the House report is in substantial error, then?

Mr. SHUGG. In regard to the percent of our program, Senator, which is necessary for weapons and reactor development—

Senator HICKENLOOPER. Would you say that the House Appropriations Committee just did not understand what it was doing when it made up this report?

Mr. SHUGG. We may not have made that source and fissionable-materials program properly clear to them, Senator. Of course, in those hearings a great deal of the detailed questioning is on matters which are more familiar to the members.

The CHAIRMAN. All right.

Now, gentlemen, you will have an opportunity to go into these matters at more length and more detail later, but I presume that we are now ready to take up the Hanford project.

Senator HICKENLOOPER. Mr. Chairman, this morning I want to refer to a matter which I think is quite astounding. The official report to the Commission on this matter is marked "Secret," consisting of some 46 typewritten pages in the main report and an appendix called appendix B which consists of a photostat and 14 other pages. The report, as I say, is marked "Secret" on every page. I would like to have the record show that on the last executive meeting of the committee, I brought this report to the meeting and submitted the report to the committee there and that the Commission was present.

I stated that I did not want to have, and did not have, the authority to declassify documents that had been classified and that in my opinion this report almost in its entirety, with the exception of a few phrases and references, did not contain classified information, but that that was my own personal incompetent opinion. I am not a classifier of documents.

Therefore, I asked the committee, and the chairman suggested we should discuss the matter with the Commission. That was discussed, and, as I understand it, it was universally agreed that matters in this report, with the exception of specific reference to processes or purposes, could be used. I merely want that clarified at the outset.

I have prepared an outline of this report, which has eliminated reference to purposes and techniques, and on that basis I would like to proceed, Mr. Chairman.

The CHAIRMAN. You may proceed, Senator.

Senator HICKENLOOPER. Mr. Chairman, this is a report made by a board appointed by the Commission on March 12, 1949, to examine into the unusual circumstances surrounding a construction project at Hanford, Wash., known as the 234-235 Facilities. This board, appointed by the Commission itself, consisted of Walter J. Williams, Director of the Production Division of the Commission; Mr. Paul M. Green, Controller of the Commission; Mr. Adrian S. Fisher, General Counsel of the Commission; so that the board examining this project was a creature of the Commission itself and the members were employees or officials of the Commission.

The history of this project is this: In 1947 the desirability of this project was noted by the Commission and by its officials. There is an original letter—this letter that I am referring to is a letter of Mr. Carroll Wilson—of May 6, 1947, directed to Dr. Winne, of the General Electric Co., and there is a statement in the file that the need for this particular project has been noted by the Commission prior to that time, some considerable time, but that goes back far enough.

In the report on page 2 is a statement of the board:

This project has recently become a cause of concern because of the substantial overrun in cost in this construction.

Now, after the preliminary examination of this proposed project and on December 3, 1947, after Commission consideration, and authorization for the entire cost of the work, based upon estimates in the amount of \$6,255,000 was issued and construction completion was then set for April 1, 1949.

Apparently, work proceeded with the planning—I shan't burden the Committee with a detailed reading of the report, but apparently work proceeded with the planning, and on February 9, 1948, there was a revised estimate made by the General Electric Co. to the Atomic Energy Commission area manager at Hanford, which revised the estimates from \$6,255,000 to \$10,432,900.

Mr. JACKSON. What was the date of that?

Senator HICKENLOOPER. That was on February 9, 1948.

On March 12, 1948, there was an estimate that was increased by the Hanford AEC to \$11,933,900. I can give the page number of these, if desired.

This amount or this estimate by the Hanford AEC management was transmitted to Washington as a part of the Hanford AEC budget, and the statement in the report is that it was simply lumped into the AEC budget and put through on the appropriation.

During the week of June 28, 1948, a General Electric spokesman commented during a meeting with the AEC that he believed the project would cost 13 to 15 million dollars. That is page 9 of the report.

On July 6, 1948, the AEC Manager requested an accurate cost estimate. On July 12, General Electric submitted a net estimate of \$8,230,959, representing a reduction of \$1,120,000 caused as the result of the elimination then of one portion of the work and substitution of another portion. That is found on page 10 of the report.

The report states that there was no review of this estimate by the Hanford AEC or the basis upon which it was prepared. That is found on page 12 of the report.

In August 1948, also shown on page 12 of the report, the project estimate was transmitted to Washington and included in the AEC classified budget at \$8,924,000. On page 25 of the report is a statement to the effect that there were no inventory controls set up in this project, which I mention at this time out of order so far as the page is concerned because it is referring back to the loose practices that have gone on.

On November 23, 1948, the Hanford AEC authorized the expenditure of \$8,760,324. That is on page 14 of the report.

Then, in January 1949, and this is found on page 31 of the report, General Electric estimates for the completion of the entire project then jumped to \$25,219,000, showing that the costs already incurred through March 6, 1949, had been \$16,549,338, and that the estimate to complete what is called phase 2 of a three-phase operation was an additional amount of \$2,717,843, or a total amount at that time to complete this project which had started out as a \$6,000,000 project, through phase 2 of the project, of \$19,267,181.

Again referring back to this matter, and on page 33 of the report is a statement by the Commission's own reviewing board that went out last spring, and the statement is flatly made that lack of planning, mistakes in changing decisions, and similar factors all added to the cost.

As an illustration, the board gives on page 33, beginning at the bottom of page 33, the fact that a ventilating system when ready for installation was found not to fit. The design had been changed after the steel had been ordered.

The steel in the roof was spliced to raise the roof, and it was found that still the ventilating system would not fit even with the spliced alterations to the building, and so a new building was constructed to house this ventilating system that had originally been planned for the one building, adding to the cost.

Now, on page 35 of the report is a very significant thing, going to the point that I would like to try to make. It is a reference to the changing personnel, and the shifting responsibility at Hanford, and I will read as follows from page 35. All of this is from the Commission's own board that it set up, and I quote:

Until September 1, 1947, Lt. Col. F. J. Clark was Area Manager at Richland. Then for a short period Mr. Shaw was acting General Manager. Mr. Shugg took over on September 2, 1947, and was in charge until September 1, 1948; then Mr. Shaw was again acting manager until Mr. Schlemmer arrived to take over September 15, 1948.

It says:

The General Electric had as a project manager a Mr. D. H. Lauder until February 1948. He was followed by Mr. R. C. Muir, who left in December 1948. He was followed by Mr. G. R. Prout.

Still quoting from the report:

Mr. Walter J. Williams, as Manager of Field Operations, was in responsible charge of all Commission installations until September 15, 1947; and as Director of Production was responsible for construction until March 15, 1948. Mr. Roger Warner was responsible for construction from March 15, 1948, to September 15, 1948. Then as Director of Production, Mr. Williams was again given responsibility for construction on September 15, 1948.

I continue reading from the next paragraph of the report :

It is recognized that in a new organization a large number of personnel changes are natural and inevitable. Nevertheless, it should be borne in mind that these shifts in responsible positions did have an upsetting effect.

Senator TYDINGS. Senator Hickenlooper, may I ask why you are looking at this? You say this is the Commission's own report. Have you developed who prepared the report?

Senator HICKENLOOPER. I announced the board that prepared the report.

Senator TYDINGS. It must have been one individual who wrote it up, I suppose.

Senator HICKENLOOPER. No. Mr. Williams, whom I am referring to here, is one of the members of the board that went out to look this thing up last spring.

Senator TYDINGS. It is primarily his report, then?

Senator HICKENLOOPER. I will read the names again that composed this board that the Commission appointed this spring to go out and investigate. Mr. Walter Williams, Director of Production of the Commission; Mr. Paul M. Green, Controller for the Commission; Mr. Adrian S. Fisher, General Counsel of the Commission, constituted a board appointed by the Commission to go out and investigate this matter, and this is the report of that board, signed by all three members.

Senator TYDINGS. I was under the impression that it was a Commission report rather than the board that was appointed to report to the Commission.

Senator HICKENLOOPER. A report of the board to the Commission.

Senator TYDINGS. That is right.

Senator HICKENLOOPER. But the Commission appointed the board out of its own members, which gives an especial emphasis to the criticisms that this board reported to the Commission, which was its employer.

Senator TYDINGS. I just wanted to get it straightened out in my own mind.

Senator HICKENLOOPER. Now, on page 40 of the report, it is stated by this board as follows:

There is also a question as to the responsibility of the AEC for its acceptance of the July 9 estimate. At this time there were many indications which should have served as a danger signal. A budget estimate of \$10,430,900, exclusive of overhead and distributive items, had been submitted in February. Mr. Streide had indicated the view that the project might run from 13 to 15 million dollars, and the agreed changes—

elimination of one particular installation—

had accounted for a reduction of a little over a million, yet it does not appear that any AEC representative reviewed this estimate or even the methods of compiling it.

In the view of the board, any review by the AEC of the basis on which this estimate was prepared would have indicated that it was not reliable no matter how heavily endorsed by the General Electric Co.

Yet it does not appear to have been clearly understood in the AEC and Hanford the extent to which this estimate or the manner in which it was prepared should be reviewed by the AEC or precisely whose responsibility it was in the AEC to review the estimate.

In part the Hanford office appears to have been influenced by the Commission-wide policy, which is opposed to any detailed supervision of the contractors' work. This policy, however, should not have prevented the AEC officials from

satisfying themselves as to the adequacy of the General Electric Co.'s organization and procedures for estimating costs.

In the opinion of the board, moreover, there were enough danger signals to indicate that the July 9 estimate was unreliable, so that the Hanford office of the AEC should have conducted a somewhat more specific review of its accuracy.

I read the next paragraph:

Responsibility for these matters is on Mr. Shugg, who is Manager of the Hanford Operations Office. As previously indicated, responsibility in the AEC in Washington for over-all supervision of the construction was on Mr. Williams—who is one of the authors of this report—

until March 15, 1948; Mr. Warner until September 15, 1948; and then Mr. Williams.

On page 42 of the report—excuse me a moment, there is one reference here. I read further from the paragraph on recommendations on page 41 of this report:

The board agrees that the estimating has been faulty and should be improved. On the other hand, the board does not believe that a mistake in estimating of this kind can properly be attributed to the apparent inability of the company to hire one or two estimators. It can be attributed only to a lack of real capacity on the part of the company at Hanford to handle construction projects on this magnitude or a lack of concern for costs or both.

Senator HICKENLOOPER. On page 42 of the report there is a statement as follows:

There seems to have been no clear understanding either in the General Electric Co. or in the Atomic Energy Commission as to whose responsibility it was to follow the costs. As a result, responsibility for failure to use what cost reports were available rests with the top Hanford management of the General Electric Co. and the Atomic Energy Commission.

I read further:

The responsibility for getting out these reports and the transfers of responsibility during the life of this project have already been described in part two of this report. The over-all responsibility in the AEC in Washington for cost reports is in Mr. Green, the Controller—

and Mr. Green is one of the men who wrote this report.

The CHAIRMAN. They do not seem to have been easy on themselves, Senator.

Senator HICKENLOOPER. I compliment these men in making a highly critical report in which they themselves have been involved.

Mr. PRICE. They were appointed by the Commission, too, Senator.

Senator HICKENLOOPER. As I say, I compliment them on making a highly critical report which involved themselves, and I believe that they deserve commendation for what seems to be quite a factual approach to this matter.

The CHAIRMAN. For frankness and not diligence, I take it.

Senator HICKENLOOPER. Diligence will come in a little bit later. I want to be sure that I get this right.

On page 45 of the report, these men say:

Some of the AEC representatives at Hanford appear in some degree at least to have condoned this attitude of the design and construction division of the General Electric Co. It apparently was known by some AEC representatives in the fall of 1948 that the project would exceed the \$8,760,324 figure, although not to the extent later developed, but nothing was done about it.

Then, this statement is made in the report, as follows:

One reason for the attitude of the General Electric Co. can be found in the contract between AEC and the company. Under this contract the General Electric Co. has been reimbursed for all work carried out at the Hanford project. It has not been considered controlling that the total amount expended for a particular project exceeds the amount established by the directive authorizing that project, so long as the total sums obligated under the contract were sufficient to cover all costs.

On page 46 of the report, which is the last page, this board says:

It is the opinion of the board that the overhead costs on the 234-5 project and the total overhead costs on the entire construction project reflect an unhealthy situation involving duplication between the General Electric and many of its subcontractors.

Now, Mr. Chairman, those are the general high lights of what I believe to be a highly critical report of a board set up in the Commission, that shows the unusual jump of a contract authorization which was originally around \$6,000,000, to a total completion cost for all three phases of \$25,000,000.

I believe this is true—and I am going to allege that it is my belief—that the Commission itself did not know of this great overrun, and the unusual almost quadrupling of this contract, until one of the Commissioners on a routine inspection trip early this year—and I believe it was Dr. Bacher who went out there—in the course of a routine investigation discovered this matter.

In other words, the point is, and I think it is amply proven in this report, that because of a lack of organizational set-up in the Atomic Energy Commission these matters of this tremendous overrun from \$6,000,000 to \$25,000,000 were not brought to the attention of the Commission, and that the Commission's methods of checking caused an error there in which overages of this kind can and, in fact, in this instance did occur.

I refer to this instance not as an exclusive and sole instance, but as the ones that I am talking about this morning.

I think it goes directly to the question of maladministration, of a failure of a properly organized accounting and recording method, and I do not know about—that is, I do not care to go into—the urgency of this matter. Without doubt, the installation or the results to be obtained from this installation are necessary results for the Atomic Energy Commission, but I also call your attention to the fact that in this report is a flat statement that, had there been any idea that the total costs would have gone nearly this high, instead of planning a structure which would work on a 40-hour week, one shift, without doubt they would have planned a much smaller structure that would have worked on three shifts, and been much cheaper in construction and operation.

I also want to call attention, before I finish what I have to say, Mr. Chairman, to a news release that was put out yesterday evening by the AEC. I think there is a line left out of the newspaper clipping, but I believe that it is supplemented in the mimeographed release which the Commission has placed on our desks this morning.

This news release apparently is in anticipation of this meeting this morning, and I assume, because it comes from the Commission, that it is in the way of a defense or an explanation of this phenomenal

situation, but it says as follows—it refers in general to the changes in design. Maybe changes in design were necessary. I do not raise that issue; I do not raise the issue of whether or not faulty construction or faulty anticipation is necessarily involved. The point I am raising is about the system which permits a contract of this kind to get so far out of line, an authorization originally of \$6,000,000, ending up with a potential cost now for full completion as shown in this report of \$25,000,000, but I do want to call attention to this news release in which this very important thing is said, and I quote from the mimeographed news release, because it has the full lines in it. I quote from a paragraph about in the middle of the release, and is as follows:

The validity of these costs can be judged—  
this is what the Commission is saying in its news release—  
properly only in the light of the circumstances in which they were incurred.

This is significant—

The overriding consideration was earliest possible completion of this vital installation because of its relation to the results of the 1948 Eniwetok tests. A part of it will be in production on June 27 and the remainder will be completed as rapidly as possible.

Mr. Chairman, I defy you or any member of this committee to find that this report is bottomed at all on the urgency of the Eniwetok tests. This project was conceived early in 1947. The Eniwetok tests were not held until late last spring. The results of the Eniwetok tests were not reliably available until some time last fall, so how the Commission can come today and attempt to excuse this matter on the Eniwetok tests which, of course, is excitable to everybody, when they had not even been held, and this project had gone into these multiple increases in appropriations, is beyond me.

I find no evidence that the Eniwetok test is referred to in this report as a basis for urgency, and in fact the whole construction project was carried out before the date for the Eniwetok tests had even been definitely settled; that is, the project had been started, and it was well on its way to completion.

Now, I call that to the attention of the committee.

Mr. PRICE. Mr. Chairman?

The CHAIRMAN. Mr. Price?

Mr. PRICE. I think even I could answer that, but I would like Mr. Lilienthal to answer that.

Mr. LILIENTHAL. I hate to keep on pulling rugs out from under the Senator, and this is obviously going to take some care in statement because of security.

The Eniwetok tests had in mind the testing of new designs of atomic weapons. This design affected the fabrication of the nuclear component of weapons in order that they might be improved.

The plans of the Commission's staff and its Los Alamos Laboratory had advanced to the point where a long time before the tests were held, a very considerable time before the tests were held, there was a very good reason to believe that the tests would be successful, although they were rather daring in the design.

In order to take advantage of the test results and do so promptly—that is to say, to redesign and refabricate weapons based upon the results of the tests of these new models—the Commission had to be

ready as far in advance as possible with facilities for the refabrication of the nuclear components.

To await the results of the tests before beginning the design and construction of these new production facilities dealing with plutonium, a most difficult and highly poisonous material with operators—there was a very great urgency in the design and pressing forward with this facility.

It may seem to the Senator, as it might seem to me, might have seemed to me as a layman, that we would wait until after the tests before we took advantage of the tests. But on further reflection, and without going into any more details in open, details with respect to that operation, although the details have been presented to this committee in a closed session, it is perfectly evident that if we were to take the earliest possible advantage of the results of new designs of the nuclear components of weapons, this project, long before the tests were held, had to be under way and pressed forward.

I would like to say, if I may, about the Senator's remark that he does not care to go into the urgency—and, I gather from earlier remarks, nor into the results—of this facility—

Senator HICKENLOOPER. Before you get into that, Mr. Lilienthal, if I may, Mr. Chairman, I would like to just clear the record on one further point about this—at least to me—new philosophy of the Eniwetok test influence.

I will call your attention and that of the committee to the introductory or to the administrative history of this matter as set out by this Board, and I will read as follows:

In the middle of 1946—

that was before the Commission was even established—

the Manhattan Engineer District first approached the General Electric Co. regarding the installation and operation at Hanford of—

this type of facility. I will not mention the symbolic type of facility.

In August representatives of the General Electric management visited the plant at Los Alamos to inspect the facilities there. Various trips of this kind have been made since that time. On one of the earliest made in November 1946, by Mr. Winne and Dr. Suits, accompanied by Mr. Williams of the Atomic Energy Commission, it was decided that a plant of this kind should be constructed at Hanford.

This is in 1946, according to this report, before the Commission had ever been set up, and even before the Eniwetok tests were more than a gleam in somebody's scientific eye.

Mr. LILIENTHAL. Let me respond to that.

Senator HICKENLOOPER. I would just read the rest of it, the rest of this paragraph:

In December 1946, an intensive study of the Los Alamos facilities was made by a working group from Hanford works, and a feasibility report was issued early in the following year. A preliminary design was started in September 1947.

This project, apparently, was born and decided upon in the Manhattan District before the Commission ever took over. This is from the Commission's own report, of its own Board; and that is on page 2 of this report, Mr. Chairman.

Mr. LILIENTHAL. May I respond to that?

The CHAIRMAN. Yes, Mr. Lilienthal.

Mr. LILIENTHAL. The activities for which this facility was designed and built relating to the certain matters in connection with

plutonium, including its fabrication, had been carried on at Los Alamos largely by scientists. It was clear in the Manhattan District days, as borne out by the decision of the Manhattan District in respect to its removal from that place, that both for security reasons—that is to say the concentration of too many crucial matters at Los Alamos, and because it was unsound to continue operating a production line with scientists and technicians—that another facility should be built, which could be operated by those who were characteristically production men, which required a completely different kind of design, although the purpose of the plant would be the same as the one at Los Alamos, where the first fabrication took place.

There was also this question of dispersion, and it was the conclusion of the Manhattan District that Hanford was the best location, as the Senator has indicated, before this Commission was created—and that this facility at some time and as early as possible, for both of these reasons, should be redesigned and built as a production facility rather than as a kind of breadboard scientist-technician-operated facility at a place where there was already too great a concentration of vital production activities, vital activities.

Now, this relation to the question of the change of its location and the change of its characteristics, the question that the Senator has raised, relates to our urgency. The urgency was greatly increased as soon as it was decided—and gleams in the scientists' eyes had a lot to do with it—as soon as it was clear that the tests of models that had been thought about, planned about, argued about among scientists at the laboratory, should be the subject of full-scale tests, which take a long time to prepare for, and as soon as it was reasonably clear that those tests would be successful, because if they were successful, a facility capable of greater output, and located in a better place, would be needed. So the decision to hold a test at all carried with it the sense of urgency about having facilities available when the tests have been completed, to proceed at once into the refabrication of the new models using the materials in the earlier model.

Mr. HOLIFIELD. A project of this scale, if I may interrupt, Mr. Chairman, is not turned on and off like turning on a water faucet and turning it off. It requires years to complete, and it requires months and months to plan; and where a change of design is indicated by the success of a revolutionary new discovery, it becomes necessary to change very complicated plans which have taken months to produce, and it may take additional months to change them to meet the new situation.

Mr. LILIENTHAL. Yes, Mr. Holifield.

Mr. HOLIFIELD. Is that not true?

Mr. LILIENTHAL. And when you bear in mind what the stakes were here as to our urgency—we put the heat on the General Electric Co., and let there be no mistake about it, we share and we are glad to share responsibility for what I believe to have been a fine piece of work. The plant is there. It is there in time to help us in increasing our stock pile, but the responsibility we had was to see that no time was lost, and to persuade the General Electric Co., in spite of all the other jobs that had been loaded on to them, to really bear down on this so that the hiatus in the refabrication and taking advantage of the results of Eniwetok should be as brief as possible, and indeed it has been.

This has been a highly successful piece of work so far as the General Electric Co. is concerned. I would like to make this general remark.

Senator HICKENLOOPER. Just a moment. With all this urgency, Mr. Schlemmer stopped work on this project in January or February—he halted the work; there was a work stoppage on all this—

Mr. LILIENTHAL. Mr. Shugg and Mr. Schlemmer and others can testify as to the facts on that. That is not an accurate statement. I respectfully suggest that it is not borne out by the facts.

Senator HICKENLOOPER. All I know is what the report said.

Mr. LILIENTHAL. If I may come back to this business about getting the whole setting of urgency and results, and this is something on which I am sure the committee will want, in all fairness, to hear at length from the General Electric Co., which has been criticized, very severely criticized, in this report of the Commission's Director of Production, General Counsel, and Controller.

I think it is a wholesome thing and not evidence of incredible mismanagement—on the contrary to have people who are so independent and so desirous of improving results that they put on their hair shirt and they criticize themselves and everybody else. This is evidence of a good, sound, healthy management; whether their criticism in the end—when the answer of the General Electric Co. is made, and other facts are presented—is borne out or not. But I am somewhat disturbed by Senator Hickenlooper's repeated suggestions about not being interested in the whole picture.

The reason I am disturbed can be illustrated best, I think, by something which happened to me in a ball park. I went to see a ball game in the days when I had time for such things, with a fellow who had a habitually rather dim outlook on life, and Ted Williams came up, and Boston was behind, and there was a very good pitcher, and he stood up there and swung around, and he missed the first ball by at least 3 feet, and it was a very awkward performance. This fellow said, "This Williams guy is lousy; he is a lousy batter. Look how awkward he is, and he missed the ball."

The second ball, Williams knocked out of the park. I said, "Well, this does not look like a lousy batter to me." "Of course, he is lousy," he said. "Did you see the way he swung and missed that first ball and the way he hit that ball over the fence? He was awkward when he did it."

Well, I would like to suggest that perhaps the test of a ball player, of a batter, and of the General Electric Co. is not how awkward they may be during the process, but whether a ball is knocked over the fence. In this case GE knocked the ball over the fence, in my opinion.

I would like to suggest that Mr. Winne and his associates be heard from, and that then we come back to some of the more—particularly the Commission's relations to this undertaking. Mr. Winne can respond to such questions about the availability of cost data, some of the general criticism in this report.

It is the business of a good organization to create a critical attitude. But it is not the way to improve the relations between the Government and a very distinguished institution of business, the General Electric Co., for us to carry this critical attitude to such an extent that we have a press conference or a big microphone out in front of the Commission building every time we criticize each other.

Nevertheless, the matter has been brought out in a public hearing; that is wholesome; we can all take it and probably profit by it, but the essential thing for members of the committee, and I think for the American public is this: This is referred to in this report from which Senator Hickenlooper read. He spoke of the Commission-wide policy of being opposed to any detailed supervision of the General Electric Co.'s work. That is a correct statement of our policy, and the reasons for it go very deep, and they are a matter, I hope, that this committee, which is familiar with this policy in such matters as labor and other matters, will weigh and reassess and that in your report you will express your opinion to the country as to its soundness.

As we see it, and we will hope to come back to this at some later stage—if not in August, at some earlier time—to the relationships, to how this job is to be done as it relates to the industrial type of operation. Our view has been from the very outset that there are two things to avoid in this very complex undertaking. That it is owned by the Government of the United States is inevitable. If there had been any alternative, I am sure the members of the special committee would certainly have recommended such an alternative. I think we are all resigned to this.

But there is an alternative to direct Government operation. This is the thing we feel strongly—I feel as strongly as anyone could—should be avoided. That the thing to do is not to have the Government operate these industrial type activities directly, but to get the best industrial talent the country can afford; which is willing to accept and to live under the conditions under which this enterprise presently lives and, perhaps, most of us live. In the General Electric Co. there is such a company.

One of the great differentials this country has over the rest of the world is in the existence of just such companies as this, and I could name a number of others, and some of them are contractors of this Commission. "Contractor" is not the word; they are partners, they are operators. "Contractor" assumes that there is a specific job, like the building of a bridge, like the building of a line of railroad or highway from A to B, something that can be begun at a certain day; when it is through you can pay for it, and that is the end of the relationship.

But here is something that is dynamic and growing if it is to be useful in a new technology, so that the word "contractor" is hardly the word.

What we are trying to do, members of the committee, is to develop a new kind of set-up in American industrial affairs which is a hybrid of public and private; and a hybrid of this kind is only good if the public does not sit on the necks of the private or the private is completely unaware of its public responsibilities.

Now, the other alternative—and this is one that is considered and apparently has had considerable thought given to it—is to pile on top of the industrial operator another set of managers, that is, that the Government should supervise in such detail that every important step taken by the industrial operator should be checked and rechecked and double checked and triple checked by a group of Government supervisors. This we do not believe is right.

I do not want to cast any reflection on the field of regulation unnecessarily, but I think to a considerable extent what has happened

to the railroad industry of this country is an example of what not to do, because in the railroad industry we have regulation carried to such detail that in many respects there is a second set of managers in the form of the regulators.

Now, perhaps, that was necessary in the case of the railroads. We want to avoid it here.

This business of having—this business of carrying this checking business so far as to squeeze out any initiative, to be so sure there shall not be any mistake by someone's measure of judgment, by the checking process, is something that we believe will kill all possibility of holding and retaining the kind of companies which the General Electric Co. has proven itself to be in this over-all job, and generally in the history of this country.

I recall that last September, early September 1948, Senator Hickenlooper made a visit to the Hanford Works, and on several occasions it was reported that he had discussed with the Commission personnel and with G. E. personnel the strength and the function of the Commission's direct employee, of the Commission's staff at Hanford. He questioned General Electric Co. staff people as to whether the Commission's staff was not actually a hindrance to the company, and whether the Commission's staff was not unnecessarily large. These are proper and appropriate and pertinent questions relating to the relations between the Commission and the General Electric Co. His questions about whether the Commission had checkers checking checkers, that the contractor already had, was just the sort of thing that we seek to avoid, and apparently he sought to avoid at that time.

It was the impression of some of the General Electric officials, and in their conversations with Senator Hickenlooper on this visit, that he had strongly implied that if it were a matter of Federal law which required the Commission to have staff checkers making detailed checks of work performed and checked by the contractor, then the Senator proposed to see to it that the law would be changed so that such a redundancy of effort and waste of money would be stopped, and if that were the case I would certainly agree with the Senator that this should be stopped, that this would be a waste of money, that this would drive out the initiative of such contractors as the General Electric Co., and I do not believe it requires a change of law, and I believe the Commission's policy is consistent with it.

This does not mean that the Commission should not encourage the kind of self-criticism and the criticism of its contractors contained in the Williams-Green-Fisher report, and that we will not continue even though we know that these reports are going to be made public, although I think the difficulty of operating with a great industrial concern when such reports are made public that are not intended for that purpose, is evident.

We will continue to encourage such frank and candid and independent critical report.

As I say, Mr. Winne, whose company is directly concerned in this, is here with his colleagues, including Mr. Prout, the actual manager for the General Electric Co. at Hanford, as are Mr. Williams and Mr. Schlemmer and others concerned in this matter.

Senator HICKENLOOPER. Just to clear the record at this time, Mr. Chairman, I want to call attention to the fact that whatever criticism may be directed at the General Electric Co., I have not directed at the

General Electric Co. I have raised no issue of criticism of the General Electric Co. on my own personal belief. If there has been criticism it has been directed at the company by the Commission.

Secondly, with reference to the intense pushing of the General Electric Co. by the Commission in this matter, I again, for the record, want to read now the statement in the Commission's own board's report as follows:

On February 23, 1949, Mr. Schlemmer—

who is the General Manager at Hanford—

wrote to Mr. Prout disapproving the requested authorization for additional expenditures. In this letter Mr. Schlemmer requested immediate cessation of all work involving costs to the AEC not essential to phase 1, stopping of all overtime beyond the present 6-day week, a detailed statement of expenditures through February 15, 1949, and a review of the entire 234-5 program.

And I think I am still standing on the rug.

Mr. LILIENTHAL. Well, Senator, I think if there is an explanation of what phase 1 is, you will see that the rug has disappeared. I do not want to be disrespectful. What I mean is that phase 1 allows operation of that line.

Senator HICKENLOOPER. It is a three-phase operation, phase 1, phase 2, phase 3. It is the completion of three phases, according to this report, which would cost \$25,000,000.

Mr. LILIENTHAL. But the completion of phase 1 permits the operation of a completed unit of the operation, and this will be explained in more detail later. It perhaps is not clear enough in this report; it is obviously not clear.

Mr. ELSTON. Mr. Chairman?

The CHAIRMAN. Mr. Elston?

Mr. ELSTON. Mr. Lilienthal, you had full opportunity to offer the same defense that you are offering this morning to the committee that made the report to which Senator Hickenlooper has referred, did you not?

Mr. LILIENTHAL. Senator Hickenlooper referred to the House subcommittee, and this question, as far as I recall, was not discussed before the House committee.

Mr. ELSTON. No, I am referring to the report of the three persons from your own organization—

Mr. LILIENTHAL. Oh, no.

Mr. ELSTON (continuing). Who made an investigation.

Mr. LILIENTHAL. No, this report—that was not made clear, Mr. Elston, and I am glad to have a chance to make it clear—this report was transmitted to the General Manager and the Commission by this group sent out by the General Manager. It was also dispatched to the General Electric Co. for their comments and a report. They have a report which has also been amended so as to be declassifiable, which is in response to these criticisms.

They have not yet completed their report of response to the criticism, so that what you have in a sense is not a report: it is not a complete report, but a brief to which response has not yet been made, and the General Electric Co. today will make response to these criticisms.

Mr. ELSTON. Well, you had an opportunity to see the report of the investigating committee before it was filed, did you not?

Mr. LILIENTHAL. No I did not. That is not the way we operate. In order to maintain the independence of staff members they present

their views without any argument with the Commissioners or anyone else as to whether they are sound or not. That is why I say this is an internal report. If this report had been prepared for public presentation, there would have been the report, the critical report; there would have been G. E.'s response, and there would have been the conclusions of the Commission as to whether it was correct or not.

Mr. ELSTON. Do you contend that this report is not a complete report?

Mr. LILIENTHAL. I do not contend it. I simply say it was intended to be a complete report.

Mr. ELSTON. How do you account for the fact that your statement here this morning about the entire transaction is not included in the report of your own three investigators?

Mr. LILIENTHAL. Because these men were making an internal report. They were making a report to people who had available to them the whole circumstances, and it was, therefore, no point in putting it into the report. For them to have repeated the whole set of circumstances in a report directed toward a defect, as they believed, and as we all believed, the defect requiring improvement, would have been redundant in the extreme, Mr. Elston.

Mr. ELSTON. Did they not have the same opportunity to inquire into all the facts that you have had?

Mr. LILIENTHAL. Yes, of course.

Mr. ELSTON. Yet there is nothing in that report about any Eniwetok tests.

Mr. LILIENTHAL. Well, they knew the purpose of the report, and Mr. Williams, for example, who can make it perfectly clear, that he was fully aware of the relation to the Eniwetok tests.

Mr. ELSTON. And hearing your explanation and hearing the report of Senator Hickenlooper, as he read it, they seem to be quite different. How do you account for the difference?

Mr. LILIENTHAL. Well, my comments were not a report, Mr. Elston. My comments related to the setting in which this report should be reviewed, and there are people here who can provide that setting. It was not put into this report because that was not the assignment given to these men. This whole context of the facts are known, and there was no point in making a book out of a report.

Mr. ELSTON. The assignment given to them was to determine why the estimate had gone from a few million dollars up to more than \$25,000,000 for this particular project, was it not?

Mr. LILIENTHAL. Yes, Mr. Elston. I am sure that after you have heard Mr. Winne for 10 minutes the questions you have put to me as to the character of the report will be made plain.

Mr. ELSTON. Well, did he have an opportunity to make a statement to the investigators?

Mr. LILIENTHAL. No. This report was supplied as a basis for further discussion, and the response of the General Electric Co. has not yet been made, and that is why I hope you can have it here.

These are simply the criticisms. Now, the company, in all fairness, should be heard to make its response. The report of the three men who went out to Hanford was not intended to be a final report. It was intended to raise questions of defects to which response would be made by the General Electric Co. and by others in the organization. This is the sort of thing that goes on all the time in a well-managed

organization. The final report will then report the joint judgment of everyone having heard all sides.

Mr. ELSTON. When was the final report to have been made?

Mr. LILIENTHAL. I do not know the answer to that, but it can be made—we can get General Electric Co.'s views simply by listening to Mr. Winne at this juncture.

Mr. ELSTON. Was any investigation in progress after that report was filed?

Mr. LILIENTHAL. A good deal of continuing study has been made since that time.

Mr. ELSTON. Who was making that investigation?

Mr. LILIENTHAL. Well, I would not call it an investigation, but the General Electric Co. has put men to work on figures and facts, and has prepared a report which has been made available to you which, I believe, in its present form is unclassified. There is a good deal of further work which has been done. It is not contained in this first report because that was not the purpose of the first report.

Mr. ELSTON. I notice you say in your release, your press release, that "plutonium is a deadly material."

Was it any more deadly after the estimate got up to \$25,000,000 than it was when the first estimate was given?

Mr. LILIENTHAL. Mr. Elston, if you want some information about this subject, there is a man here, Mr. Winne, of the General Electric Co., whose company has been publicly severely criticized in an internal report. It would seem to me a matter of fairness to permit him to answer that question and some other questions of the same character.

Mr. ELSTON. It so happens that he did not put out this press release; you put it out.

Mr. LILIENTHAL. It is a joint press release, Mr. Elston, by the General Electric Co. and the Commission jointly.

Mr. ELSTON. Well, it is headed "United States Atomic Energy Commission," and I see no reference to the General Electric Co., except as you express some position of the General Electric Co.

Mr. LILIENTHAL. The second sentence in the press release states:

The Commission and the General Electric Co. feel that the facts pertinent to a consideration of the statement should at once be made public.

This is a joint press release.

Mr. ELSTON. Yes, but you are simply repeating what the General Electric Co. feels. This is not a report that the General Electric Co. made. This is the Atomic Energy Commission's report.

Mr. LILIENTHAL. If we are talking about the release still, this is a joint statement.

Mr. ELSTON. All right.

To get back to my question which you have not answered, was plutonium any more deadly after the estimate got up to \$25,000,000 than it was when the original estimate of three-million-something was made?

Mr. LILIENTHAL. Plutonium was no more deadly with the measures that had been taken and the fuller understanding of how to protect the employees of the General Electric Co. who were going to operate this plant—that knowledge had increased, and if and when you will permit Mr. Winne to respond, he will explain the technical reasons why the estimates were revised upward, in order to take into account

the increased knowledge of the deadliness of plutonium to workers having to fabricate it.

Mr. ELSTON. All right, Mr. Chairman.

The CHAIRMAN. Now, Mr. Winne, you have some comments on this matter?

**STATEMENT OF H. A. WINNE, VICE PRESIDENT IN CHARGE OF  
ENGINEERING, GENERAL ELECTRIC CO., SCHENECTADY, N. Y.**

Mr. WINNE. Yes, Mr. Chairman. I would like to comment in general on this particular construction job, and on the whole project, to some extent.

Senator HICKENLOOPER. Mr. Chairman, I would like to ask Mr. Winne a question.

When did you first see the report of this Williams' board? When was it sent to General Electric?

Mr. JACKSON. Before that, could we have him qualify for the record?

The CHAIRMAN. Yes. He is vice president of the General Electric Co.

Mr. WINNE. General Electric Co.

The CHAIRMAN. In charge of?

Mr. WINNE. Engineering policy, and chairman of our so-called nucleonics committee.

The report was sent to me by Mr. Wilson, received by me or by my office—I did not happen to be there at the time, so that I did not actually see the report personally until the first of this week, but it was received in my office on June 7. Mr. Prout had a copy of it—when?

Mr. PROUT. Friday before that.

Senator HICKENLOOPER. The date of this report is May 6, 1949, so that this report had been made apparently to the Commission a month before it had been sent to our office.

Mr. PROUT. Friday, June 3.

Mr. WINNE. You had it on Friday, June 3. But we had previously to the receipt of the report met with members of the Commission staff, and Messrs. Fisher, Green, and Williams, and discussed in general with them their investigation, but we had not at that time seen the actual report. As I say, these are the dates on which we did receive it.

Perhaps I should give just a little background since something was mentioned about personnel changes in the company, and so forth.

Going back to the fact when we took on this contract for the Manhattan District, in May of 1946, the contract embodied two main parts. One was the operation and the construction of some additions to the Hanford Works. The other was the construction and operation of a laboratory in the vicinity of Schenectady to be used for the development of power from atomic energy to be known as the Knolls Atomic Power Laboratory.

Mr. Wilson, our president, was and is very deeply interested in this whole project, and at that time he established a company nucleonics committee, consisting of myself as chairman; Dr. Zay Jeffries, vice president in charge of our chemical department; and Dr. Guy Suits, in charge of our research laboratory.

Later there was added to it Mr. David Prince, vice president in charge of our general engineering and consulting laboratory, and

that group has been acting continuously as more or less of a board of directors for our operation under this contract since we entered into it initially and is still functioning as such.

At the start of the operation, of our operation of the Hanford Works, there was envisaged the operation, plus the development and construction of some additional chemical facilities. In considering how to set up and operate we decided to place the Hanford Works under the general supervision of our chemical department, with Dr. Jeffries, then vice president and general manager of it, and his immediate assistants at that time, Mr. W. H. Milton, now vice president of our company, located in Washington, to set up the initial organization out there, which was composed very largely of the organization which we took over from du Pont, plus a considerable number of our own people in the administrative and technical sections.

We then appointed—Dr. Jeffries did—Mr. D. H. Lauder as manager of the Hanford Works.

Along in 1947 it became apparent that a much larger construction program was going to be necessary than involved in the new chemical plant, and in the latter part of 1947, after a lot of discussions among ourselves and with the Commission, the company decided to set up the operation of the Hanford Works as a separate department; that is, our company now consist of nine decentralized operating departments, one of which is the nucleonics department which is now responsible for the operation of the Hanford Works, and the general administration of our activity under our contract with the Commission.

At that time, as an interim measure, and we all knew it was an interim measure, Mr. Wilson appointed Mr. Roy C. Muir, who had just retired as vice president and general manager of our very largest department, the apparatus department, as vice president and general manager of the nucleonics department, in order to give time to make the necessary shift in our entire organization so that we could make available for that job the man who Mr. Muir and Mr. Wilson and those of us on the committee wanted to get to operate the plant, who was Mr. George R. Prout, who is now vice president and general manager of the nucleonics department, and was formerly vice president and general manager of our air-conditioning department.

I say that simply to explain some of the personnel changes, but also to show that there has been a continuous over-all direction, the group comprising this nucleonics committee.

Now, the construction job at Hanford has embodied a great deal more than this 234-5 project, although it in itself is quite a large project. But just to illustrate the magnitude of the construction operations which we have carried on, and I feel very successfully, at Hanford, I would like to give these figures.

From July 1, 1947, until April 30, 1949, there are approximately 65 what might be termed major construction projects which have been initiated, and many of which have been completed, and all of which are nearing completion. Those total 65 projects, our initial estimate of the costs, was a total of \$230,602,000.

As I say, many of the projects have been completed, and all of them are nearing completion, and the present indicated actual completion cost will be \$237,162,000, or an overrun of approximately 3 percent,

and included in there is this 234-5 project on which the overrun in percentage was quite sizable.

Now, to get to this 234-5 project: This facility, as may have been made clear—

The CHAIRMAN. If you deduct the overrun on the 234-5, do you know what the percentage of overrun would be?

Mr. WINNE. There would be no overrun. We would be under the estimate if we deduct, because, you see, we are over less than \$7,000,000, including the jump from the initial estimate, formal estimate of \$8,760,000 on 234-5, to \$24,950,000.

The CHAIRMAN. It would be about 12 million under?

Mr. WINNE. So that if we subtracted that project, it would take out an overrun of roughly \$16,000,000, and we would then be 8 or 9 million dollars under the estimated cost of the total of what would then be 64 projects, Senator.

Now, this 234-5 facility is a facility for the final refining and fabrication of plutonium metal. Plutonium metal is not only the material which has been used in some of the bombs, but in itself it is an extremely poisonous material. It is one of the most deadly poisons known to man.

The small particles of dust can be extremely dangerous, and to show you some of the conditions which we had to meet in the design of this facility, and to emphasize the point which was brought out by Mr. Elston, that at least our knowledge of the dangerous nature of plutonium has increased, as the cost of the facility increased; when the design on this building was started, it was believed that there could be permitted a concentration of plutonium dust in the air, and this is not a very heavy concentration, of about one part in two and one-half trillion parts of air.

Now, to offer a margin of safety, and it may seem that we put in an overadequate margin of safety, but later results have proved that it was no more than adequate because we have a pretty conservative staff of health physics people at Hanford, of whom we are very proud—we think they are the best in the country—the plant was actually designed so that the normal concentration would certainly not exceed one part in fifty trillion, and later results have proved that that is none too safe. Actually we are going to be able to get, with the equipment that we have installed, down to about as low as one part in one hundred trillion, and that is the amount that is today considered by the best authorities to be a safe margin, so that had we not of our own accord put in the additional factor of safety, above the value which was thought safe at the time we started this design, we might have on our hands today a plant which we would have to start in to rebuild, and at a cost probably in excess of \$25,000,000.

Now, it is true, as Senator Hickenlooper brought out, that we began first to consider this project in August 1946. The Manhattan District—

Senator HICKENLOOPER. Before you proceed, Mr. Winne, with reference to these very careful precautions that you must take, as a layman I am roughly aware of them; I have been out there and I know something about them, but I would like to call your attention to this statement in this report when we get into the matter of extensive costs.

On page 4 of the report, this board says this:

It appears that the project has been worked up on the basis of—  
a certain capacity, I will not mention the exact capacity—

on a single-shift 40-hour week. Although it appears that there are both security and technical reasons for this decision, a plant of smaller capacity operating on a three-shift basis might have been feasible and would have been given consideration by the Operations Division, AEC, Hanford, had they had any indication that the \$6,350,000 estimate was too low.

That goes to the point of whether or not it is a safe situation or a financial disruption.

Mr. WINNE. Well, I think we should be careful not to confuse two things, and those are actual production capacity of the plant and safety conditions in the plant.

Now, the safety conditions have to be met whether you are turning out a teaspoonful or a ton of the stuff a day. You still must meet the same over-all safety conditions.

Now, insofar as the actual capacity of the plant is concerned, again subsequent events with the increasing production capacity of the Hanford works, assuming, of course, that that capacity continues to be necessary, which I do not know whether it will be for weapons or not, but in any case if it is not needed for weapons, the same material which we are producing there can also be used in power reactors, that is power piles, producing heat, to be used, in turn, in the production of electric power or for other purposes. So that I feel that this plant has use even far beyond the weapon project alone, because it is so laid out that it can be used to form special parts which might be needed in the production of power piles and that sort of thing, so that it is a pretty complete facility, and actually the matter of capacity in the terms that we are talking about there, that is, we do not ship material out of Hanford in carloads per day, of course, as you well know, and the physical size of the plant and the physical size of the facilities in it could have been decreased very little even had we attempted to lay it out on a three-shift basis rather than a one-shift basis. Probably some saving in cost could be made, but—

Mr. JACKSON. Mr. Chairman, might I interrupt the witness just to ask one or two questions in the way of introduction?

Doctor, I wonder if you would state whether or not a building of this kind has ever been built before.

Mr. WINNE. Well, I think certainly none exactly like this. Now, there is a facility in operation at Los Alamos for turning out certain plutonium metal parts that has been operating since—well, since the first bombs were produced, in the early stages of the project.

Mr. JACKSON. Is this an ordinary building construction job?

Mr. WINNE. Insofar as the building itself is concerned, it is not ordinary, but it is not too unusual. It is the facilities within the building, it is the provision for tremendous amounts of ventilation, the provision for filtering, not only the incoming air but especially the outgoing air because we have to protect not only the workers in this building, but all the people and the animals in the surrounding countryside.

Mr. JACKSON. Doctor, I am speaking, of course, of the entire structure.

Mr. WINNE. Yes. The entire facility is different from anything that has ever been built before. There is no question about that. As far as the actual physical building and its walls and doors, it even is somewhat different because of the provision for ready decontamination in case any rooms gets contaminated or anything like that; and the provision of means for preventing dust collecting there or that sort of thing.

But as a structure, the building itself is not extremely special, you might say. It is quite special but not extremely special.

Mr. JACKSON. This type of plant has never been built before?

Mr. WINNE. It is wrong to think of this installation as a building. It is a complete facility involving not only the building but all the things in it, the ventilating equipment outside of it, the tremendous, big, high stack outside of it, great quantities of air filters, and so forth, and remote manipulating equipment, so that operators do not have to touch the material which is being handled, have no possibility to breathe it; walls separating them from any possibility of contamination; zones which can be decontaminated for repair of equipment, and many things like that, which make it an extremely special facility.

Mr. JACKSON. What portion of the costs are involved in ordinary building materials, and what portion of the total costs were involved in the unique type of equipment and facilities that go into the building?

Mr. WINNE. I do not know that I can answer it offhand.

Mr. JACKSON. Approximately?

Mr. WINNE. I am just talking to Mr. Baker, the Comptroller of our Nucleonics Department; he can get together some figures on that for submission at a later date, if you want it, but I do not have it broken down in detail now.

Mr. JACKSON. Submit it for the record.

Mr. WINNE. Is that all right?

Mr. JACKSON. Yes.

(The information referred to is marked "Exhibit 15" and will be found in the appendix.)

Mr. WINNE. Well, as I say, we started to discuss this project with the Manhattan District, or rather they did with us in the summer of 1946.

At that time the reasons given for desiring to install such a facility at Hanford were that they wanted to get it under the general aegis of a production operation instead of a laboratory; that it seemed desirable that Hanford should complete the fabrication of the plutonium metal rather than to ship its products to Los Alamos, and also it would have duplicate facilities in case anything happened either within or by enemy action at Los Alamos.

Well, at that time we told—in August, I think it was, in 1946, several of us visited Los Alamos, looked over this facility in operation at Los Alamos, and told the Manhattan District that we agreed with them that there was some reason for putting an installation at Hanford, but that we felt we could not embark upon it at all full-speed at that time because we were taking, just taking over the operation of the plant, and we were also getting into the development and design of this new chemical separations process. But we continued to study

the matter and, as was brought out, I think, in the report in December 1946, we sent some of our people there again, some of our technical people from Hanford, to look over the facility, and in February 1947 we formed a so-called feasibility committee to study the design and production of a plutonium fabrication plant at Hanford.

In July that feasibility study—July 1947—was concluded, and in September 1947 a project proposal was prepared.

Now, at that time we had no design for the plant whatsoever. We did not even know what size the buildings would be. They were, perhaps, not gleams in a scientist's eyes, but it was a gleam in the eye of our design and constructions divisions, perhaps, and in September of 1947 we submitted to the AEC this project proposal in the amount of \$6,350,000. That went through some modifications, resulting in the figure of \$6,255,000. It really could not be dignified by the name of an estimate; it was more of what we would term a "horseback guess," really, because we did not have design information; even complete process information. We had not determined fully what process we would use and, therefore, that was just more or less a guess at what the order of magnitude might be.

As it turned out it was not even very good as a guess of the order of magnitude, but it was the best that we could offer under the circumstances.

Then, in February 1948, I believe it was, when the AEC began to put the real pressure on us to get this job going and get it going fast, I think that was about the time you began to see the need for this from the projected or about-to-be-done tests at Eniwetok; is that not correct?

Mr. LILIENTHAL. That is correct.

Mr. WINNE. That is when we began to get the real pressure on us to shove the design ahead, and it was then that we began to get the subcontractors into the project, the Giffels & Valet Co., a very reputable firm, as architectural engineers.

Of course, we had to do in our own organization a large part of the design of the very special handling equipment, especially that equipment which was involved in the so-called remotely operated mechanized line.

In July of 1948 we, at the request of the AEC, submitted a new project estimate which was on the order of \$8,900,000. Again, even at the time of making that estimate, there was no completed design, hardly even the start of design which was available.

Senator HICKENLOOPER. Dr. Winne, may I read you a statement from the report of the committee with respect to that estimate? I am quoting from the report:

This cost estimate by Mr. Prout was confirmed on July 12, 1948, by a letter from Mr. Muir—

who was your operating manager there—

at the request of Mr. Shugg, who had insisted upon assurance that the cost estimate was accurate. In this letter Mr. Muir referred to the net estimate of \$8,239,059, and stated: "This estimate has been very carefully made, and we have every reason to believe that, barring unforeseen difficulties, the project can be completed as outlined within the amount estimated."

I mean, that is an indication to me at least from the report that it was not a "lick and a promise" estimate at all. It was an estimate arrived at through very careful consideration.

Mr. WINNE. That was Mr. Muir's understanding at the time. Subsequent review of the project has brought out the fact that even at that date there were not design drawings and data available on which to make an accurate estimate, and there were many changes which had to be made in what was then contemplated as the scope of the job as we went along in order to accomplish the necessary amount of safety and security, in order to provide for the ventilating equipment which had to be increased many times above that which was contemplated in that initial estimate, and changes in the remote operating equipment, which was truly only a gleam in our laboratory people's eyes at that time, and had to be revised as we went along and learned more about the job.

So that that estimate as made at that time was not an estimate based on anywhere nearly completed drawings. We feel that as a general rule you cannot make an accurate estimate unless your design is at least on the order of 75 percent or so complete. There was nowhere near that stage of completion at that time, but the urgency was being emphasized all the while by everybody.

We thoroughly understood that the job had to be done, that it had to go ahead, and, while no one was overlooking costs or squandering money or anything like that, still there was very definitely the feeling in our organization that this job had to go ahead and get through as nearly as possible on time, even if it did considerably exceed the initial estimate.

Our understanding of the urgency was that it was extremely great, and that persisted throughout the entire construction of the project. Many times, a good deal of the time construction, as you might say, was almost ahead of the design in an effort to get the project completed just as soon as possible and have a thoroughly adequate project.

Now, the project is completed, insofar as phase 1 is concerned. It is now going into operation. We believe it is a thoroughly adequate but not overadequate facility. We believe it is a facility which can be operated safely. We will not ask our people to take undue hazards. It is always a policy and has always been the policy of our company to make our operations safe. We have never paid what is known as a hazard pay. We will make the operation safe rather than to ask a man to do an operation for which he feels extra pay is justified, and that is the principle which has guided us in the design and construction of this facility. We think it is a good facility. We think it is a facility which is worth what it has cost, and that it was done in a very short time from the time that actual work was started.

The CHAIRMAN. Senator Hickenlooper?

Mr. ELSTON. Mr. Chairman.

The CHAIRMAN. Mr. Elston?

Mr. ELSTON. Dr. Winne, when the first estimate was given was it not known at that time that this was rather an urgent project?

Mr. WINNE. When the first estimate of \$6,000,000—that was in August of 1947. It was known that the project was wanted as quickly as possible, but there was not the urgency on it in our mind at that time that became apparent in the early part of 1948.

Mr. ELSTON. What time was fixed in the very beginning as a completion date?

Mr. WINNE. I think I have that here; just a moment. I have not the figure right here. Mr. Shugg tells me that it was scheduled to

start operation July 1, 1949, to be completed sometime later. That was at the time of this initial estimate of September 1947. Maybe Mr. Baker can locate it in his file here. It was in February 1948, the Commission emphasized the urgent need for having a production line ready for operation by January 1949.

In the Williams-Fisher-Green report there is an estimate that at the time of this \$6,250,000 estimate, the time schedule contemplated the completion of construction by April 1, 1949, the initial production started—

Mr. ELSTON. When was it actually—

Mr. WINNE. Wait a minute. I do not know exactly what that means:

contemplated the completion of construction by April 1949. The initial production started by July 1, 1949, and substantial completion by January 1, 1950, and full production by March 1, 1950.

Mr. ELSTON. Now, how much has it been speeded up ahead of that estimate?

Mr. WINNE. We will be in production this month. Will we be in full production in July? We expect to be in full production by July.

Mr. ELSTON. And how far did you miss that April date, the original April date, 1949?

Mr. WINNE. Well, the April date was specified as the completion of construction—I suppose substantial completion of construction—but we would not start production until July 1, 1949, and full production by March 1, 1950.

Mr. ELSTON. When was construction completed?

Mr. WINNE. Oh, when would you say, Mr. Prout? Along in May, Mr. Prout tells me, Mr. Elston.

Mr. ELSTON. Let us get it right. The original estimate was based on completion of construction in April 1949?

Mr. WINNE. Yes.

Mr. ELSTON. And actually—

Mr. WINNE. It is so stated here, at least.

Mr. ELSTON. Actually construction was not completed until May 1949.

Mr. WINNE. Well, it depends on what you mean by "construction," of course. I am not sure just what was meant by this "schedule of completion of construction by April 1, 1949, with initial production starting up, not coming on until July 1, 1949."

You see, we have considerably collapsed the time between what we term "the substantial completion of the construction and the getting into full production."

Mr. ELSTON. So, you do not know what that means in the report?

Mr. WINNE. I cannot tell you exactly what was contemplated in this particular estimate, Mr. Elston, except from the wording here.

Mr. ELSTON. Actually you say that the building construction program was completed in May. Now, if they were referring in the Williams' report to actual construction being completed in April 1949, what else could they be referring to?

Mr. WINNE. Well, they were presumably referring to construction, physical construction of the facility being substantially completed by April 1, 1949, ready for our production people to move in and get cleaned up and ready to start initial stuff through the facility by July 1, 1949.

Mr. ELSTON. And actually that type of construction was not completed until May 1949?

Mr. WINNE. Well, that is substantially correct insofar as the dates are concerned, Mr. Elston.

Mr. Prout tells me, informs me, that—and it is quite evident, of course, when you look at the \$6,350,000 estimate—the facility which was contemplated to be completed by April 1, 1949, was not anywhere nearly so complicated and complex as the one which actually proved to be necessary, and which was substantially completed in May of 1949. Here is a facility which was initially estimated, as has been thoroughly emphasized here, to cost around \$6,350,000, and which will cost several times that, and is completed about a month later, and will be in full production several months earlier, 6 months or so earlier, than was contemplated at the time that estimate was made.

The CHAIRMAN. Are there any other questions?

Senator HICKENLOOPER. I may just again state, Mr. Chairman, that I do not care to pursue this matter of design change, and things of that kind, with Dr. Winne. I know nothing about engineering nor of the requirements.

I again say that my criticism of engineering operations, that is another story. I am criticizing administrative procedures in a big operation of this sort, so far as over-all supervision is concerned and, therefore, I have no questions to ask Dr. Winne.

Mr. WINNE. If I may comment just a moment on that, Senator?

The CHAIRMAN. Yes, Dr. Winne. Go ahead.

Mr. WINNE. The system of cost estimating and cost control on a project of this nature is a sort of a complex thing to keep under control at all times, and the urgency of the problem has a considerable bearing on how well you can actually keep account of it.

Now, at the time this job was going on, bear in mind that we were also in the throes of completing additional major production facilities at Hanford as well as a great many houses and other facilities in the whole operation.

We were doing all that we could, all that we felt we could, at least, in the way of cost reports and so forth.

We, perhaps, could have had a lot more cost people on the job, the Commission, perhaps, could have had a lot more cost and accounting people checking up on us, although we usually feel that we get plenty of checking from the Commission and that more certainly would not be justified; that is, we have to take the responsibility for giving the Commission these figures and estimates as we go along, and we do not expect them to go into great detail in analyzing such figures as we give to them, so that we have to accept the onus for not advising them sooner of the way that this project looked that it was going in the way of overrun, although we were reporting monthly, about a month late, as to expenditures as they were going along and as to percentage of completion, from which it was evident along in the fall of 1948 that the project would be considerably overrun.

But again we cannot create in this room the atmosphere of urgency that surrounded the whole construction job at Hanford, and especially this particular job at that time. The effort was to get the job done and get a job that would work, and we have done that.

The CHAIRMAN. Well, Doctor, I just want to say in all fairness to the company and to the Commission: Certainly there is no allegation

here of any dishonesty; there is no allegation here, as I understand it, of any misfeasance on the part of the company.

The allegation that Senator Hickenlooper has made, as I understand it, is that this overrun was made without the knowledge of the Commission. I am very happy to know that in your opinion—and for your opinion I have a very high regard, because I remember with a good deal of pleasure the testimony that you gave and which helped us when we were writing this act.

I also remember your participation on the committee, the Acheson-Lilienthal Committee, that brought forward our magnificent international proposals. It is good to know that it is done and it is going to work.

I have in mind during the war there was no criticism certainly of it; it could not have been anticipated, but you remember we built the thermal-diffusion plant at Oak Ridge which cost, I believe, almost \$100,000,000, and it ran a week and we tore it down. That was just one of the necessary operations we hoped would be fruitful, but it was not.

I make this statement simply in fairness to the company and to the Commission. I understand that the Senator's charge on the matter is of a limited nature as to the fact that the Commission was not aware of the overrun while it was going on.

Mr. WINNE. Well, I appreciate that very much, Senator.

Would you care for any comment on the general operations at Hanford? We are quite proud of the job which has been accomplished on the operations.

The CHAIRMAN. It may be, Doctor, that this may become pertinent, and we will be glad to hear from you on a future occasion during these hearings. We will hear from you if it is pertinent. Right at this time it is 1 o'clock. We have announced a policy that 1 o'clock we quit.

Mr. WINNE. I see.

The CHAIRMAN. So, with this, if there are no further questions, the committee will recess until tomorrow morning at 10:30, when we will take up, as I understand it, the matter of the Chicago costs.

Mr. LILIENTHAL. Senator, may I just say this? The question of whether the Commission knew of these costs is related to whether the company knew of these costs at the time. I think that the comment on that would clear this whole record in that respect.

Mr. WINNE. Well, as I pointed out in reference to Mr. Muir's letter in connection with the estimate of July 9, at that time he was not aware that the job was going to overrun. He felt that it was a fair estimate. The matter of the overrun, the probably large overrun, did not come to the attention of our top operating people at Hanford until along, let us say, the latter part of the fall, along in the latter part of the fall.

Now, you may say that we should have had a set-up such that it could not happen. There would be that much delay, but it did happen, and, as I say, it is impossible to create in this room the atmosphere under which these jobs had to be done there to get them done in the time they did—the new production facilities and all, which were much larger jobs than this one was, of course, and which were completed in very short time, and well within the estimated costs, which com-

pare very favorably, in our estimation, with the costs and times involved in the construction of the initial facilities.

The CHAIRMAN. Your point is that if it was not known that you bear a good deal of the onus for not knowing about it.

Mr. WINNE. We bear that onus.

The CHAIRMAN. And, therefore, not notifying the Commission; is that your point?

Mr. WINNE. That is right; yes, sir.

Senator VANDENBERG. May I inquire?

The CHAIRMAN. Certainly.

Senator VANDENBERG. Dr. Winne, I am not clear on just one point. First, may I ask you: This is a cost-plus contract?

Mr. WINNE. Yes, it is, Senator Vandenberg. Cost plus one dollar, for the life of the contract.

Senator VANDENBERG. That is hardly a cost-plus contract in the ordinary phraseology; is it?

Mr. WINNE. No; it is not; and that is one reason for the terms of this contract. It is a contract in which the General Electric Co. is guaranteed against loss, but it is also guaranteed against profits.

If I may take just a minute, Mr. Chairman, I would like to bring out one point which has apparently caused considerable confusion in the minds of various people who have thought of this contract, and that is: There is embodied in the contract a provision that we shall receive from the Government a monthly payment of \$200,000.

Now, that many times has been termed an administrative fee, and has been considered by numbers of people as a profit to the General Electric Co.

In the first place, it is not an administrative fee. It is an administrative fund against which we are permitted to make such charges as we can justify as actual expenditures on our part; that is, it is to reimburse us for administrative expenses applicable to the contract operations which are not directly reimbursed at either Hanford or the Knolls Laboratory, and to serve as an indemnity fund to implement the hold-harmless clause of the contract which specifies that all costs applicable to the contract are to be recouped by us.

Now, this is a very important part of this which is overlooked by apparently many people in considering it. Under the terms of the contract we are accountable for the amount of the payment and must return and shall return to the Government any excess of receipts over the applicable costs and expenses, and our accounting must be certified by a firm of independent public accountants satisfactory to the Government.

Now, the type of charges that we are allocating against this fund are these: The cost of top administration at Hanford—that is, Mr. Prout's salary—and direct service rendered the operations on the contract on the part of certain administrative departments, such as a portion of my time, a portion of your assistant comptroller's time, who spends a good deal of his time on this job. Then, also charges for services rendered the contract operations by other departments in the laboratories; that is, some of Dr. Jeffries' time from the chemical department, which he spends in connection with nucleonics committee; charges for the expense incurred within the research laboratory for administration of activity at the Knolls atomic power laboratory.

That is some of the time of Dr. Suits and so forth; and charges for costs and expenses properly, in our estimation and in that of the accountants, allocable to the contract but which, for one reason or another, are not permitted direct reimbursement at either Hanford or Knolls.

Illustrative of this charge is a community-chest contribution at Hanford, and the cost of operating three automobiles which we have at Hanford, which were purchased by the company.

Now, those charges will be accumulated; they will be examined by a firm of certified public accountants approved by the Government, and the amount of those charges will be subtracted from the amount accrued under this \$200,000 per month payment and the excess will be returned to the Government, so that there is no profit there. The only profit whatsoever which we realize from this operation is that on such standard electrical equipment which we may supply to Hanford or to the Knolls Laboratory. And that is supplied on a competitive basis, and to date the figures show that we have received orders for only about 50 percent of such equipment which has been supplied, and I think we might reasonably expect to obtain that amount even if some other firm were operating Hanford and Knolls, so I feel that we are perfectly sound in claiming that we get no dollar profit other than the one dollar from the contract, Senator Vandenberg.

Senator VANDENBERG. Well, there was nothing sinister intended by that.

Mr. WINNE. No; I appreciate that, but I am glad to have the opportunity to explain the administrative fund because there has been so much misunderstanding about it.

Senator VANDENBERG. This is the question I wanted to get clear in my mind: I understand the Commission affirmatively approved the \$6,000,000 proposal; is that correct?

Mr. WINNE. Yes; they approved that.

Senator VANDENBERG. In the first instance. Then, does the project multiply three times without any further affirmative action by the Commission?

Mr. WINNE. No; they affirmatively approved—what was it? \$8,760,000.

Senator HICKENLOOPER. The Commission or the local managers?

Mr. WINNE. Well, to us the local management represents the Commission, Senator; I do not know.

Senator HICKENLOOPER. Yes. I just wanted to get that point straightened out.

Senator VANDENBERG. Where do you get your responsible authority for moving on from \$8,000,000 to \$25,000,000?

Mr. WINNE. Only in this particular case? Only the authority for doing this job. There was no, I think, definite approval—I mean, there was no written official approval of the further expenditures, except that the Commission construction representatives were working right on the job with us at all times, and knew the progress of the work and had available to them such cost reports as we, in general, had available.

We made, as I said, monthly reports which got to them about a month late, but again, as I say, this job, in the estimation of ourselves and of the Commission, was a job which had to go through and had to be done even if it were going to cost more.

Now, as a result of this particular instance we and the Commission both have tightened up very greatly on the operations in this respect.

We are going to insist in the future that we make no project estimates which are accepted as such until we have the design far enough along so that we can make such an estimate, and that means 75 percent or so along.

Had we done that on this job it would be nowhere near ready to go today. It all depends on the urgency of the job as to what steps shall be taken. But in the future we are going to make very certain that the conditions of the estimate are known fully to the Commission.

We have tried to do that in general in the past, but there have been mistakes and omissions, as there always are in any big operation. We are going to do our level best to prevent those in the future, and to make sure that the Commission is at all times fully informed and approves in advance all such expenditures as are made.

Senator VANDENBERG. When was this change in policy decided upon?

Mr. WINNE. Early this year, Senator Vandenberg.

Senator VANDENBERG. Then, as I understand it, you are saying that you felt that you had firm authority from the Commission to complete the project, regardless of cost?

Mr. WINNE. That is the way we looked at it, Senator, bearing in mind at all times the necessity of keeping cost to a minimum of cost.

Senator VANDENBERG. Certainly.

Mr. WINNE. But we felt that this job had to go through regardless of cost.

Senator KNOWLAND. Mr. Chairman, just before you adjourn, I would like to get for the record, if they could be supplied, as I understand it, the monthly figures which were supplied.

I would like to get your figures to the Commission, with approximately a 30-day time lag on it.

Mr. WINNE. Something like that.

Senator KNOWLAND. I would like to get the monthly figures, and what they show right up to the time that the Commission apparently sent this committee out to investigate the matter.

The CHAIRMAN. Would you furnish those for the record, Doctor?

Mr. WINNE. I can give them right now if you like.

The CHAIRMAN. Now, Doctor, I said 1 o'clock, and it is 12 minutes after 1.

Mr. WINNE. We can do it any way that you please.

The CHAIRMAN. Submit them for the record, and then I want to make a copy available to Senator Knowland.

(The information referred to is as follows:)

ADDITIONAL INFORMATION SUBMITTED BY HARRY A. WINNE FOR THE RECORD IN CONNECTION WITH THE OPEN HEARING BEFORE THE JOINT COMMITTEE ON ATOMIC ENERGY, WASHINGTON, D. C., JUNE 15, 1949

Senator Knowland requested that the dates and amounts shown on the various monthly cost reports on the 234-5 project, as submitted by the General Electric Co., be included in the record.

With the exception of October and November 1948, during the period of the major construction program, construction cost reports were issued by General Electric Co. each month. Copies of these reports were furnished as a matter of routine to the Atomic Energy Commission. Reports for the months prior to October 1948 set forth for each project (1) the expenditures for labor and

material incurred to the date being reported upon; (2) outstanding commitments as of that date; (3) percentage of physical completion of the work; and (4) the amount of authorized funds. Indirect costs were accumulated separately for later allocation.

During the month of September 1948 a change of accounting method was mutually agreed upon by General Electric and the Commission whereby the indirect costs such as project administration and construction overhead would be allocated to each project each month instead of at completion of the program and would be included in the report together with labor and material costs.

The clerical change-over acquired to give effect to this change was completed in time to issue the December report on the new basis. Therefore October and November were included in that statement and not issued separately.

Beginning with reports for the month of December 1948 the regular monthly reports showed for each project (1) the labor, material, and indirect costs incurred to the date being reported upon; (2) outstanding commitments as of that date; (3) percentage of physical completion; and (4) amount of authorized funds.

Below is a tabulation of data with respect to the 234-5 project taken from the regular monthly cost reports.

*Data concerning financial information on the 234-5 project taken from regular monthly cost reports issued by General Electric Co.*

[Amounts in thousands]

Date issued	For period ended—	Costs	Commitments	Total	Percent- age com- pletion	Directive amount
June 18, 1948.....	May 31, 1948	\$326	615	941	15	\$6,255
July 26, 1948.....	June 30, 1948	638	1,002	1,640		6,255
Aug. 20, 1948.....	July 31, 1948	970	1,258	2,229		6,255
Sept. 28, 1948.....	Aug. 31, 1948	1,341	1,609	2,950		6,314
Nov. 1, 1948.....	Sept. 30, 1948	3,201	1,810	5,011		6,314
Jan. 28, 1949.....	Sept. 30, 1948	3,005	1,810	4,815	23	6,314
Feb. 25, 1949.....	Dec. 31, 1948	9,059	2,628	11,687	43	8,760
Mar. 15, 1949.....	Jan. 31, 1949	12,601	1,710	14,311	68	8,760
Mar. 31, 1949.....	Feb. 28, 1949	15,697	1,130	16,827	87	8,760
Apr. 20, 1949.....	Mar. 31, 1949	17,820	943	18,763	96	8,760
May 20, 1949.....	Apr. 30, 1949	18,733	542	19,275	99	8,760

<sup>1</sup> Labor and material only, see above.

<sup>2</sup> Includes indirect costs for first time, see above.

<sup>3</sup> Revised due to reallocation of indirect costs.

From the above, it is apparent that the report issued September 28, 1948, showing only 21 percent completion with \$2,950,000 expended and committed, not including project administration and overhead, indicated the possibility of a very considerable overrun. This became even more definite of course with the report issued November 1, 1948, and in the succeeding reports.

However, in fairness to the Atomic Energy Commission, it should be pointed out that these figures were available to us a short time before they were available to the Commission and our management at Hanford should have been cognizant of the approaching overrun and have brought it specifically to the attention of the Commission representatives. As I stated in my verbal testimony, the reasons this was not done were several, including a change in accounting methods in the fall of 1948; the great pressure of construction work in addition to the 234-5 project, work much larger in volume than this particular project; and, above all, the concern, on the part of everyone involved, with the great urgency of this project and the feeling that it must be pushed ahead at maximum speed whether or not the estimated cost was exceeded, so long as money was not actually wasted.

Also, in fairness to the Commission, it should be pointed out that the original estimate of \$8,255,000 was made by the General Electric Co. and presumably the Commission relied upon the accuracy of this estimate. As I previously pointed out, however, this estimate was made on the basis of the extremely small amount of available information and was no more than a guess at probable costs.

In one of my responses to Senator Vandenberg I believe I said that the General Electric Co. had not received written authorization from the Commission to proceed with expenditures beyond the figure of \$8,760,000. I find that this was in error as on February 23, 1949, Mr. F. C. Schlemmer, Atomic Energy Commission manager at Hanford, issued instructions to us to complete only phase I of the project pending further review by the Atomic Energy Commission. Completion of phase I will permit operation on a scale sufficient to take care of the present output of the Hanford Works.

HARRY A. WINNE,  
*General Electric Co., Schenectady, N. Y.*

The CHAIRMAN. I take it Senator you did not want to examine on these figures?

Senator KNOWLAND. I just wanted to know.

The CHAIRMAN. You just wanted them in the record.

Thank you very much, Dr. Winne.

Mr. WINNE. Yes.

(Whereupon, at 1:15 p. m., the joint committee adjourned, to reconvene at 10:30 a. m., Thursday, June 16, 1949.)

# INVESTIGATION INTO THE UNITED STATES ATOMIC ENERGY PROJECT

---

THURSDAY, JUNE 16, 1949

CONGRESS OF THE UNITED STATES,  
JOINT COMMITTEE ON ATOMIC ENERGY,  
*Washington, D. C.*

The joint committee met, pursuant to adjournment, at 10:35 a. m., in the Caucus Room, Senate Office Building, Washington, D. C., Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon (chairman), Representative Durham (vice chairman); Senators Vandenberg, Millikin, Knowland, and Hickenlooper; Representatives Holifield, Price, Jackson, and Elston.

Also present: Dr. Ernest W. Thiele, special consultant to the joint committee; David E. Lilienthal, Chairman; Lewis L. Strauss, Commissioner; Gordon E. Dean, Commissioner; Henry D. Smyth, Commissioner; Carroll L. Wilson, General Manager; Joseph Volpe, Jr., General Counsel; Everett Hollis and Bennett Boskey, Office of the General Counsel; Morse Salisbury, Director, Robert Tumbleson, and Rodney Southwick, Division of Public and Technical Information Service; Edward Brosnan, Division of Security; Frances Henderson, Assistant to the Chairman; Fletcher C. Waller, Director, Division of Organization and Personnel; C. A. Rolander, Chief, Violations Branch, Division of Security; Kenneth S. Pitzer, Director, and Paul McDaniel, Division of Research; Francis Hammack, Acting Director, Division of Security; George Marvin, Division of Production; Dr. Walter H. Zinn, Director, Argonne National Laboratory; Winston Manning, Chief, French Hageman, and Frederick Thompkins, Chemistry Division, Argonne National Laboratory; Paul Fields, Chemist, Argonne National Laboratory; Richard Dunsworth, Metallurgy Division, Argonne National Laboratory; Steven Larowski, Chief, Chemical Engineering Division, Argonne National Laboratory; William McConnell, Buildings and Grounds Department, Argonne National Laboratory; Mark Ingraham, Physics Division, Argonne National Laboratory; James Yore, Chief of Security, Chicago Operations Office; and Walter Kowalski, Assistant Chief of Security, Chicago Operations Office, all of the United States Atomic Energy Commission.

The CHAIRMAN. The meeting will come to order.

Dr. Zinn, I believe you are to be our first witness this morning. Will you come up and take the witness chair?

Doctor, you are free to have any of your assistants whom you wish with you to advise you.

**STATEMENT OF DR. WALTER H. ZINN, DIRECTOR, ARGONNE NATIONAL LABORATORY, ACCOMPANIED BY JOSEPH VOLPE, JR., GENERAL COUNSEL, UNITED STATES ATOMIC ENERGY COMMISSION**

Dr. ZINN. Well, we have a number here, but I could call for them at the time necessary. They are sitting over here.

The CHAIRMAN. All right.

Gentlemen, we have with us this morning Dr. W. H. Zinn, who is Director of the Argonne National Laboratory. Dr. Zinn is the gentleman who was in charge of the building of the first reactor pile in this country and, of course, that was the first in the world; and Dr. Zinn, as I have said, is now in charge of the Argonne National Laboratory.

Doctor, we have spent many hours with you in executive session examining into the loss of U-235 in Chicago, and the explanation of its recovery.

We believe, all of us, that it is most desirable to have an open hearing on this situation; and Senator Hickenlooper, of course, was particularly anxious to examine into the facts of the matter, particularly in regard to the finding of the now well-known bottle.

Senator, in accordance with your desires in the matter, suppose we have Dr. Zinn proceed—or do you want to question him preliminarily?

Senator HICKENLOOPER. Mr. Chairman, I would merely like to make an outline of the background of this matter in order that Dr. Zinn or anyone else can understand the particular matters that are still troubling me about this thing, and the areas about which I believe there is still substantial mystery about the whole situation.

The CHAIRMAN. I think that is quite all right, and quite in order.

Senator HICKENLOOPER. I make no particular allegations at this moment, but there are a certain series of facts that I think could be as clearly outlined as possible in approaching this thing.

In the first place, according to my understanding, on September 16, 1948, some enriched material, uranium, enriched over its normal U-235 content, with uranium 235, was transferred from one place where it was located to another vault at some distance from the place of its original location, that is, the location bottle in which it was contained. That is according to the records.

Later, and I believe on February 7, 1949, in connection with the search for or the desire to locate some other material, this vault to which this material had been moved in September was opened, and the particular enriched uranium material was not there.

Then, a little bit later—no, I should say when this was noted, an investigation was begun in the Chicago area, and checks were made of inventories, and the material simply was not found. The container was not found, and the material was not located.

Thereafter, and after a matter of weeks, and on about—yes, the date upon which this particular item was missed was on February 7, 1949. The loss was reported, I believe, to the Chicago AEC security office about a week later.

Then, about 5 weeks later, late in March, the exact date I do not think is necessary to be given at this time, although I could very easily here, the Washington Division of Research of the AEC learned

of this loss. A report was prepared by the Chicago division on March 25.

The FBI was notified a few days later, and in April, early in April, the General Manager of the Commission was notified of the loss in writing. Thereafter searches were continued, in which the FBI participated; and on April 27, 1949, the joint committee was advised by letter, I believe addressed to the chairman or to the staff director, who received it.

Then, on May 18, 1949, the membership of the committee, the joint committee, was notified of this loss.

A few days later in executive meeting, a meeting was had with you, Dr. Zinn here, and at that meeting it was emphasized and reemphasized that the missing material had been contained in a brown laboratory bottle. A duplicate of that bottle allegedly was produced here, passed up and down the committee. It had material in it that was of the same approximate weight in order to illustrate as nearly as possible exactly the container, and it was testified to here by a number of people out there that this was the same type and kind of bottle in which this missing material had been kept.

Then, a week or so later, after a search of a dump used by the Commission, and I believe on May 25, when this dump or refuse depository had been opened, the committee received a report that the bottle had been found, and the committee was given quite definite assurance that this unquestionably was the bottle.

At that time the committee, I am sure, still was under the impression—because I do not recall that that impression had been changed—the committee was assured that the brown bottle had been found in which this material was alleged to have been contained.

I asked for the full reports on this matter, and in going through them I found that the bottle that was found was not a brown bottle at all. It was not a normal routine laboratory bottle, but it was a clear Ball mason fruit jar bottle which was found in this dump.

I say this, and I am bound to say it, because of the situation that I believe the committee was put in at that time, and I say this not in any degree of criticism but I say it because I would have said the same thing under the circumstances. The chairman of this committee was permitted, through the information that he had been given after the alleged finding of this bottle, to announce publicly that the brown bottle had been found, and I hold no criticism of the chairman for that announcement, because that was my understanding, having attended the committee meeting, and as a result of the report by the Commission to our committee of the finding of this bottle.

It was not until I began to examine the actual reports that had come in that I discovered that the committee, I believe, was somewhat embarrassed by the brown bottle announcement, and the mystery of the clear Ball mason fruit jar which was found has come up.

Now, I am not going to speculate, Doctor, on the detailed information in these rather voluminous reports other than to say that I have gone through the reports of the investigating agency very carefully, and the reports of interviews at Chicago, and as a result of that I am still utterly mystified, and I am still unable to find in these reports any sound or acceptable evidence that would give reliable assurance that this was the bottle.

I am thoroughly convinced there is nothing in the reports that afford any conclusive proof at all that this was the container.

Now, the whole thing is clothed with a considerable degree of mystery to me. I think it is a vital matter. I call attention to the fact that there is still approximately 4 grams missing and still unaccounted for by any accounting method or examination method that I have been able to find, and a great deal of time, trouble and money has been spent in the exploration of this mystery; and I am interested in any conclusive evidence that can be brought to bear or any facts that can give us any relief other than what we have already had.

I make this outline because those are the things I am thinking about. It is the area with which I am concerned, and I am still concerned with the idea that there is still no conclusive proof whatever that the material itself has been discovered.

The CHAIRMAN. Senator Hickenlooper, your recollection, I am sure, is better than mine, but I do not recollect having denominated this bottle by color. Now, it is quite possible that I did. I am not contradicting you, but I just wondered whether you were sure of that fact.

Senator HICKENLOOPER. Well, I did not attend the press conference, Mr. Chairman.

The CHAIRMAN. I would be quite willing to take whatever the press indicated I said about it because I have no independent recollection of it.

Senator HICKENLOOPER. And I have a number of press clippings, Mr. Chairman, in which the press quotes the chairman as saying that the brown bottle had been found. I say that in no criticism because I would have said the same exact thing if I had been giving the press interview.

The CHAIRMAN. I understand that, and there is no effort upon my part to say that I did not say it was a brown bottle because——

Mr. PRICE. Mr. Chairman?

The CHAIRMAN. Just a minute, Mr. Price. If that is what the press reports, I am sure that it is reported accurately, and that their recollection written down at the time would be much better than mine now, but that clears that up.

Mr. PRICE?

Mr. PRICE. Mr. Chairman, I would just like to say that I sat through almost every hearing on this Argonne Laboratory matter, and I never remember at any time any great importance being placed upon the color of the bottle. I do not even remember that anyone ever mentioned it as being a brown bottle.

The CHAIRMAN. Well, you see, Mr. Price, there was a bottle produced, an ordinary laboratory bottle, in our executive hearings, which contained a quantity of brown oxide, and this was—contained what, Doctor?

Dr. ZINN. Tungsten, actually.

The CHAIRMAN. Really? This was passed around as being the kind of laboratory bottle that was used in the laboratory.

Mr. PRICE. They did not say that was the bottle that was missing.

The CHAIRMAN. Of course, I think, as it will develop when we give Dr. Zinn a chance, that we are talking about something that can really be quite easily cleared up, if I understand the situation correctly and, Doctor, I am sure you are quite competent to do it.

Mr. Volpe?

Mr. VOLPE. Mr. Chairman, I have here the report which was read to the joint committee during the executive session to which Senator Hickenlooper has made reference. I am sure that the committee minutes include this report. I would like to read one paragraph. It says:

The FBI was asked to have persons present observing all phases of the disinterment of the containers. Four containers were dug up, and in the second container, 107, near the bottom, among a number of other bottles, one clear Mason-type jar was found that had legible figures on its label.

Now, this was the report that was read to the committee in executive session.

Senator HICKENLOOPER. Mr. Chairman, it was after that meeting—this increases the mystery, and as I say, had I been making the statement that the chairman made after that meeting, I would have made the same statement because it was my clear understanding that was the meeting after which the chairman in his statement to the press said that the brown bottle had been found.

The CHAIRMAN. Now, Senator, I have just received a signal from one of the reporters—I will not indicate which one—out in front of me, who shook his head when that statement was made, so his recollection is not to that effect.

Have you any clippings that indicate that I have denominated it as a brown bottle? We will be trying the veracity of the report given by the chairman in his report to the press, which seems to be a little ridiculous, because what we are interested in really are the facts.

Now, in the press releases that I made there was no reference to a brown bottle. I am talking now about written releases.

I am reading now from a note that a member of the staff has just given me:

The press releases show no brown bottle, one dated Thursday, May 19, the other dated May 25.

It does not mention the bottle being of a brown color.

Senator HICKENLOOPER. Here is a news release of June 3, 1949, where it said:

Chairman McMahon of the Joint Congressional Atomic Energy Committee announced late yesterday investigators have found the missing brown pint bottle which had contained 10 to 12 ounces of uranium oxide, and which vanished from a Chicago laboratory last winter.

That is from the Times-Herald of June 3.

The CHAIRMAN. And the others?

Senator HICKENLOOPER. Yes.

The CHAIRMAN. There is no disparagement to the gentleman who wrote the story.

Senator HICKENLOOPER. This is a report of a very distinguished lady reporter, Mary Spargo, who sits over here, June 3, 1949, as follows:

From the Chicago graveyard of radioactive materials, gas masked workers, protected by Geiger counters, have dug up the brown bottle which originally contained the uranium 235 which vanished from the Argonne Laboratory in February.

They quote Senator Brien McMahon, as chairman of the joint committee, in this story—that is the story, apparently—

The CHAIRMAN. I think there is no use in debating this. The thing for us to find out is if the brown bottle description was used, how it

came to be used, and does it affect the veracity of the story, which I know, too—Doctor, you are shaking your head, too—know that it does not, and I know that the bottle that contained the missing material was the one that was dug up in the dump, if scientific evidence means anything to me.

So, you go ahead and let us hear about the brown bottle.

Mr. DURHAM. Mr. Chairman.

The CHAIRMAN. Mr. Durham.

Mr. DURHAM. In looking through the minutes here of the executive meeting, I do not know where this bottle got the brown color. From all the information that Dr. Zinn gave us, I do not find where he designated it in the executive session by color at any time.

Senator HICKENLOOPER. I do not know about the exact verbiage of the executive session, but Dr. Zinn will admit himself that he brought a bottle of brown color—

The CHAIRMAN. He did not.

Dr. ZINN. I did not.

Senator HICKENLOOPER. The bottle was brought before the committee and passed up and down, and was examined.

Mr. PRICE. You did not suggest that was the missing bottle; did you, Dr. Zinn?

Dr. ZINN. No, sir.

May I please state first that those of us in the laboratory are extremely anxious that the real facts in these cases be presented. No one can be more anxious than we are.

I, first of all, want to say that I am completely and absolutely convinced that this is the bottle in which the misplaced material was contained, and that I have been told by the FBI agent who made the investigation, that his investigation led him to believe and convince him that this is the bottle. I want to say also that from the moment that the FBI was called in on his case, I understood that we in the Laboratory were not to do investigations, and that only to a small extent have we quizzed people and asked them questions.

I would like to say in connection with this bottle that the kind of bottle that it was, and its general description, came to my attention in the kind of detail that has been referred to here, when the agents of this committee, Mr. Heller and Mr. Borden, were in Chicago asking questions. This, I believe, was on May 20 and 21.

I heard them asking questions of members of the laboratory: "What kind of bottle was this?" And so on.

The next thing I saw, and I stood in the background, was I think Mr. Heller going with someone to a stockroom saying, "Let's get a bottle like it," and they came back with a brown chemical bottle. That was my first recollection—is my first recollection of a brown bottle.

I am not sure that all of the people who reported to the FBI—and they are the agents really who asked the questions—insisted that it was a brown bottle. I have quite a lot of skepticism that people said to the FBI: "It was a brown bottle."

It was Mr. Borden and Mr. Heller's idea to bring a facsimile bottle in here, and I did not bring it in, and being, perhaps, a little skeptical myself, I do not think I would have been pinned down at the moment that we had definite categorical statements from anybody that it was a brown bottle.

Senator HICKENLOOPER. May I read an excerpt, paraphrase an excerpt from the report from Chicago, Doctor? I will paraphrase it because the report is really a classified report, although this particular information is no longer classified; it has been made public.

In this report the report notes that the bottle recovered was not a brown bottle as had been previously testified to by a majority of the witnesses.

Now, I would be glad to have you read this so that you can get the exact verbiage if you want to.

Dr. ZINN. I think the two things to note there, Senator, would be that it was only a majority, and that furthermore it is an eyewitness account. Now, really, before we see the other evidence on which I base my conclusion that this is the bottle, we must understand that eyewitnesses frequently say things which were not so.

Senator HICKENLOOPER. That could apply to those who said it was a clear bottle as well as those who said it was a brown bottle.

Dr. ZINN. Yes, sir; and I believe to pin this identification of the bottle on the color of the glass is really not giving proper weight to the other evidence.

Senator HICKENLOOPER. I am fully aware that the important thing is the question of whether or not conclusive proof or fully acceptable proof has been developed as to the location of the major portion of this.

I merely mentioned the question of the confusion on the bottle originally believed to be a brown bottle and later when one was dug up it was a clear mason-type jar, perhaps tests the general validity of the recollections of the historic background of this matter.

Dr. ZINN. May I reply by requesting permission to detail as I know it the actual history of the finding of this bottle? I will have to relate things that were told to me by the FBI agent who has been extremely cooperative, and I am sorry he is not here. He could do this better than I can. If I could have permission to relate the story, I think the Senator will see that the bottle was found and identified not by its color.

The CHAIRMAN. Doctor, I think it would be much better if you would try to briefly give us the story of the loss. You see, the committee has heard it in executive session, but the public has not, the press has not, and this business of just taking this bottle and neglecting the background of it, it seems to me, is quite ridiculous.

I think you should tell the story, and then proceed to put this in its proper place. Will you do that, Doctor?

Dr. ZINN. I would be glad to, with a clear understanding, if I may, that we will come back and clear up this point.

The CHAIRMAN. Oh, well, you will go into this point as you go along, but I want a connected story of the loss of this uranium, how it came about, how it was discovered, what you have done about recovering it, and the bottle will fall into its proper relative place. Do you not think that is the best way to handle it?

Dr. ZINN. Yes, I would be glad to do it, having in mind that it took me five and a half hours to do it last time.

The CHAIRMAN. Well, we do not propose, I think, to take you over any such tortuous road as you went over the last time. Perhaps there will be much examination after you get through, but just give us a running account of the instance.

Dr. ZINN. Yes. It must be understood that the metallurgical department, which was the department in which this material was misplaced, was used—is a department which normally works with unenriched uranium and a lot of it, not grams or pounds, but hundreds of pounds, and even tons.

Because of an urgent need for an experiment sometime ago, and because there was not any other facility in the AEC or in the country that could do the work, these people were asked to do some fabrication work on an enriched sample of uranium.

The CHAIRMAN. Doctor, I assume that you are keeping in mind classification as you go along?

Dr. ZINN. I am, sir. I am not going to mention enrichments, for instance.

The CHAIRMAN. Thank you.

Dr. ZINN. Except in a code fashion, so that the committee knows.

The CHAIRMAN. Although the enrichment was in the story that was published; was it not?

Dr. ZINN. Not categorically so.

The CHAIRMAN. It could be figured out.

Dr. ZINN. I did not check to see how accurately figured out.

The CHAIRMAN. Well, I have had it figured out.

Dr. ZINN. Yes, sir.

Now, this department which normally handled unenriched material did this job; it fabricated something out of a quantity of enriched material.

In this fabrication they produced the finished articles, and they also produced certain debris, if you like, or machine turnings, and so on. Actually a number of items existed which added up to the main item of the finished article, the machine turnings, the coolant which was used to cool the machine, the filtering or the filtrate from this coolant, and so on.

This material was stored in their special-materials vault, which is a vault which has a three-way combination lock.

Also in this vault was stored a large quantity of natural uranium. This is not our general practice, and it is only because this department never before or since has handled enriched material that this expediency existed.

Senator KNOWLAND. Doctor, right at that point, if I might clarify it, when you say it was stored in a vault, could you indicate to the committee, is it normally—leaving aside the color of the bottles for the moment—stored in bottles, in boxes, in tins, how is it stored? Is it left open or what?

Dr. ZINN. Well, normally it sits on a shelf—I mean it did there—not otherwise in the Laboratory.

The usual procedure with enriched material is to put it inside a three-way combination safe inside a vault. Here they had no safe. The vault was full of stored natural uranium of one kind or another, and it was on a shelf in the containers which it had been put in by the metallurgist actually who had collected the stuff, and so on.

Senator KNOWLAND. And these containers are glass containers, are they, normally?

Dr. ZINN. No. One sample was in a rather heavy stainless steel, should I say, box. It was a cylindrical box. Another sample, which

was a liquid solution, was in a glass graduate, so you could read how much. The bottle that we speak about contained the machine chips, and another smaller bottle contained the ashed filter paper on which some material had been recovered.

Now, it was the desire of the laboratory special-materials department not to permit that kind of storage, and they issued a bulletin for all that type of divisional responsibility in storage to cease, and these materials to be transported to a central vault under their control, which had only enriched material in it, not normal material at all.

It is fairly certain now that what happened is that the young man who packed up this material thought he had packed all of it in a package which was moved to this central vault under armed guard, according to the regulations, the vouchers filled out by the exit and entry guards showing the time during which it was moved, and so on; but it is fairly certain that this bottle in question—I believe it is certain—was left out and stayed in the original vault.

Senator KNOWLAND. Right at that point, even though the inventory that the packer filled out indicated that the bottle was a part of the shipment, your contention is that despite that documentary evidence, the bottle containing this enriched material was nevertheless left at its place of origin—where it was supposed to be sent from—and did not arrive at the point of arrival; is that correct?

Dr. ZINN. Yes, sir; and the documents show this, and our explanation of the point is that the bookkeeping for enriched material is complicated, and I believe was at that time weak in the sense that it carried the total amount of enriched uranium and did not carry all the other figures which show how you get this total amount.

The young man who did the packing clearly was not capable at that time of understanding the figures well enough to know that he had left something out.

Senator KNOWLAND. Did the man who received it understand enough to know that something was left out at the time he received it?

Dr. ZINN. The receiving of the package was, I think again, in looking back at it, a hole in the inventory system. It was going to dead storage, so to speak, and was to be stored just as is, and the transfer documents were used to adjust the inventory of the receiving vault and decrease the inventory of the transmitting vault. They did not make a physical inventory of the material when it was stored. It was delivered; it was put into the vault, and stored there.

Senator KNOWLAND. In other words, so that we may have the picture clear, here was some very valuable material, valuable enough to be kept in a three-way combination safe; it was packaged up, presumably; it was to be sent from point A to point B. Upon its arrival at point B, apparently there was not a detailed check as to what was in the package, but the package itself was to be put in a vault at point B, left for some considerable period of time before being checked.

Is that substantially correct?

Dr. ZINN. Yes. I believe this is a hole, so to speak, in that method of operation which, of course, by now we have corrected.

Now, there is an audit by a separate individual, both on leaving and on receiving, an auditing officer, who is not either the sender or the receiver.

I might say this was done when it was transported from one user to another user. The only case in which this was not done is when we went to this central storage vault which was, so to speak, a safe place. It is really a fine vault. It is in a building by itself. It has an outer door, which is opened by key, and then an inner vault, and the material is in there. The slip was that there was not an inventory when it went into this dead storage, this holding place.

Senator KNOWLAND. I do not think it is mentioned, and it is difficult to follow unless you do mention it, the approximate date when this material was supposed to have been shipped from the metallurgical laboratory to point B. In other words, was that in November of 1947?

Dr. ZINN. That was September 16, as Senator Hickenlooper has said.

Senator KNOWLAND. September 16, 1948?

Dr. ZINN. And the transfer documents carry these dates, and the notations.

Senator KNOWLAND. When was the loss first discovered?

Dr. ZINN. It was discovered on February 7, when one of the special materials men went to this other vault and checked in detail the material there against his figures, and he is a man who understands exactly, when you say there are so many grams of enriched material, how to figure back from that to how many grams of uranium oxide or uranium material there was in the bottle.

Senator KNOWLAND. So there were approximately 5 or 6 months between the time that the shipment arrived at the vault in point B and when the loss was discovered?

Dr. ZINN. Yes, sir.

Now, I would like to—

The CHAIRMAN. Doctor, do you mind an interruption while I announce that the committee's adviser, Dr. Thiele, is sitting on my left, between Mr. Durham and myself? I just want to have him identified for the record.

Dr. ZINN. For the story, I would like to explain that in the vault, and in the area in which this vault was, the metallurgical foundry machine shop and some laboratory, there is a problem in the recovery of used metals. It should be clear to everyone that, if you take uranium metal, we usually start with uranium salt and convert it into metal in a certain operation, and then it is cast into an ingot, and then it may be rolled or machined or handled in the way in which metals are ordinarily handled. In these operations certain debris forms.

Now, these materials are either in the form of uranium oxide, which comes about, to people who know about uranium, in a perfectly natural way. I do not think I should explain this, sir, or it is in the form of actual machining chips which again have to be handled in a careful way because of a certain hazard connected with them.

There is a stated fashion in which the laboratory, through certain people, collects this material to be recovered. This material is put into galvanized steel cans; they are really high-quality garbage cans, with tight-fitting lids.

This material is put into these metal recovery cans, and is stored in the vault until there is a certain amount, and the amount cannot be very large because the cans then get too heavy to move, and

eventually this material is shipped to a metal recovery plant, under contract to the Atomic Energy Commission, where this oxide, if it is oxide, uranium oxide, is processed, and, mind you, it may have a lot of other things in it beside uranium oxide, because it is coming from a fabrication plant, a fabrication area, so this matter of recovery of uranium debris from the machining operations and the handling operations is a well-established thing.

We know, therefore, that in this vault, at the time when the bottle was really there, there was also in the vault these cans in which material, used material no longer needed, uranium oxide in great extent, is placed.

By the way, this laboratory does not ordinarily deal with uranium oxide. It is what you get from the machining operations, and so on.

Now, I would like to jump ahead to the time when this loss was discovered, the loss of the bottle. Immediately the records were inspected; people were talked to, not by me, and the suspicion became very clear that the bottle had not been shipped.

Of course, the originating vault was thoroughly searched, but the next point was to really search hard throughout the laboratory for two things: Either to find the bottle intact or, secondly, see if we could discover that it got mixed up with some normal uranium.

Now, in this laboratory there are literally tons of normal uranium. Here is a small amount of material that looks like uranium; it is uranium by all ordinary tests; it is uranium; it was conceivable that it could have gotten mixed up with this material. If it had gotten mixed up with it, it can only be detected by a rather elegant type of testing which is mass spectroscopy, and normally we do not in our laboratory make mass-spectroscopy analyses of our uranium. This requires a special laboratory. I will come back to that later on.

So, searches were begun, not only for the intact article, but also for the possibility of it being mixed up in another lot of unenriched uranium.

The way you would have to find that, of course, is to make some test which shows enrichment. Very thorough searches showed that the bottle itself, so to speak, just did not seem to exist; no bottle carrying the right label or any type of description did exist anywhere. But one of the members of the Special Materials Department of the Atomic Energy Commission in Chicago remembered that we had in storage, waiting for shipment to the metal recovery plant in Philadelphia, a number of these galvanized iron cans containing oxide, and this other variety of uranium debris. As a matter of fact, there were 12 of these cans altogether, and the question was asked, could this enriched material have gotten into one of these cans? The question was asked early in April.

It was discussed with some of the physicists in our department, and they suggested to this AEC special-materials man that maybe we did have a test which was very sensitive right at Argonne for finding enrichment.

Now, this test involves getting a small sample of some material and putting it into the chain-reacting pile which we have, getting it out again and making certain measurements on the delayed neutrons. All of these 12 cans which were in storage and behind a locked door waiting for shipment in the control of the Special Materials Department of our laboratory were sampled by a method that is called "thief sam-

pling," if I may use that word at this hearing. One takes a probe, and extracts a small amount from various areas in these cans. Actually I still have all the samples, or the laboratory has them. They collected them. It must be 40 or 50 samples from these 12 cans, 4 or 5 from each can.

Senator HICKENLOOPER. How many grams in each "thief sample," Doctor?

Dr. ZINN. I would say something like two.

Senator HICKENLOOPER. I see.

Dr. ZINN. It is a little plug like this.

Senator HICKENLOOPER. There are four grams still missing, I understand?

Dr. ZINN. That is four grams of enriched material, and this is material out of a recovery can.

Now, these were tested, and among all of these "thief samples," when they were put into a pile and tested, and this is laborious work, by the way, which took place at the beginning of April, I do not remember the exact date, but as I recall it around April 12, they got an indication that one of the samples had four times the enrichment that normal material has.

Now, this does not come about by accident. Enriching uranium is a difficult art, and this meant that somehow or other enriched material had gotten into this metal recovery can No. 3.

At that moment, and I would say really the action of the Atomic Energy Commission in Chicago was to correct the metal-recovery can No. 3 was dispatched immediately to Oak Ridge, where there is an analytical laboratory for recovering uranium, enriched uranium, and for analyzing it through mass spectroscopy.

I do not know the date, although we have the transfer documents. The can got down there and we waited; we were sure that we had enriched material. What we did not know was how much.

Well, they began their analysis; they also check the "thief sample," as the committee knows. You listened to the analysis by those who did the work; they found also that these "thief samples" from can No. 3 showed enrichment, and their next step was to dissolve all of the material in this can, and about May 19—I would have to look back to my document book which I have not with me—we got a letter from Oak Ridge which said that of the 30-point-something grams of enriched material, a little over an ounce we have talked about, and we, not Oak Ridge, are the ones who knew about that. Of that amount, 27.31 grams, their analysis at that time, their first analysis stated were found in this metal-recovery drum.

The CHAIRMAN. Now, Oak Ridge, when they made those tests, did not know the story that lay behind the sending down of this container? They did not know anything except that you wanted it tested; is that not true?

Dr. ZINN. Mr. Chairman, you asked the Oak Ridge people that question yourself.

The CHAIRMAN. I know I did.

Dr. ZINN. And the answer was they did not know.

The CHAIRMAN. That is right.

Dr. ZINN. Now, to us at that time—and by the way, this is just at the time when this matter became a public matter—I mean we hardly

had time to think in between before it was a public matter—the great concern was, and I believe still is, to account in a reasonable and technically satisfactory fashion for all of the material which we have some reason to believe was in this bottle originally.

I will have to back-track, perhaps. I would like to go on now to the matter of the missing bottle, so as to speak.

Senator HICKENLOOPER. Incidentally, Doctor, do you recognize this as the bottle which was presented to the committee [indicating]?

Dr. ZINN. That is the bottle Mr. Borden and Mr. Heller insisted on bringing from Chicago and bringing to the committee.

Senator HICKENLOOPER. Yes, and this was considered to be probably a typical bottle for the type of stuff that was there. Is that the general idea?

Dr. ZINN. As read from the testimony, and I really think the FBI man who did all the quizzing, and knows what he heard and his notes should show what he heard.

Mr. PRICE. But, Doctor, no one ever said at the time that was the identical bottle or the bottle missing was the same color as that; did they?

Dr. ZINN. I cannot imagine myself saying this for the simple reason the first discussion I heard of what kind of bottle it was was when Mr. Borden or Mr. Heller, one or the other, was trying to say, "Let's see a bottle like it," and well then they went to the stockroom and dug this one up, and I am quite willing to believe that it could have been a bottle like that. This is the kind of bottle that one puts things into. It is a mason jar, by the way. They are frequently used.

The CHAIRMAN. Mr. Borden is here, and when we finish he can explain how the brown bottle was produced here as a sample laboratory bottle.

Dr. ZINN. Yes.

The CHAIRMAN. Go ahead, Doctor.

Dr. ZINN. Now, I believe on Tuesday or Wednesday the Atomic Energy people appeared in closed session before this committee, and on the following Friday Mr. Heller and Mr. Borden arrived in Chicago and, of course, started to ask questions, and investigate.

I saw them at noon on Friday which, I guess, would be May 20, and we sat down and had a talk, and at that time they said to me, "This bottle in which the stuff was is really a very vital point," and actually to me that was the first time it clicked that it was a vital point. They asked what would have happened to this bottle. They asked "What would have happened to this bottle, do you think?" Well, there were a number of us at the table, and we began to surmise as to what would have happened to this empty bottle had what I have described—namely, an emptying of this enriched uranium to the metal-recovery drum actually inside the vault in which we believe we have placed both of them—taken place.

Well, the answer, on the basis of laboratory practice, should be fairly simple. If this man thought he was emptying a normal uranium bottle, and everyone I believe agrees that this bottle probably did not carry a label showing it was enriched material, and this was a hang-over from the war days when you never labeled a container with what was in it. We were very careful never to give away that

we had enriched material or plutonium or so on—I believe there is not a valid reason any more—but this was practiced, not to put enrichments and so on on top of containers. I think for security reasons it is obvious that you do not do this.

The CHAIRMAN. That is a matter that is very highly classified as top secret?

Dr. ZINN. Well, the classification of such things, of course, is going down with time, but originally, back in the days, I will say, in 1945, when the atomic bomb was a new thing, enrichment was a very important point.

The CHAIRMAN. Yes, but it has never been declassified, has it?

Dr. ZINN. No, sir, not that I know of.

The CHAIRMAN. And you said yourself you were not going to tell us the degree of enrichment, and I certainly do not want you to.

Dr. ZINN. Well, I said that if it is true that this bottle did not carry enrichment things on it, an enrichment statement on it, then it is entirely conceivable that the man who emptied it thought he was emptying normal uranium.

I will come back to this point later on as to why I think this is entirely conceivable.

Then he would be following laboratory practice if he took the empty container and put it in what we call a dry active waste container or a vessel.

Senator HICKENLOOPER. He would not wash it if he thought it was normal uranium oxide and he emptied it? He would not wash the bottle out and reuse it, is that not the—

Dr. ZINN. No, sir; this may startle you a little bit, Senator, but in laboratories which deal with radioactive materials and which are doing research, where often the amount that you are dealing with is very small and it is very important not to get cross-contamination, you never reuse glassware that has been used in a measurement; for instance, beakers and chemical glassware are used once, and then, I am sorry to say, must be destroyed. There has been plenty of trouble over not doing that because of the cross-contamination of measurements.

Senator HICKENLOOPER. My question was prompted by being told a number of times that normal laboratory procedure in cases like that where ordinary waste material was thrown away was to be to wash the bottle and to use it, put it in the back and use it for other inconsequential things.

Dr. ZINN. This is what we would not like to see done.

Now, mind you, you cannot guarantee what an assistant in the laboratory is going to do.

Senator HICKENLOOPER. There is no particular issue about it. I just have been told that.

Dr. ZINN. He would be following accepted practice to put that empty bottle into the dry active waste receptacle. There was one of these in the vault. They are placed in frequent places around the laboratory.

Now, I must go into a discussion of what happens to dry active waste. First of all, these receptacles are put there to receive non-valuable amounts of radioactive materials. For instance, if a man is doing an experiment and he puts underneath his beaker on the desk or on the bench an absorbent piece of paper, which is the practice,

and in manipulating a little bit of the solution gets down to the outside and gets into the absorbent paper, that piece of paper must go into the dry active waste container. It must not go into a waste basket. There are no waste baskets. These containers, dry active waste containers, are picked up with a special crew; they are monitored by the health physics safety people, and the material is taken to what we call a burial vault, which is really a steel box 6 feet high, 10 feet long, 4 feet wide, which, for shielding purposes, is set in the ground, and it is put in there, actually the operation is rather simple, because the receptacle, the dry active waste receptacle, has a very heavy kraft paper lining which is folded over the top edge, and then the reclamation men who do this work just fold up the top of that bag, and the whole bag in toto goes into the dry active waste vault.

Now, these vaults contain about 8 tons of such material. The material comes from all parts of the laboratory, including the biological parts and, of course, therefore include animal carcasses and so on.

It is considered that this material may represent a considerable hazard in the amount when it is all accumulated, because you never can tell when a mistake in the laboratory has put in the dry active waste container really something which is hazardous; that is the whole reason for handling it so carefully.

Therefore, I told Mr. Borden and Mr. Heller that it was very likely if laboratory practice would have been followed, that is where the bottle would be.

Next I told him that two other alternatives might have existed: The man who would empty it could have washed the label off the bottle, in which case there would be no hope of finding it, or he could have and he should not have, put it outside his vault in, what you would call, a waste basket.

Now, even here we do not allow the trash that accumulates in our laboratory waste baskets or any part of our operation to go into the normal waste collection channels. That waste is very carefully collected, and under some supervision taken to a city dump, and buried, so we know where it has gone, and the waste paper, for instance, cannot get picked up by waste paper salvage operation. This is done so that again we cannot run the chance of putting into paper channels any trace of radioactivity.

The Commission has been insistent that we spend the money, so to speak, to do these careful things.

Now, Mr. Borden asked, could we not really dig up these dry active waste vaults, go in them. I explained that this was a hazardous operation. I was very reluctant to ask men to do it. We really ought to have, I explained to him, a much better idea which vault, and so on, before we tried it.

Well, Mr. Borden and Mr. Heller left us on Saturday noon. I spent Saturday afternoon, Saturday evening, and all day Sunday questioning people to try to get a lead as to—well, a number of leads—this situation, but among other things, where was the bottle. This is the only time that I have broken my agreement—

The CHAIRMAN. Doctor, I was being asked that, too.

Dr. ZINN. I understand that. It is the only time that I have broken the agreement with the FBI not to do investigating. They are very—I understand it completely—they are very firm in not having other people mess in their business. [Laughter.]

During Saturday night and Sunday, and particularly on Sunday, I became convinced that the bottle was emptied during the month of November 1948.

I would like to give the evidence, and I would also like to state at this moment in the middle of Sunday I was told to get down to Washington, so I had to leave Sunday afternoon and get a plane.

Senator HICKENLOOPER. The emptying in November would then have to go on the theory that this bottle never was in the original shipment, as the records show. It had been left out of the original shipment in September.

Dr. ZINN. Yes. It fits in with that supposition. May I give the evidence that I accumulated on that Sunday? It is detailed and perhaps to me wearisome now, but if you want it, I am willing to give it.

What are the things that I became convinced of on Sunday? Well, we already knew that metal recovery can No. 3 had been shipped from the vault of which we speak on November 29, 1948, and had been taken to an entirely different building and put under lock and key there. That is the place where we were holding these metal recovery cans for shipment to the Philadelphia firm.

The previous shipment from the same place of metal recovery cans was on October 28, 1948, and that was according to laboratory practice, where they pick up the stuff once a month.

What I found out on Sunday, which made it more convincing to me that indeed November was the month, was this: I asked what kind of metal recovery can was this No. 3? I was told it was a 10-gallon one. I know what a 10-gallon can looks like. I asked some people whom I had in the office, in my office, "Did you always use 10-gallon cans?" They said, "No; we used to use 30-gallon cans." I asked, "When did you change from using 30-gallon cans to 10-gallon cans?" I got the usual type of answer, "I don't remember."

However, I got the stock-room people in the laboratory to work on their records, and I received from them on Sunday afternoon a synopsis of the records, and the record shows that the custodian of this vault in the metallurgical division up to October 1, 1948, requisitioned only 30-gallon cans. October 1 he got two 10-gallon cans and three 30-gallon cans. October 12, however, he switched completely to 10-gallon cans, and from then it has been 10-gallon cans altogether.

This suggested to me, perhaps, that after October 12 is the time to think about it.

Another point was brought to my attention, that 2 of the 12 metal recovery cans had rather large amounts of extraneous material, including water in them, and No. 3, which is the one in question, had water in it; and I began to ask how did the water get into those oxide metal recovery cans.

I found that there were two incidents which could explain the water: One was recalled by one man, that there was a fire in one of these cans. Again this is quite understandable, as I explained to the committee last time; the fire was put out with some water.

I got hold of the records; I found out that took place on November 28—excuse me, correction, February 28, or the last day of February of 1949. That was not can No. 3. That was the other one.

The other incident which was remembered was the one in which at the rolling mill, where a good deal of this oxide is created in normal

operation, a leak had occurred of a cooling water line, and that the floor had simultaneously water and oxide on it, and that this material had been picked up with a vacuum cleaner, and then the vacuum cleaner emptied into a metal recovery drum.

I tried to fix the date at which this had happened because I was fairly sure that that was the time in November when the particular bottle was emptied.

I cannot fix it exactly at all. I got people to remember that it was around Thanksgiving. I got one man to say, "I know it was before Christmas because I left your employment around Christmas, and I remember the incident." We called him on long distance telephone.

Now, these things really convinced me that November was the month we should look at.

I came down to Washington, came down to the Commission offices, and went to bed, and the next morning, the morning in which I testified here before the joint committee—this was May 23, I believe—I directed by telephone—I did not do it personally—I asked people to telephone Chicago to get to work exhuming the burial vaults which had been filled from this site during the month of November 1948, and I also asked that this be done under complete supervision of the FBI.

I then was here in Washington, and I think until Tuesday, sometime. I returned to Chicago.

The next time I put any attention on the missing bottle was around noon on Thursday. On Thursday morning, Dr. Thiele had come to my office, and I began to give him some of these records, and so on, and we went to lunch, and on the way back from lunch, in an automobile, I said, "Would you like to see this burial vault in which we are trying to find the material?" We drove down there. There was a guard there. The records show we went down there, Dr. Thiele and several more and myself, and the FBI man was there, and we talked to him.

We looked over the operation, and he said, "I have something here which is very interesting."

This was on Thursday noon. "I would like you to look at it." He showed me a cardboard box in which resided a bottle, a mason jar, and he asked me to look at the label. I remarked that the label carried legibly at that moment one number, "284.0 grams," which I recalled immediately as having seen on a transfer document, transferring this bottle at an earlier time, earlier than we are talking about, from one laboratory to another for analysis, analysis of its contents.

I mentioned this to Dr. Thiele at the time. The FBI agent said, "I am going to keep this." I think he said, "The label is quite illegible," and we returned to my office.

On the way back I recall saying to Dr. Thiele, "What is the probability that just any bottle has on it a number which we know is in our records? Isn't that rather hard to understand?" I do not know what his answer was any more. I thought it over for a little bit, and I then called the FBI man—I had to do it by radio—and said, "I believe we should look much harder at that label."

He then brought it over to one of the buildings, one of the rooms, and we looked at it. He and I and several others looked at it, and we began to see other things on the label and as a matter of fact, what had happened of course was during the time that he had it—and I

will come back to that for a moment, the label had been drying out; it had all been wet, and the numbers became visible.

Subsequently, the FBI in its investigations of this bottle found quite a few things on the label. They had to do some work on it. The label was partly off the bottle. The thing was wet, and so on. There is a photograph, I believe, the gentlemen of the committee have seen—at least it exists—of the FBI photographs of the bottle.

What happened just at that moment was this. We called the analyst, the chemist who had weighed the material the last time that was in this bottle, and had made out the transfer document returning it—this was in 1947—to the metallurgical vault, and we called him in, among other people—that is, the FBI did this; I was a spectator—and the bottle was also produced like this [indicating] and asked, "Do you recognize it?" Some people said, "Well, I have seen lots of bottles like that," but one man immediately looked at a number and said, "Why, that is the weight, 289.2 grams which occurs on the transfer document transferring it from my analytical laboratory to the metallurgical division."

By this time, the 289.2 was legible. It was quite legible and, furthermore, he said, "That is in my handwriting." This is Mr. Paul Fields, who is here today.

Mr. Paxman, among other people—

The CHAIRMAN. He is the FBI agent?

Dr. ZINN. I am sorry; I should not have mentioned the name.

The CHAIRMAN. Well, it is all right; it is done.

Dr. ZINN. And other people observed that the inside of the bottle contained visible, small, very dimly visible—

The CHAIRMAN. Doctor, may I interrupt you? I have a letter signed by the Attorney General, which I will read into the record later, which identifies the special agent, so we can both be entirely relieved of any onerous responsibility that might have gone by a joint slip, because—I will not read the letter now, but it says, "Please be advised that Special Agent W. Rulon Paxman"—go ahead.

Dr. ZINN. It is my understanding that I should not mention agents' names, and I will mention no others.

It was visible, you could see, that inside the bottle there were traces of materials, and immediately the question came up: What is this material? We made arrangements at once to have that material analyzed by our microchemists that evening for the enrichment of the material and as to whether or not it was uranium.

I could not go along with this, but the FBI people went along, the AEC security people went along, the Deputy Director went along to observe it. There were, you might say, a crowd that observed that analysis. It was done extremely carefully, and by the middle of the next morning we had a mass spectroscopic analysis made by the mass spectroscopy laboratory.

We had another analysis done by a new way, worked out in our laboratory, both giving enrichments agreeing within all experimental errors with what we supposed was in the bottle.

I might state here that there was no other sample in the laboratory of that precise enrichment.

There was a very small sample, much smaller than what we are talking about, within 10 percent—more than that, 20 percent—of

that enrichment, roughly. This sample is still in the laboratory and intact.

This, to my mind, identifies the material without question.

The CHAIRMAN. In regard to your inventory, you remember that I requested that the physical inventory be checked to see whether you had all of your enriched material on hand?

Dr. ZINN. I would like to later go into that.

The CHAIRMAN. I beg your pardon. I just wanted to emphasize the point that that has been checked.

Dr. ZINN. Now, I believe I can say what was found on this bottle label. This is a letter from J. Edgar Hoover to the AEC, and I believe it is, therefore, appropriate—

The CHAIRMAN. Could I see it first?

Dr. ZINN. It was a copy given to me of what the FBI found on the bottle label.

The CHAIRMAN. Have you consulted with the Commission about this?

Dr. ZINN. I have just been told by this gentleman here that it better not be read into the record.

The CHAIRMAN. That is my conclusion, Doctor. Certain percentages are spoken of here.

Dr. ZINN. In connection with one of the things there that I would like to bring out—well, it just could not be coincidence, and it is involved. It is technical, but it is very important as far as I am concerned, and I had nothing to do with bringing it out. The FBI man ferreted out this thing himself and told me about it. It has to do with the numbers in the last sentence.

The CHAIRMAN. You mean—

Dr. ZINN. The 7.3 percent business, which is not the enrichment, by the way, if anyone wants to know.

The CHAIRMAN. Doctor, on your own responsibility, can you not—

Dr. ZINN. I believe I can discuss it without revealing classified information, sir. I understand that the reason for not putting this in the record is that you do not do that with FBI reports.

Mr. VOLPE. It is not because any of the information is classified.

The CHAIRMAN. I see.

Dr. ZINN. I can discuss the figures I want to.

The CHAIRMAN. I presume that you have a Commission report on this, your own report, which was made up after you received this information.

Dr. ZINN. Yes. You see, the FBI took the bottle away and took it to Washington and put their experts on deciphering the label, and that is what we got back. I have not seen the label since the day—

The CHAIRMAN. Perhaps I should read at this point what the Attorney General wrote me today and see if this does not contain sufficient information for you to make your point:

MY DEAR MR. SENATOR: Please be advised that Special Agent W. Rulon Paxman of the Chicago field office of the Federal Bureau of Investigation was present on May 25, 1949, during the search of waste material at the site A dump of the Argonne National Laboratory, Chicago, Ill., which search was being made by workmen assigned to the Argonne National Laboratory.

Special Agent Paxman observed the recovery from the waste material of a 1-pint Ball mason jar with a two-piece screw cap and which bore a label containing the notation "284.0 grams," and "U-308."

On May 26 Special Agent Paxman was present at the Argonne National Laboratory when Dr. Winston M. Manning, director of the chemistry division, Argonne National Laboratory, removed from the inside of the jar residue which had clung to the inside of the jar. This residue was placed in solution by Mr. French T. Hagemann, senior chemist, Argonne National Laboratory.

Kindest regards,

Sincerely yours,

TOM CLARK, *Attorney General.*

Is that sufficient?

Dr. ZINN. No. I think to complete the story on why we are absolutely certain that this is the bottle, more must be said about the numbers on the label, and it does not reveal classified information.

The CHAIRMAN. Doctor, tell us what was found. What was reported to you as being found, if it does not reveal classified information?

Dr. ZINN. It does not. I might interpose here that the bottle was really opened by French Hagemann, who is here. He had difficulty getting the cap off. It is, I believe, a valid point to make that the rubber gasket had welded itself to the lid and the bottle. It had to be pried off. This is all known. The FBI observed this. So this bottle was not loosely closed. It was really tightly closed.

But I would like to continue. The number 284.0 grams exists on a transfer document and, of course, I have a copy of it right here, a transfer from Mr.—I will not read the names—but a transfer from the metallurgy division to Mr. Fields, the chemical analyst, for analysis, and it was transferred as 284.0 grams; and then there was another item.

Mr. Fields later on transferred it back to him after he had made his analysis, and here is his document giving 289 grams as the weight. This is quite understandable because he got two items and he consolidated them. The weight went up. There are the figures: 284 and 289.

I was there when Mr. Fields said, "That is my handwriting." He identified it. Mr. Paxman made strenuous efforts to find who had written the other numbers. He still is trying, I believe, to make sure he knows each letter and number.

That day, May 26, he did not succeed, because then the bottle was taken to the chemical laboratory to get the material out of the inside; but he came to me the middle or late next day and said, "I know who wrote the other number. I found the man today who said, 'That is my handwriting, I wrote that number.'" That man is Mr. Dunsworth, also here today. I have never talked to him on this subject. I have just Mr. Paxman's word for it.

I also have Mr. Paxman's word that Mr. Dunsworth says, "I remember oxidizing some material."

The committee will remember the last time we spoke of the material not being in an oxidized form, but the chemical analysis found it to be oxidized. Mr. Dunsworth now remembers it being oxidized, and it would be natural for him to weigh the material and write the weight on the label. He has identified his handwriting.

You will find on the other numbers the gross weight of the filled bottle, which weight is checked.

Senator HICKENLOOPER. Will you tell me the name of the man who now identified his handwriting?

Dr. ZINN. Two men, Mr. Fields and Mr. Dunsworth.

The CHAIRMAN. They are both here.

Dr. ZINN. They are both here, sir. I did not do the questioning. The FBI did. I was a witness when Mr. Fields did this. I never have talked to Mr. Dunsworth about it. I have Mr. Paxman's word for it. He told me he knows who did it and gave me the name.

Senator HICKENLOOPER. All right.

Dr. ZINN. The tare weight of the bottle, the weight of the empty bottle, is written on there, and that is right also.

In other words, the figures on the bottle, you will find, all jibe with the two net weights, the 284 and the 289, and anyone who wants to sit down and go over this can do it.

Now, there was one other notation on the bottle which puzzled us. It was only partly legible. You could see 7.3 percent and written right after it U-308. I would like at this point to point out that this bottle was almost not found. The men who were doing the work in the vault picked up this bottle and saw U-308 on the label. That was legible. They looked at it and did not think it was the bottle, but one said, "Maybe we ought to speak to Mr. Paxman," who happened to be standing nearby. Mr. Paxman, not having on a gas mask and not being dressed in rubber clothes, was in better position to inspect it. He said, "Oh, we ought to keep this bottle." He was really the man who held it.

I might point out he found the bottle the middle of May 25 and still had it and had not done anything about it by the middle of May 26. He was uncertain about it, partly because it was really quite illegible still on the 25th. It dried out. 7.3 percent, followed by U-308. We knew this was not the enrichment, 7.3 percent. What could it be?

Mr. Paxman went around and talked to various people, trying to figure this out, and came back to me, I don't know just what day, and said, "I have a very logical and reasonable explanation of what this 7.3 percent, U-308 is," and I said, "What is it?"

When he had completed telling it to me, I said, "There is no question that your explanation is a valid one." If I may, I will try to give it here.

The analyst, Mr. Fields, who had analyzed the contents of this bottle, had determined that of the material called U-308, 82.3 percent was uranium element.

Now, I must tell the committee that if you have really pure U-308, the percentage of uranium element depends on the enrichment. If it is normal material, the enrichment is—and, by the way, any chemical student can figure this out, if it is normal material, not enriched—the percentage which is elemental uranium is 84.77, or 84.8.

If it would be pure uranium, 235, it would be 84.6-something. It is a custom among chemists, and so on, who handle these materials that when they are handling enriched material, no matter what the enrichment, to use 84.6 and not 84.8, they tell me.

If you take 82.3, which was measured in our laboratory by the analyst, and divide it by the 84.6, you get 97.3 percent of U-308. That is a correct description of the material in there. It is U-308 having 97.3 percent of the theoretical value of elemental uranium.

All the chemists, and so on, to whom this has been explained, agree this is a very reasonable explanation.

I would have to add that 82.3 percent elemental uranium in uranium oxide is no standard thing. It pertains only to the material in this bottle. If you just take uranium oxide anywhere in the laboratory, you can get numbers ranging all over the scale, depending on how clean it is, how free from foreign contaminants, up to the theoretical value.

This rather involved technical point to me is a very convincing one, even though the "9" has to be imagined in front of the "7."

The label at that point was actually—and I think it can be seen on the photographs made at that point—the label is actually torn so that "9" was not visible.

There are some other points I would like to make in connection with the identification of this bottle. I had asked from Washington here that the vaults, the dry active waste vaults of November 1948, be examined. Mr. McConnell, in charge of our reclamation service, who is here today, said on the day Mr. Borden and Mr. Heller were there, that he had records showing when material was taken from this room and put in that vault. He keeps complete records. We did not ask him for his records then.

Senator HICKENLOOPER. Dr. Zinn, do I understand you correctly to assume—I am not objecting to your assumption one way or the other—but do I understand that you are assuming there probably was a "9" in front of the "7"?

Dr. ZINN. Yes, sir.

Senator HICKENLOOPER. Is it possible that there might have been a "1" in front of the "7"?

Dr. ZINN. Anything is possible, but—

Senator HICKENLOOPER. I am talking of certain other records and assumptions that at least appear in the file that I have.

Dr. ZINN. I do not know of any number in this business which has 17.3 percent connected with it at the moment, but I have not searched through to find such a number.

Senator HICKENLOOPER. May I show you this document right here, which will illustrate the point I am inquiring about? The last paragraph.

Dr. ZINN. It says, "may be." Certainly, it may be. I might say that the FBI agent is convinced that if it is anything, it is a "9." He is the man who in conversations with the various scientists in the laboratory dug up this thing of the 97.3. I think it was a rather good feat of deductive reasoning.

By the way, he is a mathematician by training.

Senator HICKENLOOPER. I will not pursue the point further at the moment, and I do not dispute what the FBI agent told you, but it is my understanding that the FBI is not convinced that it was a "9."

Dr. ZINN. All I can say is, What reason do you have for saying it is a "9"? I have tried to give you the reason, sir. Otherwise, it is just a guess. It can be a "3," "8," or anything you wish, but you have to connect it, if you can, with the other numbers in this case. The 97.3 connects in a very good technical, I think, way.

I would like to go back to the vault in which this bottle was actually found. It was found right near the bottom. The agent tells me that he saw them take it out right within this far of the bottom of the box, and the box is 6 feet deep. It had been thrown on its side in order to make the job possible.

We asked Mr. McConnell for his records of collections of materials for that vault. I have the record here. It shows that from the metallurgical site, where we have every reason to believe this bottle was, collections were made on November 23, 24, 26, 29, and 30, 1948, and on December 1 down to December 13, 1948, and then ceased.

This fits in with the fact that it was at the bottom of the vault, and the last week in November of collections from that site were the ones which went into the bottom of this vault. It seems to me that gives you a strong feeling that it was picked up by the Reclamation Service and was put into this vault in November when the collections were made.

There is another small ancillary bit of evidence I would like to present, Mr. Chairman, which will bring out something of our problems. I have a record here which shows that last fall this building, the metallurgical laboratory, was given one of the most thorough house cleanings any place ever experienced. The reason for this was the following:

It has been published that beryllium and its compounds presents a very considerable health hazard, not a radiation hazard, a toxicity hazard. Our laboratory was instrumental in determining this fact by experimental work on animals; I hope none on humans by accident.

This laboratory was used a great deal during the war for beryllium work and even since. There are ways of detecting beryllium dust in the air, and so on. Last summer our Medical Department received from the Commission offices in Washington a clear statement of tolerance levels for beryllium in a place of work, either in the air or on desks, and so on.

Examinations were made of this laboratory and, true, it was not found that they were above tolerance, but beryllium contamination was found on the pipes—this is a big place—and beryllium had been extensively used, mostly during the war. It was decided that very special efforts should be made to clean. A special crew was set up. Here is their schedule of cleaning.

They worked 7 days a week. They cleaned four rooms on September 29 to October 5, 1948; a balcony on October 6 and 7; but they worked continuously from November 5 to November 30 and then the first 4 days in December cleaning the building. There was, therefore, during the period which I am convinced this material was emptied out of the bottle, a real house cleaning in process.

I did not know this when I was before the committee before. These things are infectious, I think, and this lends credence to the idea that some man who did not know there was enriched material there—as a matter of fact, after September this laboratory was convinced it did not have, that it had shipped it all out—found a bottle with oxide in it and said, "Well, we are cleaning up," and disposed of it in the metal recovery can. I think this is merely substantive evidence that should be in the picture.

This, so far at least, represents my story on the identification of the bottle. It is on three things: It was in the right dry active waste vault; the records show this as having been emptied during November in the metallurgical laboratory; it has on its label "identified numbers" and witnesses who testify to their handwriting and numbers related to the records, three of them; and it contained inside enriched material,

which unmistakably has been measured to be of the right enrichment.

To me this is conclusive evidence. By no accident, by no fortuitous circumstance, could these things have happened. I believe that any jury having such evidence presented before it would convict a man if that was what was involved. It would convict him perhaps of his life. It is strong evidence.

The CHAIRMAN. Is it, beyond a reasonable doubt, Doctor, in your opinion?

Dr. ZINN. In my opinion, it is beyond any reasonable doubt that this is the bottle.

The CHAIRMAN. Why do you not complete the picture?

Tell what the results are from Oak Ridge as far as you have got them at this time.

Dr. ZINN. The results so far from Oak Ridge—and, actually, to some extent Dr. Thiele is, so to speak, the general supervisor over what happens in this connection; because we want him to be satisfied; he has access to everything that is going on. We have only one letter on the material in the metal recovery drum, and this letter, which I had here last time, was delivered to us around May 18 or 19 and says that they have actually recovered 27.31 grams and that the error involved is probably another 1.3 grams, plus or minus.

Our analysis of what was in the bottle—and I could go into that in detail, but I have already done this, and it has already been confirmed by further measurements—indicates that very probably there were 30.80 grams in the bottle originally. This leaves a discrepancy of 3.49 grams.

Now, I believe there were some points in connection with the recovery of the material that were not completely satisfying, and these are being worked over by Oak Ridge. They have not given us any answer. We have gotten one thing from them, which was suggested by Dr. Thiele and which just arrived, really, yesterday morning, and that is a sample of the solution that they had made out of the material in this metal recovery drum.

Well, just as soon as we get our hands on such a sample, naturally we put our laboratory to work to check. This is only 1 night's work, of course, and everybody must understand measurements are subject to error, whether made at Oak Ridge or Argonne or anywhere else.

They find—and I think this enrichment is perfectly safe to mention—they find now that the enrichment in this metal recovery can is 1.33 percent. We find 1.40 percent with a method and techniques which are every bit as precise. We would like to see it checked by them, the actual sample that we had.

This would, of course, account for another  $1\frac{1}{2}$  or so grams. I merely mention it to show that trying to account for a small amount of enriched material in a very large amount, something like 22 or 24 pounds, as you will recall, of other materials, not all of them being uranium, is not an easy job.

The Oak Ridge people have been given a tough job, and it is difficult for them to ascertain certainly that they have precisely all of the material and precisely, with a certain accuracy.

Senator HICKENLOOPER. Mr. Chairman, I may say that when we met with the Oak Ridge people, it was my understanding that they were very confident, indeed, based on a long history of similar

analyses that they had run there on these things, that their analysis was very, very accurate.

Dr. ZINN. Yes, Senator, their analyses with mass spectroscopy. When you try to recover metal from a waste recovery container, each operation is a new one, because the kinds of chemicals that are in there are different; so you cannot have a long history of recovery from different samples of different enrichments, and so on. I am not saying that I have any proof to show that the Oak Ridge analyses are wrong. I am merely trying to point out that they are difficult and to say that as a result of measurements that have been made so far, we definitely know that 3.4 grams are not accounted for is, to my mind, not really valid.

Neither can I say they are accounted for. It is being worked on. Eventually, errors will be put on these things, and it will rest there.

Senator HICKENLOOPER. With their experience of 1.3 percent, plus or minus error—

Dr. ZINN. It is 1.3 grams and 27 grams.

Senator HICKENLOOPER. 1.3 grams, plus or minus, so there could be, according to their figures, 2.19 grams missing or, just as easily, 4.79 grams missing.

Dr. ZINN. That is the way it is with errors, sir.

Senator HICKENLOOPER. The error could work either way?

Dr. ZINN. It is not a valid expression if it is not fair. It must work either way.

Senator HICKENLOOPER. So it is just as fair to say there are now 4.79 grams missing as it is to say that there are now 2.19 grams missing?

Dr. ZINN. Neither is fair.

Senator HICKENLOOPER. I say it is just as fair.

Dr. ZINN. No; neither is fair. What you must say is that the probable value is 3.49 and plus or minus 1.3 is the possible error. One does not put the top and bottom limits on and say, "It is this or that."

Senator HICKENLOOPER. Except, Doctor, that in a report to us, apparently minimizing this loss, the margin of error was taken on the favorable side, and it was not indicated on the unfavorable side.

Dr. ZINN. This would not be unnatural, would it?

Senator HICKENLOOPER. I just wanted to make it clear.

Dr. ZINN. In connection with a material that is under recovery at Oak Ridge, I would like to make one more point. When we were here before, the question was raised, Is this material nonradioactive in the sense of, is it just normal uranium activity? Which is a well-known thing.

The Oak Ridge people said at that time their measurements indicated it was straight, normal; meaning no fission products in it, no enhanced radioactivity.

Our laboratory, which has much more experience than Oak Ridge in this, on the basis of the sample received from them yesterday, can report absolutely there is no enhancement whatsoever of the radioactivity. This is normal uranium. It does not have, so to speak, fission products in it, or does not have radiation in it which we could ascribe to fission products.

Senator HICKENLOOPER. Normal uranium, enriched with U-235?

Dr. ZINN. Yes; but that does not change the radioactivity appreciably. Yes; the kind of radioactivity I am talking about is the kind you would get if you had irradiated material.

Senator HICKENLOOPER. I understand.

The CHAIRMAN. Doctor, are you now convinced by the tests so far as they have gone that the three point—what is the figure?

Dr. ZINN. 3.49.

The CHAIRMAN. 3.49—

Dr. ZINN. Grams.

The CHAIRMAN. Grams. Can you give us, as simply as you can, where you think that 3.49 grams is? What is your theory?

Dr. ZINN. Well, I cannot admit to owning a theory. There are several points that might come up. Suppose this remains as an unaccounted discrepancy. You will always wonder about them. We have two ways of establishing the enrichment of the material in the original bottle, and they agree.

One is the small analytical sample, which our analytical chemists retain as the analytical laboratory's evidence. This gave a certain enrichment of—well, you remember what it was.

The material that was recovered from the inside of the bottle gave the same enrichment by our analysis. It is too little for Oak Ridge to analyze. They need a larger sample. But we have done it in two ways, and it is very clear that it is the same sort of material.

This enrichment shows that the material in this bottle had been diluted by some normal uranium during the machining operation, which I went into in detail.

Two other samples were recovered from the machine at the same time as the material in the bottle and their enrichment has been measured by Oak Ridge and also by us, and they agree. It is considerably less.

Now, I believe actually that what we are taking for the enrichment is the right one, but I will always be puzzled by the fact that the coolant stream and the stuff on the filter paper really showed considerably more dilution. You can see there are reasons why that would happen.

The coolant went around through the machine and could have picked up any normal uranium hidden in a crack or cranny. It had been used for normal uranium work. You can justify it that way.

I pointed out there was a small decrease from what we supposed was the normal enrichment of the material in this bottle, which would wipe out the remaining discrepancy.

The other thing I am concerned about is the fact that if you are trying to recover from a fairly large quantity of heterogeneous stuff, that it was not all uranium—I have the microscopist's report, which shows there was sawdust, for instance, in this metal recovery drum. We know how that happened. If you are trying to pick up a mixture of uranium oxide and other water from a floor with a vacuum cleaner, the simple thing to do is sweep in sawdust or floor-cleaning compound, and you have a solid to soak up the water. You want to get the place clean. This was known to have been what was done if you have this sort of thing to do.

They have a recovery job from a fairly nasty substance. It involved, as you recall, calcining a good slug of it in a furnace at a high temperature. I do not know whether or not some of it did not leave and go up the flue. The supposition is that it did not.

Senator HICKENLOOPER. Again, Doctor, at that point, did not the Oak Ridge people say that they had checked historically and repeat-

edly many, many times on flue recovery and that they were quite sure that they lost none in that fashion?

Dr. ZINN. But they would not say that it was not possible that they had lost some.

Senator HICKENLOOPER. But their experience had shown, with repeated checks and analyses, to their satisfaction, that they were not losing any in flue—

Dr. ZINN. Correct, sir, but we here surely should not be surprised if some unusual things happen in this business.

Mr. DURHAM. What degree of heat was used, Doctor?

Dr. ZINN. One gentleman said something like 800° C., and he was corrected by another one who said 500° C., which is almost red hot.

Mr. DURHAM. Red hot?

Dr. ZINN. Yes, sir.

The CHAIRMAN. You see, Doctor, without any intent to impute the theory to Senator Hickenlooper, there are those who cling to the theory that some spy ran away with this 3.49 grams. What comment have you got to make on that?

Dr. ZINN. I just cannot understand how the various things that I have related would fit into a picture of a spy running away with a bottle. First of all, we have no evidence whatsoever, and the FBI has never told me about any evidence of anyone getting past the guards anywhere in our buildings, and no evidence that the vault, and so on, was broken into. There is none of that.

Now, suppose it was an inside spy—and I would be extremely anxious to ascertain this, and so should the FBI—why would he dump the stuff, the most of it, into a metal recovery drum? Because if he was an inside man, he would know that that meant the stuff would be lost without trace. It would vanish. And then why would he very carefully put the bottle where it ought to go, into a waste recovery can and then only keep a little bit of it?

If he was going to risk really his life in stealing something and have the rest of it vanish without trace and put the bottle in a place where it might have been found, why did he just take a little bit of it?

The CHAIRMAN. This is approximately the amount, without identifying the bottle, this is approximately the amount in question. Your point is: Why, if he had this amount, would he pour all but 3.49 grams in a can and take the 3.49 grams?

Dr. ZINN. If it is all right to suppose what an informed and clever spy would do—I do not know whether it is a good thing—to me, it is very obvious what he would do if he had an opportunity.

I do not know whether this is a good thing to do in open hearing—how he could cover his tracks without going to this sort of trouble.

The CHAIRMAN. I do not think you need go into that.

Dr. ZINN. There is a much simpler way of making it very difficult to ever know that something funny had happened, and an informed person, it seems to me, who knows as much about the business as this person apparently did, if the supposition were at all true, I just do not understand why he would do it.

Senator HICKENLOOPER. Mr. Chairman, as long as we are discussing the theories of theft, I may say there has been advanced to me by one, two, or three people this possible theory: That if anyone wanted to surreptitiously remove 3 or 4 grams of this enriched ma-

terial for illegal purposes, it might be perfectly natural procedure for him to take a little bit out of it, dump the rest of it in the waste can, put the bottle where it was normally supposed to be, with the belief that he could get away with the 4 grams, let us say, feeling that a check would disclose the missing bottle and have it found in the waste recovery can, the bulk of it, and the bottle perhaps eventually found, and people say: "That is the explanation for it."

Meanwhile, he could take his 4 grams and go wherever he wanted to with it, and rely upon the fact that such an explanation would be forthcoming, most of it would be considered to have been recovered, and the 4 grams would be considered as lost some place in the dumping process.

I do not say that is what happened, necessarily, but it is, I submit, a theory upon which some espionage agent or someone wanting to do that kind of a job would feel that his backtracks had been thoroughly covered by a perfectly plausible explanation for the disappearance of it, with the exception of 4 grams, which probably would be attempted to be minimized greatly.

Dr. ZINN. I cannot agree, Senator, that that is perfectly plausible. Imaginable, perhaps; perhaps a little on the fantastic side.

Senator HICKENLOOPER. If he took the whole bottle, and it completely disappeared, there would be more of a hulabaloo, would there not?

The CHAIRMAN. I doubt it.

Mr. PRICE. How could there be?

Dr. ZINN. Let me try to show what I think is weak in your argument. Perhaps I will have to give what he really would have done if he had any brains at all.

The weakness in your argument, Senator, I believe, is this: That putting it in the metal recovery drum normally should have meant that we never could have found that stuff. It was only because we were holding an exceptional number of these metal-recovery drums for shipment that we still had it. Otherwise it would have gone to Philadelphia. Why were we holding it?

We explained before that the Metallurgical Division had been scheduled to move from its place in the city of Chicago out to the country site, 27 miles away, about January 1. The idea was that when you move, you get an extra amount of recoverable material. That is, I think, quite understandable. You take all the machines down, you move all the things away, and you find things, and, therefore, the AEC people, who were holding these drums involved in the shipment, said, "Let's hold them until we get Metallurgy moved."

Otherwise, they really would have shipped them out a couple of months earlier, and we would not have had any chance of making this analysis. Therefore, I think if someone wanted to put it in a place where it would be discovered, he put it in a wrong place. It would be a remarkable person who would know that in the Special Materials Department some place in the AEC there was a man who said, "Let's not ship now; let's hold until Metallurgy gets moved."

I really know that there is something that could have been done which is much simpler and much more logical to cover tracks.

The CHAIRMAN. Doctor, the FBI has reported to you that in its opinion there is no espionage involved in this matter?

Dr. ZINN. I have asked this question, and I have been told it can find no evidence of espionage.

The CHAIRMAN. On the other hand, the tests that you have told us about, in your professional opinion are such as to make entirely feasible and possible the facts that this missing portion is involved in laboratory work and in the errors that can be anticipated in processing this material?

Dr. ZINN. I believe it is entirely possible. I have not got evidence to prove it. I think it is a difficult matter. Matters of checking down detailed inventories whenever you have a complicated situation like this are always tough. There are many such tough situations in the inventorying and analytical work throughout our operations.

The CHAIRMAN. Doctor, many people cannot understand why it is so difficult to keep an inventory on materials. Many people have the idea that it is like money. You put it in the bank, you count it, the teller counts it, he receipts for it, and it is perfectly identifiable.

Now, will you give us a brief explanation as to the difficulties involved in the inventory process?

Dr. ZINN. There is only one way, sir, of keeping your material so that the number you carry on your book stays a constant number, your wealth, so to speak, is always the same, and that is to put it in vaults and never touch it. Do not do any work with it. Whenever you do work with it, you get into uncertainties in your inventory.

Let me, please, give an example. I think this is a perfectly legitimate example, and it is one that is involved in our inventory analysis. Dr. Thiele knows all about it.

It will take me some minutes. I think this is a good example of the type of problem that we run into when we try to account for all of this stuff all the time. For some very important work that our laboratory is doing—

The CHAIRMAN. You have about 2,200 people in your laboratory?

Dr. ZINN. Yes, sir; 470 scientists. For some very important work that our laboratory is doing we require fabricated certain metallurgical specimens. The Battelle Memorial Institute in Ohio has devoted quite a lot of effort under contract with the Commission to finding out how to manufacture these metallurgical specimens. They do their work on normal uranium, of course.

Some time this winter, I do not know the date, they announced and showed us that they could make some materials, these specimens, using normal uranium. So then we said, "Now, to carry on our work we need some things like that, a dozen of them, made with enriched material. Will you undertake it?" They said, "Yes, we will undertake it."

There are certain problems. I will come back to those problems.

We arranged to have shipped to them from the stock pile a certain quantity of enriched uranium. They used this to fabricate a dozen of these objects. Now, they received a certain amount of enriched uranium into their laboratory. That is known, a certain enrichment. They shipped to us the dozen objects they made, plus five other lots of material: The machine turnings, certain powder debris, some floor sweepings, wiping rags, some wash solutions, a whole mess of stuff.

They have done their very best in this operation to recover every bit of it. They sent us the finished articles; they sent us all the debris, so to speak, connected with it. It is six or seven items.

We got a slip of paper that shows the amount of enriched uranium in it that they received. Nobody knows if this is true. How do you find out if it is true?

Well, of course, you take the wiping rags, the cleaning solutions, the chips, the powder, the floor sweepings, and you send them to Oak Ridge and ask them to process them and recover uranium; and they are down there now being worked on.

But you still will not know where you are because how much is there in these materials that they fabricated for us? If you dissolve those to analyze them, then you have lost what you made.

Senator HICKENLOOPER. Doctor, if I may interrupt, the bottle at Chicago had gone through the process of recovery, as I understand it; a certain amount of oxide was in the bottle in weight. There were no rags involved, no machining process—a certain amount of material in a bottle.

Dr. ZINN. I am now trying to answer the chairman's question.

Senator HICKENLOOPER. From this bottle content, as certified, a certain amount has disappeared, granting the correctness of the theory that the material itself has been located, the bulk of it; so that there would be no processes involved in the disappearance of the amount of material from here.

Dr. ZINN. That is not what I was talking about. I was talking about the processing of the material in the waste-recovery drum, which is a recovery operation. I am trying to answer the chairman's question about difficulties in inventory.

Senator HICKENLOOPER. Excuse me.

Dr. ZINN. These dozen metallurgical samples cannot be analyzed now without destroying them. Let's see what is going to happen with them.

They are scheduled to be irradiated in reactors. They will become very extensively radioactive. During their irradiation certain measurements will be made of them. Subsequent to their irradiation, while they are still single objects, they will have other measurements made on them in apparatus which is shielded with many feet of concrete.

We still will not have a complete inventory. The only way we can do it is to irradiate these materials, then allow them to cool to a point where chemists can conceivably work on them. This will take years, we will never be able to balance the books on that operation—namely we will never know what we have to write down for a loss in this fabrication, which I mentioned, until these elements have been irradiated, have had their measurements made on them, have been allowed to cool for a few years—that is, the radioactivity decayed—and then they can be dissolved and analyzed, and you can close the books on that operation. You cannot close the books now.

And if during the metallurgical fabrication somehow or other a small amount of material was purloined, we do not know it now. We cannot know it without destroying that experiment now. We have to go on for several years before we can close the books on that operation. If we cannot do that, we cannot do any work. There is no way of doing it.

This happens over and over again, sir, in work with these materials. This is why the work is carried on behind barriers, behind guards. This is why people are cleared; this is why FBI clearance is required of people. Because if you cannot have people who you are confident will not do this filching, let us say, your inventories cannot control the situation because of the sort of thing I have just mentioned.

Senator HICKENLOOPER. I think that is very true, Doctor, and I agree with you, without being a scientist.

Dr. ZINN. Mind you, I am not trying to ascribe this as an explanation of this.

Senator HICKENLOOPER. I suggest, because there are those factors in other processes you have described, the degree of security in this project, therefore, should be maintained at all times to the highest possible level consistent with getting any work done.

Dr. ZINN. I believe, sir—

Senator HICKENLOOPER. It is for the reason that you may not be able to detect these things for a long period of time that the sanctity of the security system must be high indeed.

Dr. ZINN. I agree completely.

Senator HICKENLOOPER. One other question.

Doctor, four grams of this material with the enrichment that it had is an important sample for scientific investigation; is it not, that amount?

Dr. ZINN. I believe I gave a statement on that last time. If you want me to repeat it, I will do it. It has, of course, some importance.

The CHAIRMAN. This is not classified?

Dr. ZINN. I will avoid anything classified.

Senator HICKENLOOPER. The point I want to get at is this: I think we have gone through the fact that it has importance in research in certain fields. Four grams, in fact, of this particular material enriched, to all intents and purposes, is just as good as 30 grams, is it not, except that 30 grams is more than 4 grams and there might be certain mass use of it that would be helped by having 30 instead of 4, but 4 grams is still a substantial amount; is not that correct?

Dr. ZINN. I do not believe it is a critical amount at all, sir. I believe if you are thinking of someone who is in the business of making, let us say, atomic weapons—and I think I tried to describe this before, I cannot go into the detail I went into before—in my opinion—and, mind you, I am not an expert; I explained once before to you I did not work in the Weapons Department during the war, I was in the reactor field almost entirely, but I made many measurements, and many of the fundamental measurements, in this business.

There are certain small amounts which I mentioned once before which do you some good. There is in between a gray region where you do not get very much more for your efforts. There is, finally, a point where if you have that amount—and it is very considerably different from what you are speaking of—it is of considerable help.

Senator HICKENLOOPER. But when we started in this project, we had an infinitely less amount of this particular material.

Dr. ZINN. Yes, and I would like to point out we made a chain reaction, which was a very important thing in this business, without ever having seen any enriched material, never having laid eyes on it, never had it.

We, at Argonne, got the first enriched sample that came along and we used it with the chain reaction to make some measurements.

Senator HICKENLOOPER. Do I understand that 4 grams or 32 grams of this enriched material is not very important then?

Dr. ZINN. I will not say it is not very important. I will say it is of some importance. I will say I do not believe it is of critical importance, and I also say, if you are talking about weapons development, you are talking to the wrong man.

Senator HICKENLOOPER. I am not talking. Everybody, I think, is fully aware that 4 grams or 32 grams will not make an atomic weapon. That has never been——

Dr. ZINN. That is not what I am trying to hint at, sir.

Senator HICKENLOOPER. From the standpoint of research and experiment, for whatever answers material of this enrichment could give to a research person, four grams is important; is it not?

Dr. ZINN. It is of some importance, yes.

Senator HICKENLOOPER. And to all intents and purposes, for the answers it will give, is it not about as important as 30 grams would be?

I mean the mass of the grams would make little difference in giving the research answers.

Dr. ZINN. I do not believe I want to get into a discussion of where it becomes important, because this then gives my opinion, and I do have one, based on some experience, what amount would begin to make certain measurements, certain measurements which I have in mind, measurements that actually I made one time, and I do not think I want to get trapped into that one.

Senator HICKENLOOPER. I do not want to push you too far in that detailed field, but it seems to me the physical facts of the tremendous effort that has been put forth to try and solve this problem indicates that it is a matter that is considered of some serious importance. Otherwise, there would be no use whatsoever in going to all this trouble. It would be said, "It is of no importance whatsoever, and it is gone; so what?"

It seems to me the physical effort that has been put toward the solution of this matter is probably a great indication that it is considered to be a matter of some importance.

Dr. ZINN. This is so. I think the Senator should realize that, as time goes on, the amount of material which you would consider important really gets larger. We cannot expect that other people do not somehow or other, and by well-known means, begin to make some of these materials themselves. At some stage of the game we must be careful that we are not trying to, so to speak, do all this effort, and so on, to protect too little.

Senator HICKENLOOPER. Let us say in 1942 or before piles were developed or other separation processes were developed, we would have given a lot for 4 grams of enriched uranium; would we not?

Dr. ZINN. In my opinion, we would have given a lot more for numbers which tell us how to make the 4 grams. That is much more important. Just 4 grams without the possibility to make all the other grams of enriched material that you are interested in; the measurements do not tell you how to make it, sir.

Senator HICKENLOOPER. That is very true, but measurements give you physical proof of the correctness of your theoretical number; do they not, very often?

Dr. ZINN. Yes, that is why you use measurements, but the point I was trying to make is that just a certain amount of material while of interest would not be nearly as important as the knowledge as to how to make it.

I would like to point out—and I think I did before—that if we are dealing with espionage, certainly, we have to worry about the materials. I worry equally, and really much more, about our numbers, the measurements that we ourselves make with these materials. We have skills and ways of making measurements which probably are not current other places, and numbers when they leave do not leave any trace, and so on.

Senator HICKENLOOPER. In making the numbers from the measurements of the material, someone else with a certain degree of skill along this line could probably develop numbers from the materials after they had received the materials; could they not?

Dr. ZINN. Of course, that is—

Senator HICKENLOOPER. Of course.

The CHAIRMAN. Doctor, I have some photographs that were classified at the time they were taken because, as I understand it, it was previous to the bottle being examined. They are pictures of the operation and also pictures of the bottle that was recovered. I will show them to you and have you identify them.

Dr. ZINN. Yes; this is the object, the bottle.

The CHAIRMAN. Now, looking at that picture, Doctor, the picture of the bottle, is the size of the real bottle as opposed to one that was brought in as an example about the same?

Dr. ZINN. I would say it is about as tall as the lower edge of the cap on that bottle, not quite as tall, a half-inch shorter, the diameter about the same.

The CHAIRMAN. White instead of brown?

Dr. ZINN. It has white glass instead of brown glass.

The CHAIRMAN. Is the bottle pictured there one that is in common use?

Dr. ZINN. Yes; they are frequently used because they have a nice tight cap. The cap is a sheet of steel which has been enameled on the inside, and then a rubber gasket fits underneath there, and with the cap screwed down it makes a nice closure, and it is a clean bottle because of the enameled inside, and it has a wider mouth than that, and it is an easy bottle to clean. They are frequently used. They are available in the stock rooms.

The CHAIRMAN. Where is the bottle now; do you know, Doctor?

Dr. ZINN. I do not know first-hand. For a while the FBI had both the bottle and the cap. There was a fingerprint on the inside of the cap which they were not able to do anything with. They returned the bottle to the AEC at one stage of the game, and I have heard but I do not know actually, that they returned the cap perhaps also. They are through with it. I have not got it.

The CHAIRMAN. Is the bottle in the possession of the AEC?

Mr. VOLPE. Security officer.

The CHAIRMAN. Is there any reason why it cannot be produced?

Mr. VOLPE. I am told it is in Chicago.

The CHAIRMAN. In whose possession?

Mr. VOLPE. The security officer.

The CHAIRMAN. You mean the AEC security officer?

Mr. VOLPE. Yes, sir.

The CHAIRMAN. At any rate, we do have some pictures. There is no objection, as I see it, to entering these in the record, is there?

Mr. VOLPE. Not from a classification standpoint.

The CHAIRMAN. That is the only point that is involved.

Dr. ZINN. There is perhaps one point. As long as we have not found the hand, as I said once before in the other meeting, that has emptied the bottle, it is a useful object to show to a man and say, "Can you remember it?"

Now, the FBI has been doing this and apparently have covered what they consider to be the whole ground. I do not know.

The CHAIRMAN. I am informed there is no objection to putting the pictures into evidence at this time. If you have no objection, no personal objection, we will do so.

Dr. ZINN. I have no objection.

The CHAIRMAN. May I have them back?

Have you seen these, Mr. Elston?

Mr. ELSTON. No; I have not, sir.

(The pictures referred to above are in the files of the Joint Committee on Atomic Energy.)

The CHAIRMAN. Now, are there any further questions of Dr. Zinn?

Senator KNOWLAND. I have a few.

The CHAIRMAN. Senator Knowland.

Senator KNOWLAND. Doctor, I would like to go back to something on this process of moving the material from the metallurgy plant over to site B and the practices which I think you have indicated in your own judgment now in retrospect seem to have been rather loose practices at the time, and as I understand it, you have taken steps to lock the barn door, so-called, after the horse has been stolen or, at least, disappeared.

Now, in your judgment, with the new techniques that you have put into effect, are you satisfied that the type of a situation that you now find yourself in could not happen again?

In other words, that a man would make up a box and make out an inventory, but actually would leave one or two bottles out of the box. Do you think you have covered that loophole?

Dr. ZINN. Yes, sir; I am convinced we have done it, and I think we have done it in an expensive way too, but a very clear-cut way. The way is this, if I may say so:

Whenever such materials are transferred, even from one individual to another, even in the same building, the same laboratory, it will go through a representative of the source and fissionable materials branch, who will be stationed there. The man releasing it, so to speak, will make out his document. It will be audited at that moment by this fellow, and he will have to put down his complete audit. The audit will include tracing that sample back to its inception through a certain set of numbers which are assigned.

He then will transfer it on courier receipts, and if it goes outside of a guarded area, it will be by courier with armed guard, and so on, with receipts all along the line.

When it is received by the other man, there will be the source and fissionable material representative there, who will audit the package, read the numbers, the packages are being sealed with a special device with serial numbers, he will audit it and release it to the other man. This, of course, means we have to have a trained man in every place where things can be transferred. Since, as I explained last time, our laboratory is rather dispersed, this means we will have a rather large number of these trained people and, of course, the expense necessarily will go up, but I think it is entirely justified in view of this sort of difficulty.

Senator KNOWLAND. I can certainly understand the problem that you are involved with in working with this material. It is not like locking the gold at Fort Knox where all you have to do is to put it down in a big vault and with the necessary guards and it is not used, and I think we all understand that in the processing you have got more complications certainly.

On the other hand, I think you yourself have testified that it is necessary to be sure that you have all reasonable security precautions set up. Would it be your judgment that if anyone took any material away, referring now specifically to Argonne National Laboratory, took it away from the laboratory, that that would be a serious offense and should require serious disciplinary action?

Dr. ZINN. I believe so. These people all understand—well, any material property, if we find anyone taking it, depending on what it is, saying they will be prosecuted, and so on—especially the special materials, I cannot believe there is anyone who would not understand that taking that makes them liable to prosecution under the Atomic Energy Act.

Senator KNOWLAND. You would think that not only might it warrant the prosecution under the Atomic Energy Act, but that the event would be of such a serious nature that there would be a prompt removal of the person from his position if he unauthorizedly took material away from your establishment?

Dr. ZINN. Certainly. As a matter of fact, anyone who takes anything from our establishment, we know would be removed from his position. People have.

Senator KNOWLAND. There would not be a considerable delay after that was found out, as far as the Argonne National Laboratories are concerned?

Dr. ZINN. No, sir.

Senator KNOWLAND. I am glad to hear you say that, Doctor. That is all for the present.

Mr. PRICE. Mr. Chairman.

The CHAIRMAN. Senator Vandenberg?

Senator VANDENBERG. No.

The CHAIRMAN. Mr. Price?

Mr. PRICE. Dr. Zinn, earlier in your remarks you made a statement that you had hardly had time to get into this matter before it was a public matter. Could you elaborate on that? Could you tell us to what you refer?

Dr. ZINN. I will try to recall in what connection I said that. Yes, I recall the connection.

In April, around April 12, we saw that we had enriched material in our metal recovery drum, and I was completely in agreement with the

idea of getting it to Oak Ridge and getting them to work, because that is their business, to recover things enriched. We did not get an answer back from them until this letter, which is dated, I think, May 11, but it takes a little time for a classified letter to come through the channels.

I do not think we got that letter until about May 17 or 18 or 19. That is the first time we knew that metal recovery drum had over 90 percent of the material in it that we were looking for. It was only after that that I believe we would have started looking for an empty bottle, because until we knew that the stuff was in the metal recovery drum, the material being in our dry active waste, let us say, did not become a problem, and right after that the roof fell in, so to speak.

Mr. PRICE. Do you refer specifically to any news story?

Dr. ZINN. It came out in the newspaper, yes.

Mr. PRICE. You refer, perhaps, to a specific story bylined by Mr. Jerry Green and Mr. William Bradford Huie in the New York News?

Dr. ZINN. That was the beginning of it, yes, and my telephone started ringing at 6 o'clock that night and never stopped ringing until 2 o'clock the next morning the first day.

Mr. PRICE. Mr. Chairman, Senator Hickenlooper referred to a hypothetical espionage case, stating as his source of information, 1, 2, or 3 people. I would not question the sources of the Senator's information, and I am not concerned with it. He is a member of the committee, and he is entitled to all information he can obtain, theoretical or actual information; but I do question, perhaps, the security violation in regard to the sources of information on the outside that have led to what I consider security violations in newspaper stories and in magazine articles.

I have one article here in particular, which appeared in the Nation's Business, a publication of the United States Chamber of Commerce, in the June issue, 1949, authored by Mr. William Bradford Huie, entitled "Is the A-Bomb Secure?"

I would like to explore some of the statements made in the article, and I think the only way I could do it would be to question the Chairman of the Commission.

I realize that you have set a 1 o'clock limit on these hearings, and I want to cooperate with the committee in every possible way, but I think that the sources of the information contained in this article should be explored by this committee.

The CHAIRMAN. Mr. Price, it is quite obvious to me that when we reach 1 o'clock, that we cannot close this matter because there are several witnesses; they may be brief, but nevertheless, they must be heard. Inasmuch as the Chicago gentlemen are of the utmost importance in this project, I am anxious to get them back to their work just as quickly as possible.

Therefore, if there is no objection from any member of the committee, I would like to proceed this afternoon at 2:30 to continue this hearing. I have consulted Senator Hickenlooper about it a few minutes ago, and he is personally agreeable and has no objection.

If there is no objection, we will proceed at 2:30.

Mr. PRICE. There is no objection on my part, Mr. Chairman, but I certainly would like to explore the statements that are made in this particular article.

The CHAIRMAN. You will have that opportunity later on in the afternoon when we meet this afternoon. Are there any further questions, Mr. Price, at this time?

Mr. PRICE. Not at this time.

The CHAIRMAN. Mr. Elston?

Mr. ELSTON. Mr. Chairman, I would like to ask Dr. Zinn a question or two.

Doctor, I notice that you have guarded very carefully today any statement about the percentage of enrichment of this material and, of course, I am not complaining at all that you are doing so, but I wanted to ask you whether or not the information about the percentage of enrichment is itself a classified item.

Dr. ZINN. Yes, sir. I can give you the reason if you want. I think the reason is perhaps unclassified.

Mr. ELSTON. Doctor, I do not want you to give it if you do not feel you should. Let me ask you whether or not the possession of a single gram of this enriched material would indicate the percent of enrichment.

Dr. ZINN. Do you mean, sir, that on a gram can one make a measurement?

Mr. ELSTON. Yes.

Dr. ZINN. It depends on who you are. In other words, it depends on how good a mass spectroscopist you are. Mass spectroscopy is a science which I would really say the United States is supreme in, in science. A great deal of the work was pioneered in England in the 1920's, but during the 1930's and in the 1940's certain individuals in this country became extremely competent in this mass spectroscopy field. Mass spectroscopy is a very important thing in connection with the enriching of uranium, and so on. I am not going into the details. I do not want to at this time say what amounts our best people, and so on, can make measurements on. I do not want to do it, because the measurements are being made in the project.

Mr. ELSTON. Would you be fearful if three or four grams of this material were in the hands of a foreign nation, that they might be able to measure the percentage of enrichment?

Dr. ZINN. I believe if they have any real competence in physics, they would succeed in doing it eventually.

Mr. ELSTON. Would the knowledge about the percent of enrichment give some indication as to the kind of experiment that was being conducted at the metallurgical laboratory?

Dr. ZINN. No, sir. I might say, if I could amplify that reluctance to start mentioning enrichment, it is not reluctance on my part at all to mention this particular enrichment. Once you start on these things, they have a tendency of cascading, and to begin to mention amounts of enrichment—of course, there can be an infinite number of them from zero to a hundred percent—to begin to do that, I think, is a very poor thing, and I do not want to be the one to begin it.

Mr. ELSTON. I commend you for your policy. I am simply trying to find out whether or not possession of three or four grams would be helpful to a foreign nation.

Dr. ZINN. I think I tried to answer that question when it was asked of me by Senator Hickenlooper. The knowledge that we have, a certain enrichment, the enrichment we are talking about here is not of any great importance to a foreign nation.

The beginning of releasing enrichment from this project, I think, is another matter. Once you start to open up that subject, you are not doing the best in security.

Mr. ELSTON. Doctor, another thing. Was any other material dumped out of bottles besides the material that was in this one bottle in question?

Dr. ZINN. Well, of course, I know you realize that in a laboratory a bottle is the general vessel in which things are kept, chemicals, it is the common article. Therefore, to say that bottles are emptied, of course, they are, all the time.

Mr. ELSTON. I mean bottles that were stored in this vault.

Dr. ZINN. Well, were bottles emptied that contained natural uranium, unenriched uranium?

Mr. ELSTON. Anything stored in the vault.

Dr. ZINN. Yes. The men who had custody of this vault—they do not any more—they say yes, at various times they remember there was a bottle with some uranium oxide in it, normal uranium oxide; the reasonable thing to do with it is put it in the metal recovery drum and to get rid of that sample.

This would not be an exceptional thing to do, because this laboratory, you will recall, please, did not deal with uranium oxide. Its business was with uranium metal, and oxide was the debris.

Mr. ELSTON. When this particular shipment came in, it was an unusual shipment, was it not?

Dr. ZINN. To that department. It would not have been unusual in some other departments, which are not there.

Mr. ELSTON. But to that particular department, it was an unusual shipment?

Dr. ZINN. Yes, sir.

Mr. ELSTON. Unusual material?

Dr. ZINN. Yes, sir.

Mr. ELSTON. Now, were any particular precautions taken to protect that material?

Dr. ZINN. Yes, instructions were given to everyone who handled it to make sure at the end of each day's work it was locked in the vault, the people who took care of the vault actually, I think, were over-instructed; they were told to be very careful; don't touch that material, don't disturb it; and, therefore, they did not really inform themselves sufficiently of what it was. It did receive special instructions.

Mr. ELSTON. Those instructions were not followed, then, were they?

Dr. ZINN. I believe not.

Mr. ELSTON. Was any particular check made of the personnel to see whether or not they could be trusted with this highly secret material?

Dr. ZINN. The people who were allowed to handle it had what we call security clearance, Q clearance.

Mr. ELSTON. I am not going to go into specific cases, as I understand that is a matter which we must go into in executive session, but did you make any particular check of your personnel before turning this highly classified material over to them?

Dr. ZINN. We have no way of making a check, sir. What we get is a clearance order, which says this man has Q clearance. Sometimes this is followed up later on by a letter pointing out that although the

man has Q clearance, there may be some question about his record. We had no such information about any of these people.

Mr. ELSTON. The records of all these persons were in the possession of your own security officer?

Dr. ZINN. In the laboratory?

Mr. ELSTON. Yes.

Dr. ZINN. The FBI records? No, sir; we never see that. The FBI will not allow the contractor to see their records.

Mr. ELSTON. You had other security records; did you not?

Dr. ZINN. I think I must explain, sir, that I think the Atomic Energy Act and the rules of the FBI put the contractor in this position: The contractor cannot and may not go out and investigate people. What you do is have the applicant fill out a job-application form. He gives references. You write letters to his references. You cannot do more.

He fills out a security questionnaire which does not go to the contractor. It goes to the AEC and the FBI, and from them you get back a report saying this man has clearance or he does not have clearance.

Mr. ELSTON. That FBI report on the individual becomes a part of his security record, does it not?

Dr. ZINN. Not in the laboratory.

Mr. ELSTON. Where is it kept?

Dr. ZINN. It is kept in the security records of the Atomic Energy Commission.

Mr. ELSTON. In Washington?

Dr. ZINN. I do not know this first-hand, but I believe that up to a certain time they were kept in Washington; beyond that time they are being kept in the local offices.

Mr. ELSTON. Are they kept in the local offices now?

Dr. ZINN. I believe so.

Mr. ELSTON. At the time this material was missing they were not kept in the local office, were they?

Dr. ZINN. I believe that they were; yes. I do not want to be held to this number, but I think it was about a year and a half or so ago that the records on this sort of thing were transferred from Washington to the local offices. I had nothing to do with this.

Mr. ELSTON. I do not think you did. But at least, your security officer would have the entire file before him.

Dr. ZINN. No, sir.

Mr. ELSTON. If it were transferred from Washington to the local office, then you would have the record, would you not?

Dr. ZINN. The security officer of the AEC, the Atomic Energy Commission, not the laboratory, would have that file.

Mr. ELSTON. You mean the security officer in Chicago?

Dr. ZINN. Yes.

Mr. ELSTON. Well, he works in close cooperation with you, does he not?

Dr. ZINN. Yes, sir.

Mr. ELSTON. And when this material came in, did you make any check of the personnel that was to handle it, any recheck?

Dr. ZINN. No, sir; the people who handled it were Q clearance, and this means they are around the laboratory, they have access to all the restricted areas, and so on. No recheck was made.

Mr. ELSTON. How many persons had access to this material?

Dr. ZINN. Well, the number of people who could, so to speak, go in the vault was always limited to two or three.

Mr. ELSTON. And if anything was taken out for use in the laboratory, they had to leave a receipt for it, did they not?

Dr. ZINN. They had to get it from the vault custodian; yes. As a matter of fact, I think in this case he sort of followed them around and got it back again.

Mr. ELSTON. Now, the vault custodian; is he a guard?

Dr. ZINN. No, sir. At that time the vault custodian in this area was a laboratory employee, not a guard, who had some technical training so that presumably he could do weighing and some figuring, and so on.

Mr. ELSTON. Well, he could have, of course, had access to very highly classified material; is that right?

Dr. ZINN. Yes, sir; and so, of course, would the machinists who did the machining.

Mr. ELSTON. Yes; but the machinist who did the machining would have given a receipt for the material before he touched it.

Dr. ZINN. He probably did not give a receipt, because the vault custodian was probably there when he machined it, brought it to him and watched him do the work.

Mr. ELSTON. And then returned it?

Dr. ZINN. Then, at the end of the day they cleaned the operation and returned the stuff to the vault; picked up everything they could.

Mr. ELSTON. Mr. Chairman, that is all I can ask on that phase of the question in open session.

The CHAIRMAN. All right. It is 1 o'clock, and the committee will recess until 2:30.

(Whereupon, at 1:05 p. m., a recess was taken until 2:30 p. m., of the same day.)

#### AFTERNOON SESSION

The CHAIRMAN. All right, the meeting will come to order.

Some of the members of the committee have been delayed for a few minutes by reason of business on the floor of both the House and Senate, and I anticipate they will be in; some of them that can, will be in very shortly. In the meantime, because of the pressure of time, we will go ahead.

I just want to read into the record at this time a note which was sent by Mary Spargo of the Washington Post this morning to the members of the committee. Miss Spargo says:

So long as this reporter is mentioned—

and you will remember she was mentioned this morning, her story on the bottle—

I tell you we called it the brown bottle, not Senator McMahon. We had previously been told it was a brown bottle by one or another not a member of the committee.

It is signed "Mary Spargo."

I have not as yet checked the notes of the press conference, but I will ask that that be done, just simply to clear the matter up, not that I view it of as any great importance at this time, but simply because we must try and make a complete record.

Senator HICKENLOOPER. Mr. Chairman, just to make the record complete, I do not want to dwell on this point—I hardly called attention to it, but I do call attention to the news article, the news story of June 3, 1949, in the Times-Herald which I referred to this morning, referring to it as a “missing brown pint bottle,” and then it quotes the chairman of the committee further down in the article indicating that that was an interview, and, as I say, this is no censure or even criticism of the chairman.

Then, in the New York Daily News of June 3, 1949, the story in which the chairman is quoted among other things, with respect to the bottle—it does not specifically quote the chairman as saying “a brown bottle,” but it says in the story:

Chairman Brien McMahon of the Joint Congressional Atomic Energy Committee announced late today that investigators have found the missing brown pint bottle which contained 10 to 12 ounces of uranium oxide which vanished from Chicago.

That is in the New York Daily News of June 3.

In the Washington News of June 3, which was written as a result of—that is; following the press interview on June 3—this is the United Press story, and it says in the middle of the story, and I quote:

The discovery of the brown pint-sized bottle cleared up one mystery surrounding the loss of an ounce of uranium in Argonne.

Then, in the Baltimore Sun of June 3, resulting from the same interview is the following:

Washington, June 2—

this is the Washington Bureau of the Sun—

Senator McMahon (Democrat, Connecticut), chairman of the Senate-House Committee on Atomic Energy, tonight announced recovery of the pint-sized “brown bottle” which had contained uranium 235 missing from the atomic laboratory in Chicago.

Then we had the Washington Post story of the 3d to which I referred a while ago.

As I say again, I am not criticizing the chairman on this matter, but I am merely putting these in to indicate that I had assumed from the repeated press stories following this conference that an announcement had been made.

The CHAIRMAN. I think, Senator, that I can clear up perhaps in part, how that came about.

A brief press conference was held in my office. Sitting on the desk was a brown bottle which contained vitamin pills. [Laughter.]

When asked or queried about the bottle, my eye lit on this bottle of vitamin pills, and I picked it up, and it was said, “Oh, it is something like this,” and, of course, it was brown, and I rather think that that was the origination, and certainly no one was to blame for it; it was just one of those things that happened. That is the way the brown became fixed.

Then, later, when talking about the bottle that was dug up in Chicago, there was no reference to its color; but naturally the reporters were certainly warranted—and I was in error in not making clear when I pointed to the vitamin bottle and held it up, that I was not warranting its color and, perhaps, that is the origination of it and if so, of course, it is my fault.

At any rate, I think the testimony, both given and what is to come, will substantiate beyond a doubt that it was not a brown bottle. It was not a brown bottle that was in question.

Now, it seems to use that we want to make progress, particularly about the Chicago people, to get them back there to their work; and it might be well if the two gentlemen whose handwriting was on the bottle in question that was dug up would come forward at this time for very brief examination.

Now, which one of you two gentlemen first wrote upon the label on the bottle?

**STATEMENTS OF RICHARD DUNSWORTH, JUNIOR METALLURGIST,  
ARGONNE NATIONAL LABORATORY; AND PAUL FIELDS, CHEMIST,  
ARGONNE NATIONAL LABORATORY**

Mr. DUNSWORTH. I did.

The CHAIRMAN. What is your name, sir?

Mr. DUNSWORTH. Dunsworth.

The CHAIRMAN. Your first name?

Mr. DUNSWORTH. Richard.

The CHAIRMAN. And you are a scientist, physicist, employed in the Argonne Laboratory?

Mr. DUNSWORTH. Junior metallurgist.

The CHAIRMAN. Junior metallurgist, and in the course of your duties, did you have occasion to label a quantity of brown oxide enriched?

Mr. DUNSWORTH. That is black oxide.

The CHAIRMAN. Black oxide? I have got "brown" on my mind. [Laughter.]

Mr. DUNSWORTH. Well, I must have.

The CHAIRMAN. I will have this mislabeled if I am not careful.

Mr. DUNSWORTH. I have no recollection of the actual labeling on the bottle, but the handwriting seems to be mine, so I must have done it.

The CHAIRMAN. You do identify—you have identified, and so now identify to us—

Mr. DUNSWORTH. The handwriting.

The CHAIRMAN. The handwriting that is on the label.

Now, what particular numbers are in your writing?

Mr. DUNSWORTH. I would have to check the label again, but the main body on the label is mine. There are some numbers at the bottom, as I recall, that were not mine, although then they might have been mine, because when you are writing on a bottle you are liable to get your figures a little crossed.

The CHAIRMAN. It is pretty difficult, a pretty difficult thing, to write on it. Now, did you identify your handwriting in the presence of an agent of the Federal Bureau of Investigation, Mr. Paxman?

Mr. DUNSWORTH. I did.

The CHAIRMAN. And you informed him that it was your handwriting that was on this bottle?

Mr. DUNSWORTH. Yes.

The CHAIRMAN. Could we, Mr. Borden, have these pictures to refresh the witness' recollection? Well, these are pictures of the bottle, but I doubt if that—here are the pictures. I doubt whether you can

identify them from that picture. I am informed it shows up a little better on this one here [indicating]. Can you decipher it on those pictures?

Mr. DUNSWORTH. Yes. The "585.3G" and the "284.5—284.0G."

The CHAIRMAN. And that is in your handwriting?

Mr. DUNSWORTH. Definitely, yes.

The CHAIRMAN. And the "284.G" represents what?

Mr. DUNSWORTH. Well, "G" stands for grams.

The CHAIRMAN. Right.

Mr. DUNSWORTH. "284.0" is 284—

The CHAIRMAN. Two hundred and eighty-four grams of what?

Mr. DUNSWORTH. Well, there is a "U-30" something. It is clearer on the original bottle. It is called "U-308" right here.

The CHAIRMAN. Senator Hickenlooper is referring to the file, so I will go ahead and develop it as far as I can. But you definitely recognize that as your handwriting?

Mr. DUNSWORTH. That is right.
